P R E F A C E.

IF we consider Man as an inhabitant of the Earth, as a reasonable Being endued with curiosity, as a member of Society, and as connected by commerce, and the interchange of arts and manufactures, with the most distant nations, few studies can appear of such importance, or procure more rational, more useful entertainment, than that of Geography. How great are the intellectual advantages arising from the contemplation of the different Religions, Manners, and Customs of our fellow-creatures! How adapted is this pleasing study, not only to gratify the most unbounded curiosity, but to enlarge the mind, to banish prejudices, and to make us set a just estimate on our real characters and advantages! By examining the History of the human Heart, and the uncultivated Mind, in various regions, where the absurdest Prejudices usurp the place of Reason; and Cruelty, Vice, Folly, and Tyranny are sanctified by the venerable name of Religion; we shall see how much we owe to Education, to the Embellishments of Science, and to the purity of our Holy Religion---how much we are indebted to Providence for many peculiar blessings---how much to Heaven and our brave Forefathers, for the System of Religious and Civil Liberty handed down to us!

Even the various face of the Countries, from the sultry Tropics to the frozen Poles, must afford a constant source of amusement and delight. Here are extensive plains and gently rising hills, enamelled with flowers and adorned with fragrant groves; while, with these blessings, the wretched inhabitants faint under the too ardent rays of the scorching sun, and bend under the yoke of slavery. There sandy deserts, displaying a dreary waste: here lofty mountains, raising their snowy summits above the clouds. What a pleasing amusement will the most curious species of Trees and Shrubs, of Birds and Beasts, of Insects and Reptiles, of Amphibious Animals and Fishes, of Fossils and Minerals, afford the inquisitive mind! The Reader will insensibly know the astonishing works of Nature, and will become acquainted with Natural History almost without design. While he who is versed in the Transactions of Antient Times, will see once populous cities only distinguished by splendid ruins; and the capitals of mighty empires destroyed, and lying in the midst of deserts. The Man of Humanity, and the Friend of Liberty, will, through this work, have frequent cause to pity the unhappy nations subject to the despotic tyranny of lewd and ambitious princes: fertile countries rendered deserts by lawless rapine, and the few inhabitants involved in all the miseries most dreadful to Human Nature. On the other hand, the Artist and the Manufacturer will, with pleasure, view the rude or more finished works of different countries; and the Merchant be instructed in the produce of every Nation.

This,

THE PREFACE.

This, however, is not the first attempt that has been made towards an Universal System of Geography; but as this science is always improving by new discoveries, and countries being better known, this work has advantages which no others, at the time they were written, could possibly possess; the compiler being furnished with many excellent materials since published.

He has endeavoured to avoid dwelling on dry and uninteresting particulars, and to express himself in an easy, intelligible, and entertaining manner. All possible care has also been taken to expunge the errors and fabulous accounts that have been too often copied from injudicious and romantic authors. For this purpose he has compared different descriptions of the same countries, and chiefly relied on persons of acknowledged veracity and good sense, who were eye-witnesses of what they described; and makes a proper distinction between the sentiments of the ignorant, the illiterate, the superstitious, and those of persons distinguished by their genius and learning, who examine with philosophical exactness, and describe with accuracy.

No expence has been spared in the great variety of COPPER-PLATES, containing Maps and remarkable Landscapes, perspective Views of Cities, Palaces, and Ruins, &c. in which this Work exceeds every other of the kind yet published, by which means the reader will have a more adequate idea of what is described, than he could possibly receive from mere verbal Descriptions, unaccompanied by these ornamental Explanations.

This edition has been carefully revised, and considerably improved, by the compiler's having recourse to the fresh materials that have since come to hand. Whatever mistakes or omissions there were in the former edition, it is but justice to add, that they were not owing to the late Mr. FENNING, who, indeed, undertook to perform a part of the work, but other business prevented his writing any more than the Introduction, which was entirely by his hand. After this acknowledgment, it becomes necessary to add, that the candour and indulgence of the public, shewn by the speedy sale of large impressions of this work, have filled the compiler with the highest gratitude, and that in revising it for this edition, he has endeavoured to render it as complete as the nature of the subject will admit.

LONDON, September 1, 1770.

J. COLLYER.

Of the EARTH in general.

THE earth is that terraqueous globe which we inhabit, and is called the fourth of the six primary planets.

The ancients, it is evident, were unacquainted both with its figure and motion; some supposing it to be flat, others in the form of a cylinder; but it is plain, from the appearances of all the phenomena of nature, such as the rising and setting of the sun, moon, and stars, and particularly in the observation of the eclipses, that the earth is nearly spherical, because the shadow of the moon cast upon its surface is circular, which would not be were it not a globe, or nearly so; for, according to the observations of Monsieur Richer, Sir Isaac Newton, Mr. Huygens, and other the best mathematicians, there is about twenty-one or twenty-two miles difference in the diameter of the earth, viz. the diameter at the equator being about so much more than from pole to pole, it being there flattened a little, and therefore is not a true geometrical sphere, but rather an oblate spheroid.

The diameter of the earth is about 7964 miles (commonly expressed 8000) its circumference in square miles about 25,020, and its magnitude or solidity in cubic miles about 199,250,205: the diurnal, or daily motion round its own axis from west to east is about twenty-three hours fifty-six minutes (commonly expressed twenty-four hours) and its annual motion or periodical time round the sun is nearly three hundred and sixty-five days six hours nine minutes, or a year: the circumference of her orbit is nearly 508,939,200 miles, so that its daily motion round the sun is about 1,394,353 miles, her hourly motion about 58,098 miles, and the hourly motion round its own axis about 1042 miles; amazing celerity, which highly sets forth infinite power and wisdom!

The knowledge of arriving at these properties of the earth and heavens is attained by the study of those two excellent sciences called Astronomy and Geography; the last of which we intend to treat of, in as full and conspicuous a manner as possible.

Of GEOGRAPHY in general.

Geography is that science which treats of the globe of the earth, and instructs us in the knowledge of land and water, by pointing out to us those properties which depend on quantity.

Geography is divided into two parts, Universal and Particular.

Universal Geography considers the earth in general without regard to particular countries, and treats more of the situation of the globe itself, its magnitude, figure, motion, &c.

Particular Geography not only considers the situations and constitution of each separate country, but also informs us of their various laws, customs, religions, manners, &c. and acquaints us with every remarkable discovery on the surface of the earth; such as oceans, seas, lakes, rivers, rocks, gulphs, mountains, islands, &c. together with the various position of the inhabitants in respect of each other, their different climates, rising and setting of the sun, length of days and nights, &c. and therefore this particular method of instruction is by some called Historical Geography. In short,

The study and practice of this noble science always was, and now is, thought worthy the attention of the first class of mankind: it is esteemed one of the principal qualifications of polite literature, and according to the knowledge in, or want of it, education is more or less complete.

But why should Geography be called a study? — It is nothing more than to read and remember matters of fact: therefore any person who attends to what is laid down in this system, may easily attain a competent knowledge both of Universal and Particular Geography in a short time.

Of the DIVISION of LAND and WATER.

The globe is divided into four quarters, which by some geographers are called Europe, Asia, Africa, and America; but we have treated first of Asia for several reasons, which are given under that head in the System itself.

These four quarters are again subdivided into ten nominal parts, viz. 1. A continent. 2. An Island. 3. A Promontory, or Cape. 4. A Peninsula. 5. An Isthmus. 6. An Ocean. 7. A Lake. 8. A Bay. 9. A Gulph: and, 10. A Streight. The first five of which are land, and answer to the other five parts of waters, by corresponding numbers, as follows:

LAND.

1. A Continent is a large tract, or vast extent of main land, not separated by any ocean. Thus Europe, Asia, Africa, &c. are Continents.

2. An island is a tract of land surrounded with water, as Great Britain, Ireland, Madagascar, &c.

3. A Promontory, or Cape, is a portion or part of land running far into the sea, as Cape Verde, Cape of Good Hope, &c.

WATER.

1. An Ocean, or Sea, is a large extent or collection of waters, free from land; such as the Atlantic or Western Ocean, the Indian Ocean, &c.

2. A Lake is a tract of water surrounded by land; as the lake of Geneva, the Dead Sea, the Caspian Sea, &c.

3. A Bay is a portion or part of the sea running far up the main land; as the Bay of Biscay, Bay of Siam, &c.

LAND-

L A N D . .

4. A Peninsula is a part or portion of the earth, almost surrounded with water, save only a narrow part or neck of land which ties or unites it to a continent; as Africa itself, Jutland, &c.

5. An Isthmus is a narrow part of land, by which a peninsula is joined to a continent, or main land; as the Isthmus of Panama, which joins North and South America together, the Isthmus of Corinth, &c. &c.

W A T E R .

4. A Gulph, or inland sea, is a part of the ocean almost surrounded with land, save some strait or narrow gut of water by which it has communication with the ocean, as the Gulph of Arabia, the Mediterranean Sea, &c.

5. A Streight is a narrow passage or part of the sea, which joins one sea to another; as the Streights of Gibraltar, which join the Mediterranean Sea to the Atlantic Ocean, the Streights of Babelmandel, &c. &c.

A farther Description of the GLOBE of the EARTH, with the imaginary great Circles and Appendants belonging.

Great circles are such as cut the globe in two equal parts, passing through the centre: all such as do not cut the sphere in two parts are called lesser circles. There are six in number, viz. the Equator or Equinoctial, the Ecliptic or Zodiac, the Brazen Meridian, the Horizon, and the Colures.

1. *Of the EQUATOR.*

The Equator on the Terrestrial, or Equinoctial on the celestial globe, is a line, or circle, that cuts the globe in two equal parts, dividing the north from the south; and upon the artificial globe is easily known by two broad lines running parallel to each other, and a fine hair line between them: it is divided into three hundred and sixty equal parts, called degrees, beginning at the first meridian, (or sign Aries) and is marked from 1 with 10, 20, 30, 40, &c. to 360 quite round: and on some globes you will find a cypher (o) at the meridian of London under the Equator, and runs on to 10, 20, 30, &c. to 180 degrees east, called east longitude; and 10, 20, 30, &c. to 180 to the left hand, to shew the west longitude.

2. *Of the ECLIPTIC and ZODIAC.*

The Ecliptic is another great circle of the sphere, which cuts the Equator at the two points Aries and Libra, making an angle at each point of twenty-three degrees thirty minutes, which is its furthest, or remotest extent, either north or south, from the Equator.

The Zodiac is a broad imaginary circle, which extends itself (according to the rules of astronomy) eight degrees on each side of the Ecliptic, and is that which contains the twelve signs, and in which the planets perform their revolutions. The line in the middle drawn parallel is called the Ecliptic, because eclipses happen in or near the line. It is also called *Via Solis*, the Sun's path-way or motion. But in our modern Astronomy, it is that circle or path that the earth describes to an eye placed in the centre of the system, viz. the sun.

The Ecliptic (like the Equator) is divided into three hundred and sixty degrees, but not numbered from 1, 10, &c. as the Equator, but is divided into twelve equal parts, containing thirty degrees each, which are called Signs, and have different names and characters; six of which are North, and six South, viz.

The six Northern SIGNS.

♈ Aries. ♉ Taurus. ♊ Gemini. ♋ Cancer. ♌ Leo. ♍ Virgo.

The six Southern SIGNS.

♎ Libra. ♏ Scorpio. ♐ Sagittarius. ♑ Capricorn. ♒ Aquarius. ♓ Pisces.

The Signs which stand opposite to each other shew the different seasons of the year; thus Aries ♈ shews Spring, Libra ♎ is Autumn, Capricorn ♑ Winter, and Cancer ♋ Summer. Their significant names are Aries ♈, or the Ram; Taurus ♉ the Bull; Gemini ♊ the Twins; Cancer ♋ the Crab; Leo ♌ the Lion; Virgo ♍ the Virgin; Libra ♎ the Scales; Scorpio ♏ the Scorpion; Sagittarius ♐ the Archer; Capricorn ♑ the Goat; Aquarius ♒ the Water-pot; and Pisces ♓ the Fishes.

N. B. The Ecliptic cuts or intersects the Equator, or Equinoctial, at the two points, or signs, Aries ♈ and Libra ♎, viz. on the twenty-first day of March and twenty-second of September, N. S. on which days the sun is in the Equator, and has no declination either north or south, therefore days and nights are then equal to all the inhabitants on the globe of the earth.

3. *Of the MERIDIAN.*

The Meridian is another great circle, which divides the earth in two equal parts. It is represented on the artificial globe by a thick brass hoop, which surrounds it from north to south, and divides the Equator into two equal parts, viz. the east from the west, and is that on which the globe itself is hung, or turns round upon by its axis, the extremities of which are called the Poles.

This Brazen Meridian, like the Equator and Ecliptic, is divided into three hundred and sixty degrees, but with this difference, it is divided into four nineties, as follows: from the Equator to-

ward

ward the North and South Poles, the Meridian is marked with a cypher over the Equator thus (o) and on each side with 10, 20, 30, 40, &c. to 90, which ends in the Equator.

The use of the Brazen Meridian is to shew the latitude of places, and their difference of latitude, either north or south from the Equator: for the latitude of a place is the same as the elevation of the Pole above the Horizon. That is, whatever figures, or number, the Horizon cuts the Meridian in, so many degrees is the Pole elevated, which is the latitude.

4. *Of the HORIZON.*

The Horizon is that great circle which divides the Heavens and Earth into two equal parts, one called the Upper, and the other the Lower Hemisphere. There are two sorts, the one called the Sensible, or Natural, the other the Rational, or Mathematical Horizon.

The Sensible Horizon is that which divides the visible part of the Heavens from the invisible; as is that great circle which we see all around us (standing upon any hill, or at sea) and seems as if the Heavens and the Earth coincided or joined together.

The Rational, or Real Horizon, is that which passes through the centre of the earth, and divides it (as was said before) into the Upper and Lower Hemisphere.

This Rational Horizon is represented by that broad wooden circle, lying with its face upward, having two notches cut in it, one on the north and the other on the south part, in which the Brazen Meridian is slipped or moved up and down with pleasure: the Poles of the Horizon are the Zenith and Nadir.

There are four circles on the face of the wooden Horizon, viz.

1. The inner circle, or that circle at the inward edge of the Globe, is divided into twelve equal Parts, or Signs, answering to the twelve Signs in the Ecliptic, with their names likewise prefixed to them: as to this Sign γ is wrote Aries, τ is wrote Taurus, and so of the rest.

Note. Aries γ is in the east, Libra ζ in the west, Cancer σ in the north, and Capricorn ϖ in the south point of the Horizon.

2. Next to these signs is a Calendar of Months, according to the Julian account, or Old Stile (used in England till the year 1752) so that the inward circle being divided into degrees, answers the days of the month: for right against the day is the degree of each Sign the sun enters in on any day; or, *vice versa*, right against the Sign or Degree is the day of the month answering thereto.

3. Next to this is another Calendar, according to the Gregorian account (done by pope Gregory XIII. in the year 1582) called the New Stile, which is eleven days sooner, or before the Old Stile, as may be seen by the position of the Calendar; the tenth of March, in the first or Old Calendar, being right against the twenty-first in the New, or Gregorian Calendar. This New Stile is now used by us in England, as well as in foreign nations, pursuant to an Act of Parliament in 1751.

Lastly, On the outward verge of the Horizon is the circle of the Winds, or Rhumbs, viz. the Mariner's Compass, being 32 in number (beginning at the north): each Point, or Rhumb, contains $11\frac{1}{4}$ degrees; for 32 multiplied by $11\frac{1}{4}$ make 360.

The use of the Horizon is to shew the Rising and Setting of the Sun, Length of Day and Night; also the Rising and Setting of the Stars in any latitude; together with the Azimuth, Amplitude, Almacantar, &c. of the Sun or any Star, and the point they rise or set upon, &c.

5. *Of the COLURES.*

The Colures are two great circles, cutting the Equator at right angles, and pass through the Pole of the World.

The Solstitial Colure is that great circle which passes through Cancer and Capricorn, shewing Winter and Summer.

The Equinoctial Colures pass through Aries and Libra, and shew the Spring and Autumn.

Of the lesser Circles of the SPHERE, commonly called parallel Circles.

All such circles as do not divide or cut the Globe into two equal parts, but cut off any segment or part less than the half, are lesser circles: thus all circles on either side of the Equator, which run parallel with the Equator, are lesser circles, and less than each other as they approach the Poles: such are the Tropics of Cancer and Capricorn, and all such circles.

1. *Of the TROPICS.*

At the sign Cancer, on the north part of the Globe, you will find a circle drawn with a double line from thence round the Globe, parallel to the Equator, which is called the North Tropic, or Tropic of Cancer, being $23\frac{1}{2}$ degrees from the Equator northward, shewing the Sun's greatest northern declension: and at the sign Capricorn, you will find the same sort of circle, which is called the Southern Tropic, being also $23\frac{1}{2}$ degrees from the Equator, and shews the Sun's greatest southern declension, or variation from the Equinoctial.

2. *Of the POLAR CIRCLES.*

There are two small circles lying near the poles, viz. $23\frac{1}{2}$ degrees distance, drawn also with double lines: that on the north is called the Arctic Circle, and that on the south the Antarctic Circle. These circles are the poles of the Ecliptic.

All those inhabitants that live under these lines have their longest day just twenty-four hours, and their longest night the same, save the benefit of twilight, which is but trifling. If you go farther to the Poles, their days are two, three, and four days, six, two, three, four, and six months long.

Of the Names of a SPHERE, shewing the different Position or Situation of the Inhabitants of the Earth.

There are three sorts of Spheres, viz. a Parallel, a Right, and an Oblique Sphere.

1. A PARALLEL SPHERE.

A Parallel Sphere has this position: 1. The Poles are in the Zenith and Nadir; that is, one Pole is right up, and the other underneath. 2. The Equator will be in the Horizon.

The PROPERTY of this SPHERE.

The inhabitants of this Sphere are those that live under the Poles, and have the longest days and nights of any other inhabitants; their shortest day being twenty-four hours long, and their longest six months.

2. A RIGHT SPHERE.

A Right Sphere has this position: 1. The Poles will lie or be in the Horizon. 2. The Equator will pass through the Zenith and Nadir. 3. The Equator and all the lesser circles will cut the Horizon at right angles; viz. perpendicularly.

The PROPERTY of this SPHERE.

The inhabitants of this Sphere are those who live under the Equinoctial Line, or Equator, and have their days and nights always equal; viz. twelve hours each.

3. An OBLIQUE SPHERE.

An Oblique Sphere is the position of the Globe, that has the three following properties; viz. 1. One Pole is as much above the Horizon as the other is underneath. 2. The Equator is part above and part under the Horizon. 3. The Equator and all the parallel circles cut the Horizon obliquely.

The PROPERTY of this SPHERE.

The inhabitants of this Sphere are those that live in all other parts except under the Poles and Equinoctial Line; and have their days and nights always unequal, except it be on those two days when the sun enters Aries and Libra.

Of the different Names of the Inhabitants of the Earth in respect of their Situation.

These inhabitants lie under different meridians and parallels, and are six in number; viz. 1. Antæci. 2. Periæci. 3. Antipodes. 4. Amphiscii. 5. Periscii: and 6. Heteroscii.

1. *Of the ANTÆCI.*

The Antæci, or Antæcians, are those inhabitants that have the same longitude; that is, lie under the same meridian, but have as many degrees latitude south as we have north.

Their PROPERTY.

1. Their hour is the same as ours, it being noon, &c. with both at the same time. 2. Their days are equal to our nights, and *vice versa*; and 3. Their summer is our winter.

2. *Of the PERIÆCI.*

The Periæcians are those that lie under the same parallel of latitude, on the same side of the Equator, only are distant a hundred and eighty degrees of longitude; viz. a semicircle.

Their PROPERTY.

1. They have contrary hours, being noon with them when it is midnight with us. 2. Their days and nights are the same length of ours. 3. Their season or time of the year is also the same as with us.

3. *Of the ANTIPODES.*

The Antipodes are such inhabitants as have the same latitude south as we have north, but differ a hundred and eighty degrees in longitude; that is, they have opposite parallels and opposite meridians.

Their PROPERTY.

These inhabitants are, as it were, compounded with the former. For, 1. Their hours are contrary, being noon with one when it is midnight with the other. 2. The longest day of the one is the shortest day or longest night to the other: and 3. The four seasons are contrary, their summer being our winter, &c. &c.

4. *Of the AMPHISCII.*

They are so called because their shadows are cast different ways at different times in the year ; that is, their shadow is southward from March to September, and northward from September to March : therefore, it is easy to perceive these are inhabitants living in the Torrid Zone ; that is, between the Equator and the two Tropics.

5. *Of the PERISCII.*

These are so called because they have their shadows go quite round them : such, therefore, are the inhabitants that dwell between the Polar Circles and the Poles : that is, from $66\frac{1}{2}$ degrees of latitude to 90.

6. *Of the HETEROSCII.*

They are so called, as having their shadow cast but one way ; that is, either always towards the north, or always towards the south.

These then are such as live in the Temperate Zone ; that is, between the Tropics and the Polar Circles. Those in the south Temperate Zone have their shadow fall always southward, and those in the north Temperate Zone have their shadows always cast northward, as in England, France, Spain, and almost all Europe.

*Of the ZONES and CLIMATES.*1. *Of the ZONES.*

A Zone, or Girdle, is a tract or space that furrounds the surface of the earth, as a belt or girdle does the body, and are three in number ; viz. 1. Torrid. 2. Temperate : and 3. Frigid Zones.

1. The Torrid Zone extends from the Equator to the Tropic of Cancer northward, and to the Tropic of Capricorn southward $23\frac{1}{4}$ degrees each (very nearly) ; viz. 47 degrees in all.

2. The Temperate Zones extend themselves from the two Tropics to the Polar Circles on both sides the Equator ; viz. 43 degrees each, being together 86 degrees.

3. The Frigid Zones extend from the Polar Circles to the Poles, being each $23\frac{1}{2}$ degrees ; viz. in breadth ; so that $23\frac{1}{2}$, 43, and $23\frac{1}{2}$ makes 90 degrees, the distance from the Equator to either Pole : or rather thus, the Torrid Zones contain 47 degrees, the Temperate 86, and the Frigid 47, in all 180 degrees.

2. *Of the CLIMATES.*

Climates are tracts, or circles, upon the surface of the Globe, of such a certain breadth from the Equator to either Pole, that the length of the artificial day, viz. from the sun-rise to sun-set, is just half an hour longer than in the next Climate nearer the Equator, till you come to the Polar Circles, and then indeed the day differs in each Climate one entire month.

There are sixty Climates in all ; viz. thirty on each side of the Equator, called accordingly North and South ; of these sixty, forty-eight of them extend from the Equator to the Polar Circles, and each differ by half hours ; and the remaining twelve are contained between the Polar Circles and the Poles, each differing one entire month from the other (as was said before) and will more evidently appear by the following table.

A TABLE of the different CLIMATES between the EQUATOR and POLAR CIRCLES.

Climates.	Hours.	Latitude.		Climates.	Hours.	Latitude.	
		D. M.	Breadth. D. M.			D. M.	Breadth. D. M.

An EXPLANATION of the most useful Terms used in Geography and Astronomy.

1. Zenith is that point of the Heavens that is right over head.
2. Nadir is that right point under feet, being directly or diametrically opposite to the Zenith.
3. Zenith's Distance is the number of degrees that the sun or any star wants of ninety degrees when they are upon the Meridian or greatest height.
4. Altitude is height. Meridian Altitude is the greatest altitude, or height, at twelve o'clock.
5. Declination is the distance of the sun, or any star, from the Equator, or Equinoctial, counted on the Brazen Meridian in degrees, and is called North or South, according to which side of the Equinoctial the Declination is.
6. Right Ascension is an arch of the Equinoctial contained between the sign Aries ♈ and the degree of the Equinoctial that is cut by the Brazen Meridian when the sun, or star, is brought to the Meridian.
7. Oblique Ascension is that arch or degree of the Equinoctial contained between the Sign ♈ and the degree of the Equinoctial which is cut by the Horizon at the rising of the sun, or star.
8. Oblique Descension is just the reverse, being the degree of Equinoctial cut by the Horizon at the setting of the sun, or star.

9. Ascensional Difference is the difference of degrees between the Right and Oblique Ascension, which, converted into time by allowing fifteen degrees for every hour, shews how much the sun, or star, rises or sets before or after six: that is, subtract the Oblique from the Right Ascension, tells the ascensional difference.

10. Amplitude is an arch of the Horizon contained between the true east and west points at the rising and setting of the sun, or stars, counted in degrees from the east and west points of the Horizon where they rise and set, and is called North and South Amplitude accordingly.

11. Azimuth is in effect the same as Amplitude, save only with this difference, that whereas Amplitude is only at rising and setting, Azimuth shews the Distance from the east and west points, at any time when the sun, or stars, are above the Horizon.

Note, Azimuth is not expressed alike by all authors: some call it always North or South Azimuth, and reckon the Azimuth from those two points eastward or westward. Others reckon it from the east and west points, either northward or southward, which, I think, is best, they being the two points that Azimuth is nearest to, in our or any lesser latitude, at any hour; however, it matters not which, if you mind this one rule; suppose I say, the sun has sixty degrees Azimuth from the north eastward, it is the same as if I say he has thirty degrees Azimuth from the east northward.

12. Elevation of the Pole is the same as latitude. There are three sorts; viz.

Latitude of a place is its distance from the Equator, either north or south, numbered in degrees on the Brazen Meridian; or, in other words, it is the Elevation of the Pole above the Horizon.

Latitude of Navigation is the distance of a ship from the Equinoctial, counted on the Meridian; so that if a ship sails towards the Equinoctial, she is said to deprels the Pole; and if she sails from the Equinoctial, she is said to raise the Pole.

Latitude of a Star is its distance from the Ecliptic, being an arch of a circle of longitude, reckoned from the Ecliptic towards its Pole, either north or south.

13. Longitude is also of three sorts; viz.

Longitude of a place is an arch of the Equator intercepted between the first Meridian (or point Aries ♈) on the Equator and the Meridian of the place.

Longitude of a Star is an arch of the Ecliptic, counted from the beginning of Aries to the place where the star's circle of longitude crosses the Ecliptic; so that it may be said to be the star's place in the Ecliptic, counted from the point Aries, which cannot exceed an hundred and eighty from the Equinoctial Point.

Longitude in Navigation is an arch of the Equator contained between the first Meridian and the Meridian the ship is in.

Note 1. Longitude of places differ according to what first Meridian they are counted from; for some place their first Meridian at Gratioto, others at Teneriff, and others at Ferrol.

Note 2. In order to find the longitude of any place on the Globe, only observe whether it be east or west; if eastward, then count so many degrees from the point or sign Aries ♈ on the Globe to the right hand; if westward, count so many degrees towards the left, which will be the east or west longitude required: and the difference of the longitude of any two places is no more than their distance from each other counted in degrees on the Equator, or any parallel of latitude in proportion. But,

Note

Note 3. If the longitude be taken from the Meridian of London, and you would then find the place to answer the following table of longitudes, you must remember that you observe how far the first Meridian is placed from the Meridian of London, and add or subtract accordingly: thus, on Senex's Globes, the first Meridian is about eighteen degrees west of London, therefore all places that lie west of the first Meridian will have the longitude degrees less west on the Globe than in the table; but all places that lie to the east or right hand of London, will have their longitude eighteen degrees more on the globe than in the table: thus the Havanna, by the following table, is eighty-four degrees west longitude of London; but you will find it but sixty-six on the Globe, which is eighteen degrees less; and Pekin, a hundred and eleven degrees east longitude in the tables, will by the same rule be eighteen degrees more from the first Meridian on the same Globe.

To find any Place in Maps of Counties.

The metropolis of England is London; therefore you will find London with a cypher at the bottom of the map. Seek then the latitude of the place given on the right or left hand side of the map, counting so many degrees and minutes upwards, and there place your finger; then count from London so many degrees eastward or westward, as the given longitude expresses; then moving this last finger directly upwards in the map till you come to an equal height with the first finger; move the said first finger straight or parallel along till they both coincide, and you will discover the place you sought for.

T A B L E I.

Of the LATITUDE and LONGITUDE of the most principal Places in the known World (according to the latest Observations) from the Meridian of London.

The

The USE of the GLOBES.

PROBLEMS on the TERRESTRIAL GLOBE.

P R O B. I.

The Latitude being given, to rectify the Globe for that Place.

Let it be required to rectify the Globe for the Latitude of London $51^{\circ} 32'$ north, and Madrid $40^{\circ} 10'$ north, proceed thus: Turn the pole on which the dial-plate is fixed towards the verge of the Horizon, slipping or moving the globe backwards or forwards in the notches of the Horizon, till the Horizon cuts the Brazen Meridian in $51^{\circ} 32'$ (viz. a little more than 51 and a half) so is the globe rectified for the latitude of London; that is, the North Pole will then be elevated $51^{\circ} 32'$ above the Horizon; and London being brought to the Meridian, will then be in the Zenith, or right up, and at equal distance from all parts of the Horizon.

Depress the Pole till the Horizon cuts the Brazen Meridian at $40^{\circ} 10'$, and you have then the position of the inhabitants at Madrid; and turning the globe till Madrid comes to the Meridian, you will find it in the Zenith, or top of the globe, under $40^{\circ} 10'$.

Note. If it were required to rectify the globe for south latitude, then you must elevate the South Pole to the given latitude instead of the North Pole; but this is better explained by the next Problem.

P R O B. II.

The Latitude and Longitude of any Place given, to find the same.

First, You are to observe whether the Longitude be reckoned from London, or from the first Meridian; for on some globes the first Meridian begins 23° , on others 20° , and on Senex's globes 18° west of London; but if once you know where the first Meridian is on the globe, it is very easy to know the difference from the Meridian of London.

Example. There are two certain places, one has $17^{\circ} 30'$ north latitude, and $77^{\circ} 5'$ west longitude; the other is $34^{\circ} 30'$ south latitude, and $16^{\circ} 20'$ east longitude from London; I demand what places these are?

Rule. For the first place, I elevate to the North Pole $17^{\circ} 30'$, because it is $17^{\circ} 30'$ north latitude: then I turn the globe to the right hand, or eastward (because the place lies westward) till $77^{\circ} 5'$ upon the Equator, counted from the Meridian of London (which has a cypher thus (o) on the Equator) passes through or under the Meridian: or, in other words, I turn the globe till $77^{\circ} 5'$ westward is brought under the Meridian, and here I fix the globe with a quill thrust in between the globe and the Horizon; then I look under the latitude $17^{\circ} 30'$ (which is the Zenith) on the Meridian a-top of the globe, and under $17^{\circ} 30'$ on the Meridian I find Port Royal, in Jamaica, the place required.

For the second place, I elevate the South Pole (though there is no occasion to elevate the Pole barely to find a place, but it is better, because you have then the real situation of the inhabitants) to the given latitude $34^{\circ} 30'$ south, and then turn the globe till $16^{\circ} 20'$ east longitude of London come under the Meridian; then I look under the latitude $34^{\circ} 30'$ on the Meridian, and just under this I find the Cape of Good Hope, the place required.

P R O B. III.

The Latitude of any Place given, to tell those Places that have the same Latitude.

Definition. All those places that have the same latitude, have the days and nights of the same length at the same time of the year.

Rule. Bring the given place, or places, to the Meridian (suppose London $51^{\circ} 32'$, and Madrid $40^{\circ} 10'$ north) then turn the globe, and all those places that pass under $50^{\circ} 32'$, have the same latitude as London, viz. Prague in Germany, &c. and all those that pass under $40^{\circ} 10'$, have the same latitude as Madrid, which you will find to be Pekin nearly, for one, and many other places.

P R O B. IV.

To tell the Difference of the Latitude of Places.

Here are two variations, or rules.

First, If the latitudes be both north or both south, then subtract the less from the greater latitude, and the remainder is the difference, or answer. Thus between London and Madrid is $12^{\circ} 32'$, the first being $50^{\circ} 32'$, and the other 40° . And between Candy and Stockholm is $42^{\circ} 30'$, for Stockholm is about $59^{\circ} 30'$ north, and Candy $7^{\circ} 30'$ north.

Secondly, If one place lie on the north, and the other on the south side of the Equator; (that is, if one be north and the other south latitude) then add them both together, and the sum is the difference of the latitude required.

Thus Copenhagen is $55^{\circ} 40'$ north, and the island of Madagascar is $19^{\circ} 30'$ south; these added together make $75^{\circ} 10'$, the difference of latitude required.

P R O B. V.

The Longitude of any Place given from any Meridian, to tell those Places having the same Longitude.

This is done after the same manner as the other, only here the answer will be on the Equator, as the others were on the Meridian.

We would know what places have the same longitude as London, and the same longitude as Moscow.

The Rule is, bring London to the Meridian, then all those places on the globe (from the North Pole, to the south part of the Horizon) that lie under the edge of the Meridian, have the same longitude as London. Thus Fort Nassau, and Fort Mina, in Guinea, have the same, or very nearly the same longitude as London.

And Moscow, in Muscovia, has very nearly the same longitude as Aleppo, in Syria: also Scanderoon, Antioch, and Tripoli, in Syria, have the same longitude, viz. between 37° and 38° east of London.

P R O B. VI.

To find the Difference of the Longitude of Places.

Definition. No place can exceed or be above 180° of Longitude from another place; for 181° east longitude is with more propriety 179° west longitude, for 181° taken from 360° there remain 179° , which is nearer to the given place than 181° .

Rule. Here are two variations.

First, If the places lie both east or both west of the first Meridian, or where you reckon the longitude from, viz. if they both be east or both be west longitude, then subtract the one from the other, you have the difference.

Thus Jerusalem is found $36^{\circ} 15'$ east longitude from London, and Pekin 117° east longitude; therefore subtract $36^{\circ} 15'$ from 117° , and there remains $80^{\circ} 15'$ difference of longitude east or west; that is, Pekin is $80^{\circ} 15'$ east longitude of Jerusalem; or Jerusalem is $80^{\circ} 15'$ west longitude of Pekin.

Secondly, If one place be east and the other west longitude of the first Meridian (suppose London, or any other Meridian) then add their longitudes together, and the sum is the difference of longitude required.

Example. To know the difference of the Longitude between Jerusalem $36^{\circ} 15'$ east of London, and Port Royal in Jamaica $77^{\circ} 5'$ west.

Here, as one is east and the other west, add $36^{\circ} 15'$ and $77^{\circ} 5'$ together, and their sum makes $113^{\circ} 20'$ difference of longitude: that is, Jerusalem is $113^{\circ} 20'$ east of Port Royal, or Port Royal is $113^{\circ} 20'$ west of Jerusalem.

Example. Pekin in China is 117° east longitude; and Port Royal is $77^{\circ} 5'$ west; add these sums together, and $194^{\circ} 5'$ will be found the difference of longitude; but because it is more than 180° , subtract $194^{\circ} 5'$ from 360° , and there remain $165^{\circ} 55'$ the difference required.

Most of the following Problems are common to both globes.

P R O B. VII.

The Day of the Month given, to find the Sun's Place in the Ecliptic.

Rule. The day of the month being given, look on the inner calendar on the new globes, and you have the sign and degree of that sign that the sun is in for that day, according to the New Style.

If it be upon old globes, look on the outward calendar, you have the sign and the degree of the sign.

N. B. It may be further observed, that the calendar used through Europe, is the calendar for N. S. viz. New Style, and is always known from the other, because it has the saints days, and several other things wrote upon it on the Horizon.

Example. To know the sun's place on the Ecliptic on May the 21st, N. S. March the 21st, June the 21st, September the 22d, and December the 21st.

Look for these days of the month in order as they stand in the new calendar; (viz. for N. S. before described) and right against the day of the month, in the innermost circle on the Horizon, is found the sun's place among the signs as follows:

Thus right against May the 21st is found ♊ of II Gemini : and also on March the 21st is found he enters ♈ Aries: on June 21st he enters ♋ Cancer: on September the 22d he enters ♎ Libra: and on December the 21st he enters ♏ Capricorn.

Note. That in every problem and operation hereafter, except Old Style be mentioned, it is to be understood for New Style, viz. N. S. and latitude always means north latitude, except expressed south.

P R O B. VIII.

The Sun's Place given, to find the Day of the Month.

This is only the reverse of the former problem; having the sun's place given, seek it in the innermost circle among the signs; then against that degree in the calendar N. S. you have the Day of the month required.

Example.

Example. To know what time of the year the sun is in 1° of Π , as also when he enters γ , φ , ω , and ν : proceed according to the rule, and you will find the days to be May the 21st, March the 21st, June the 21st, September the 22d, and December the 21st, as in the last.

P R O B. IX.

The Latitude and Day of the Month given, to find the Sun's Place in the Ecliptic, and rectify the Globes for Use.

Rule. Find the sun's place on the Horizon by *Prob. vii.* and having noted what degree he is in, look upon the Ecliptic on the globe, and find the same sign and degree as you did on the Horizon; then bring this degree of the Ecliptic very carefully to the graduated edge of the Brazen Meridian; and holding the globe steady, turn the index exactly to the upper twelve, (which represents twelve at noon) and thus is the globe rectified for that day; and the degree of the Ecliptic that lies under the Equator represents the sun's place at noon, or twelve o'clock, that day.

Note. The Astronomer's day is reckoned from or begins at twelve o'clock; and if you fix the quadrant of altitude to the latitude in the Zenith, the globe will be compleatly rectified.

P R O B. X.

To find the Declination of the Sun on any Day of the Year.

Rule. Having found the sun's place in the Ecliptic for the given day, bring it to the Brazen Meridian, and observe what degree of the Meridian it lies under, and whether it be on the north or on the south side of the Equator, for that is the declination required, which is called north or south declination accordingly. Thus on April the 21st the sun has $11^{\circ} 30'$ north declination, and on May the 21st he has $20^{\circ} 30'$ declination, but on October the 27th he has $12^{\circ} 30'$ south declination.

P R O B. XI.

The Latitude and Day of the Month given, to tell the Sun's Meridian Altitude, viz. his Height at Noon.

Rule. Bring the sun's place to the Meridian, and observe what degree of the Meridian the sun's place is under; for those degrees on the Meridian that are intercepted, or lie between the south verge of the Horizon, and the degree which is over the sun's place on the Meridian, (counted on the Meridian) is the sun's Meridian altitude required.

Thus is found his Meridian altitude at London, May the 21st, to be 59° ; but on November the 5th he has but $23^{\circ} 30'$ altitude.

P R O B. XII.

The Latitude and Day of the Month given, to tell the Sun's Altitude at any Time.

Example. On May the 21st, at nine in the morning, and at five in the afternoon at London, to know the sun's altitude or height.

Rule. Rectify the globe for the latitude, and bring the sun's place ($1^{\circ} \Pi$) to the Meridian, and the index to the upper twelve on the dial-plate; then skrew the quadrant of altitude in the Zenith, (viz. the left edge of the nut must be fixed on the Meridian at $51^{\circ} 32'$) then turn the globe till the index points to the hour, viz. nine in the morning; this done, fix the globe by thrusting in a quill between it and the Horizon: lastly, turn the quadrant about till the graduated or figured edge touch the sun's place, (viz. $1^{\circ} \Pi$) and the degree on the quadrant, counted from the Horizon upward on the quadrant, is his height at that time, viz. $43^{\circ} 30'$. Then turn the globe till the index points to five in the afternoon; and also turn the quadrant on the west side, (without unskrewing it) till it touches the sun's place, and you have about 24° on the quadrant, his altitude at that time.

N. B. At North Cape (viz. north latitude 72°) at nine in the morning May 21, he will be but about 32° high.

P R O B. XIII.

The Latitude given, to tell the Rising and Setting of the Sun, and Length of the Day and Night at any Time of the Year in any Place.

Rule. Rectify the globe, (viz. elevate it for the latitude, bring the sun's place to the Meridian, and index to the upper twelve) then turn it till the sun's place comes even with, or lies right against the inner verge on the east side of the Horizon, then the index will shew you the time of the sun's rising: turn it to the west side, or verge of the Horizon, and the index will shew the setting. Or thus, having got the hour the sun rises, count how many it wants of twelve, for so many hours will it set after. Thus, if the index points to four in the morning at rising, it will of course set at eight at night, &c.

Note 1. If you double the time of rising, that is, double the hours it wants of twelve at the time of rising, it gives you the length of the day from sun-rising to sun-setting.

Note 2. If you subtract the length of the day, from sun-rising to sun-setting, from twenty-four, the remainder shews you the length of the night, twilight included.

Proceed thus, and you will find the sun, on May 26, at London, to rise about four in the morning, and set at eight at night. Now double what he wants of twelve at rising, viz. eight hours, and it gives the length of that day at London, viz. sixteen hours.

P R O B. XIV.

To tell the Sun's right Ascension.

Bring the sun's place to the Brazen Meridian, and note what degree of the Equator is cut by the Meridian, for that is his right ascension required.

To know the sun's right ascension on March the 21st, June the 21st, September the 22d, and December the 21st.

Find the sun's place for these different days, and bringing it to the Meridian, it is found the Meridian cuts the Equator in 0, in 90, in 180, and in 270, his right ascension required.

Note. When the sun enters ♈, March the 21st, he has no right ascension, because it is counted from, or begins at ♈; therefore, on March the 20th, he must have his greatest right ascension, viz. 359°.

P R O B. XV.

To find the Sun's oblique Ascension and Descension at any Time, and in any Latitude.

Rule 1. Rectify the globe for the latitude, and bring the sun's place down to the eastern verge of the Horizon, then observe what degree the Horizon cuts the Equator in, for that is the oblique ascension required.

2. Turn the globe till the sun's place come to, or lies level with the western verge of the Horizon, and the degree of the Equator cut by the Horizon is the oblique descension required.

Thus on March the 21st, June the 21st, September the 22d, and December the 21st, viz. when the sun enters ♈, ♈, ♋, and ♏, you will find his oblique ascension will be 0, 56, 180, and 304.

And on the same days his oblique descension will be 0, 123, 180, and 237 and a half.

P R O B. XVI.

The Latitude and Day of the Month given, to tell the Sun's ascensional Difference, viz. how much he rises or sets before and after six; and consequently to tell the Length of the Days, suppose there was no Index to the Globe.

Rule. By the last problem find the sun's right and oblique ascension; then subtract the oblique from the right ascension, or the contrary, and the remainder is the ascensional difference required; which divide by fifteen, the degrees of the Equator that pass through the Meridian for one hour (or seven and a half for half an hour) gives the answer in time that the sun rises and sets before and after six.

Thus on May the 26th is found the sun 6° of ♊, and his right ascension is 64°, and on the same day his oblique ascension is 34°; now 34° from 64°, there remain 30°, his ascensional difference; which divided by fifteen gives two hours, the time that he rises before or sets after six.

N. B. The right exceeds the oblique ascension from ♏ to ♋, when the sun rises before six: but the other half year that he rises after, or sets before six, the oblique exceeds the right ascension.

P R O B. XVII.

The Latitude and Day of the Month given, to tell the Sun's Amplitude, viz. his Distance from the East and West Points at his rising and setting, and the Points of the Compass he rises and sets upon.

Rule. The globe being rectified, bring the sun's place to the eastern verge of the Horizon, (which shews his rising) then the degrees upon the innermost circle of the Horizon, counted from the true east point to that point in the Horizon, which is opposite the sun's place on the globe, shews you the sun's amplitude.

Proceed according to the rule, you will find the sun's amplitude at London (May the 21st) at rising to be about 34° from the east to the north, and at setting 34° from the west to the north, and the point he rises upon is north-east by east, and sets north-west by west. But on November the fifth he has about 25° and a half amplitude from the east to the south, and at setting 25° and a half from the west to the south. The point he rises upon is east-south-east, and the point he sets upon is west-south-west.

P R O B. XVIII.

The Latitude and Days given, to tell the Sun's Azimuth, viz. his Distance from the East and West, or from the North and South Points at any Time.

Rule. Rectify the globe in general, then turn the globe till the index points to the given hour; this being done, turn the quadrant till it touches the sun's place for the given day; and then the quadrant will cut the Horizon in the Azimuth required from the east or west points, or from the north or south points, for you may reckon from either, only then name it properly and accordingly.

Thus on August the 17th, at nine in the morning, the sun will have about 30° Azimuth from the east to the south; or, which is the same, 60° from the south to the east, for 60° and 30° make 90°, the whole quarter from east to south.

N. B. Some authors call this 60° south amplitude; but others call it 30° south amplitude; that is, 30° from the east to the south, as was said before.

P R O B. XIX.

The Latitude, Day, and Hour given, to tell the Sun's Almacantar.

Definition. Almacantars are circles of Altitude that run parallel to the Horizon, whose poles are the Zenith and Nadir; so that you may imagine as many circles of altitude, viz. Almacantars, as you please.

Rule. The almacantar is found the same as the altitude of the sun at any time, therefore we refer you back to *Prob. xiii.*

P R O B. XX.

The Latitude and Length of the Day given, to tell what other Day of the Year will be of the same Length.

Rule. Having found the sun's place for the given day, bring it to the Meridian, and observe well its declination; then turn the globe till some other degree of the Ecliptic comes under the same degree of declination under the Meridian; this being done, see what day of the month answers to the sun's place then under the Meridian, for that is the day required, which you may easily prove.

Thus you will find that July the 13th, and August the 20th, is of the same length as May the 26th, and April the 17th.

P R O B. XXI.

The Latitude and Day given, to tell the Beginning, Ending, and (consequently) the Length, or Continuance, of Twilight.

Definition. Twilight is that faint light which begins immediately after the sun sets in the evening, and continues till he is 18° below the Horizon; and it begins in the morning when the sun comes within 18° of the Horizon on the east side, and ends when he rises: therefore it is plain, that twilight is not only longer when days increase in length, but it is also much stronger, as you will see by the work of the problem.

Observation. You were told that twilight begins and ends when the sun is 18° below the Horizon and as the quadrant of altitude reaches no lower than the Horizon, therefore the Rule is this:

Rectify the globe, and bring the opposite degree of the sun's place to the quadrant of altitude, so that it touches just 18° on the quadrant, (then it is plain that the sun's real place will be depressed 18° below the Horizon); then look on the index, for that will point (if among the morning hours) to the beginning, or (if among the evening hours) ending of twilight.

Note 1. What is meant by the opposite place of the sun, is this; it is that degree of the Ecliptic opposite to (or 180° from) the given place of the sun. Thus, suppose the sun was in γ , then bring its opposite sign (viz. ϖ) to 18° on the quadrant, so will γ be depressed 18° , and the index will shew the hour.

Note 2. There is no real night at London (but twilight) from May the 22d to July the 20th, the sun all that time being less than 18° below the Horizon.

Proceed then according to the Rule, and you will find that on March the 21st, and September the 22d, twilight begins about four in the morning, and ends about eight at night.

The sun on these days you know, rises and sets at six. Add, therefore, the length of morning and evening twilight to twelve hours, (the length of the days then) and it gives sixteen hours; this subtracted from twenty-four hours, leaves eight hours, the length of the real or dark night.

So also on April the 24th twilight begins about half past two, and ends about half past nine, which is in all seven hours. But on December the 20th it begins at six, and ends at six, which is in all but three hours and forty minutes.

P R O B. XXII.

The Hour given, where you are to tell what Hour it is in any other Part of the World.

Rule. Bring the given place to the Meridian, and set the index at the given hour; then turn the globe till the other place, or places, come under the Meridian, and the index will point to the real time in the place required.

Example. When it is two o'clock in the afternoon at London, to know the time at Jerusalem, and at Port Royal in Jamaica.

Proceed according to the Rule, and you will find, that when it is two in the afternoon at London, it is twenty-five minutes past four at Jerusalem; and but fifty-two minutes past eight in the morning at Port Royal.

Or thus, by *Prob. vi.* Jerusalem is $36^{\circ} 15'$ east longitude of London: divide therefore $36^{\circ} 15'$ by fifteen, and the quotient is two hours, and the remainder is six, which is six times four, or twenty-four minutes, and the odd fifteen minutes, or miles, is one minute; so that the difference is two hours twenty-five minutes: and as Jerusalem is east of London, it has its hour before us, therefore it is twenty-five minutes after four in the afternoon. And thus for other places.

P R O B. XXIII.

The Day of the Month given, to tell those Inhabitants that will have the Sun in their Zenith (or over their Heads) on that Day.

Observation. This cannot happen to any other inhabitants but in the Torrid Zones, that is, to all such as have not above 23° and a half of latitude, either north or south.

Rule. Bring the sun's place to the Meridian, and observe exactly his declination for that day; then turn the globe any way, and observe what places pass under that degree of declination on the Meridian; for all such will have the sun right over their heads some time or other on that day.

To know what inhabitants, or places, will have the sun in their Zenith on May the 21st.

Proceed as directed by the Rule, you will find St. Jago in Hispaniola, St. Jago in Cuba, Campeachy, and many other places will pass under that degree of declination, (viz. 20° north) and will have the sun in their Zenith that day.

Also on April the 16th the inhabitants of Porto Bello, the Oroonoko islands, Bay of Siam, Isle of Ceylon, and the Philippine islands, will have the sun that day in or near their Zenith.

P R O B. XXIV.

The Day and Hour given in any Place, to tell those Inhabitants, or that Place, to which the Sun is then vertical, viz. in the Zenith.

Rule. Bring the given place to the Brazen Meridian, and turn the index to the given hour; this done, turn the globe till the index points to the upper twelve, or noon; then look under the degree of declination on the globe for that day, for that is the very spot, or place, to which the sun is then vertical.

Example. On May the 13th, at eight minutes past five in the afternoon, at London, to know what place has the sun then in Zenith. *Answer.* Port Royal in Jamaica.

N. B. There are two days in which the sun is vertical to all the inhabitants in the Torrid Zones; which must be when the sun has the same declination, and in this Problem will be July the 27th, viz. the same declination as on May the 13th.

Thus also you will find when it is thirty-three minutes past six in the morning at London, on April the 12th, and August the 28th, the inhabitants at Candy, in the island of Ceylon, will have the sun then nearly in their Zenith.

P R O B. XXV.

*To tell the Distance from one Place to another in Degrees and Minutes (viz. Miles) in an Arch of a great Circle: * as also their Bearing, or Situation, in respect of each other.*

Rule. Bring one of the places to the Meridian, and elevate the globe for the latitude of it, and fix the quadrant in the Zenith: then turn the globe till the quadrant touches the other place, and the degrees on the quadrant between place and place shew the distance; and the quadrant at the same time will cut the Horizon in the point of the compass, called the bearing, or situation, from the first place.

Example. To know the distance from London to Port Royal, Jerusalem, and Moscow; as also their situation in respect of London.

Proceed according to the Rule, and you will find that from London

	Deg.		Miles.
To Port Royal	$68\frac{1}{4}$	} viz. nearly {	$4760\frac{3}{4}$ W.
To Jerusalem	$33\frac{1}{4}$		2311 E. S. E.
To Moscow	23		1598 $\frac{1}{2}$ E. N. E.

P R O B. XXVI.

The Latitude and Day given, to tell what Time the Sun will be due East or West.

Rule. Rectify the globe and quadrant as before directed; then turn the quadrant till it touches the east or west point of the Horizon; this done, turn the globe till the sun's place for the given day comes to the edge of the quadrant (holding the quadrant to the east or west point) so will the index point to the hour of his being due east or west on that day.

Proceed thus, and you will find above five minutes past seven in the morning, on May the 21st at London, the sun will be due east, and about five minutes before five in the evening due west. On June the 21st he will be due east about twenty-two minutes past seven in the morning, &c. but on December the 21st he is due east about thirty-five minutes past four in the morning, and due west about twenty-five minutes past seven in the evening.

P R O B. XXVII.

To find the Antæci to any Place, (Suppose London.)

Bring London to the Meridian, and count on the Meridian from the Equator as many degrees latitude south as London has north, (viz. $51^{\circ} 32'$) and there make a dot, for that is the place of the Antæci.

P R O B. XXVIII.

To find the Periæci to any Place.

Bring London to the Meridian, and turn the globe till 180° of longitude pass under the Meridian, then under the same latitude as London, (viz. under $51^{\circ} 32'$ north latitude) make a dot, for that is the place of the Periæci, to be in the Great South Sea $51^{\circ} 32'$ south latitude, and 180° longitude.

Thus also the Antipodes to Cape Antonia in South America is the Bay of Nankin in China: and the Antipodes to Barbadoes is a little shoal in the Straights of Sapy.

* *Note.* Sixty miles, or minutes, are reckoned a degree in general; but this is a vulgar error, for it is proved that every degree on the earth's surface in every great circle (such as the Equator, Meridian, &c.) is sixty-nine miles and a half; therefore multiply the degrees by sixty-nine and a half, you have the distance in English miles.

P R O B. XXIX.

To find the Antipodes.

There are three ways, but the two best are these:

1. Bring London to the north verge of the Horizon; which is done by flipping the globe up and down till London lies close to the edge of the Brazen Meridian, and close to the Horizon on the north: this being done, look on the south verge of the Horizon close to the Brazen Meridian, and there make a dot on the globe, and you have the Antipodes.

2. Bring London to the Meridian, and turn the globe till 180° pass through the Meridian, and there fix the globe; then count from the Equator southward on the Meridian $51^\circ 32'$, and you will find the same dot to lie close to the Meridian (at $51^\circ 32'$) below the south part of the Horizon.

P R O B. XXX.

The longest Day in any Latitude given, (supposing London sixteen Hours and a Half) to tell in what other Latitude the longest Day is one, two, three, &c. Hours longer than in the given Place.

Rule. Rectify the globe for the given latitude, (viz. London) and bring the solstitial Colure (viz. \mathfrak{S}) to the Meridian; then where the Horizon cuts the Tropic of \mathfrak{S} make a dot on the Tropic at the verge of the Horizon: this done, turn the globe westward, till 7° and a half of the Equator pass under the Meridian, and then make a second dot on the Tropic against the Horizon as before; then turn the globe back to its first position (viz. to \mathfrak{S} , and then elevate the pole, till the second dot appears at the edge of the Horizon, and the Horizon at the same time will cut the Meridian in the latitude required.

Proceed as above, and you will find that in the latitude $56^\circ 20'$, the days are one hour longer than at London.

2. If you want to know the latitude where the day is two hours longer than at London, then proceed as before, only instead of causing 7° and a half to pass under the Meridian, you must now turn the globe till 15° pass under the Meridian, and make then a second dot on the Tropic, and proceed as before.

Note. If you want to know the latitude where the longest day is an hour shorter than at London, only turn the globe eastward instead of westward, till seven degrees and a half pass through the Meridian, and make a prick on the Tropic, and depress the pole till this lies even with the Horizon, you will find the latitude about 45° and a half. Thus for two hours longer about 60° , for four hours about $64^\circ 20'$; but for two hours shorter the latitude is about 35° and a half.

P R O B. XXXI.

Any Time not exceeding six Months given, to tell that Latitude, or those Places, where the Sun will not set for all that Time.

Note. That twenty-eight days are here reckoned to the month. Bring the given time into days, and take the half of the number of days; but remember to abate one if the half exceeds thirty; then count from Cancer on the Ecliptic the same number of degrees as the half amounted to, and where this reckoning ends make a dot on the Ecliptic. Lastly, Bring this dot to the Meridian, and as many degrees as are intercepted, or lie between the dot and the pole itself, counted on the Meridian, is the latitude required.

Example. The place, or latitude, is demanded where the sun does not set for the space of four months and sixteen days.

This is in all one hundred and twenty-eight days, the half is 64° , abate 1° is 63° ; this I count from \mathfrak{S} on the Ecliptic, and make a dot, and bringing it to the Meridian, it is found there are nearly 80° between the dot and the pole, viz. the latitude is 80° , which is at Smith's Inlet, the upper part of Greenland.

So also in the latitude of 85° , he sets not for five months two weeks. And in the latitude of $86^\circ 30'$, for five months three weeks and three days; and in the latitude 90° , not for six months; as you will see by the next problem.

P R O B. XXXII.

To tell in the Latitude ninety (the longest Day there being six Months) how long it continues to be Twilight after Sun-set; and how long their Night is after Twilight ends, before Twilight begins again.

Note. Remember you were told before, that twilight begins and ends when the sun is 18° below the Horizon, and that on September the 22d, the sun begins to set to the inhabitants at the North Pole, and to rise to the inhabitants at the South Pole; so that twilight begins September the 22d to the inhabitants at the North Pole; therefore

Rule 1. Elevate the pole to the Zenith, and turn the globe till some degree of the sun's place in the Ecliptic lies under 18° of the Brazen Meridian, and under the south part of the Horizon, and you will find it 24° III , viz. November the 14th, the ending of twilight; that is, they have twilight from September the 22d to November the 14th, and then they begin to have dark nights (save the advantage of the moon) till the 24th of January. For,

2. Turn

2. Turn the globe till some other point of the Ecliptic comes under 18° as before, and you will find it about 5° of π , which answers to the 24th of January, the beginning of twilight to the inhabitants at the North Pole, and then on March the 21st he rises with them.

Thus it appears, that the length of their day (from sun-rising to sun-setting) is from March the 21st to September the 21st. The length or continuance of twilight is from September the 21st to November the 14th, and from January the 24th to March the 21st, in all about one hundred and ten days, and their real night is from November the 14th to January the 24th, viz. about seventy-one days.

Note. The same holds good to the southern inhabitants at the South Pole, for he rises with them when he enters to π , and sets with them when he comes to γ , &c.

P R O B L E M S on the C E L E S T I A L G L O B E.

P R O B. I.

To find the right Ascension of any Star.

Bring the centre of the star to the Meridian, and the degree of the Equinoctial cut by the Meridian, is the right ascension required.

Thus you will find the right ascension of Aldebaran in Taurus to be about 65° , Arcturus in Bootes about $210^\circ 45'$, Regel in Orion about $75^\circ 30'$, and Sirius, or the Dog-Star, about 98° , &c. &c.

P R O B. II.

The Latitude given, to tell the oblique Ascension and Descension of any Star.

Rectify the globe, and bring the Star down to the eastern verge of the Horizon, and the degree of the Equinoctial that is then cut by the Horizon, is the oblique ascension required. Turn the star to the western side, and the degree of the Equinoctial cut by the Horizon is the star's oblique descension.

Proceed thus, and you will find the oblique ascension of Regel to be about $86^\circ 30'$, of Marhal in Pegasus about 325° , and of Aldebaran, or Bull's-eye, about $43^\circ 30'$. Turn each of these to the western side, you will find their oblique descension 64° , 360° nearly, and 87° .

Note. There is this difference between the right and oblique ascension and descension of the sun and stars: for the sun's oblique ascension, &c. differs every day in the same latitude, but the stars oblique ascension is every day the same.

P R O B. III.

To tell the Declination of the Stars:

As for the sun's place, so also here, bring the given star to the Brazen Meridian, and observe what degree of the Meridian lies right over the centre of the star, for that is the declination either north or south, according to which side the equinoctial it lies.

Thus you will find the declination of Aldebaran to be about $16^\circ 45'$ north. The upper Pointer to the Pole in Urfa Major about $62^\circ \frac{1}{4}$, and the lower one nearly $58^\circ \frac{1}{4}$, but Regel in Orion I find about $8^\circ \frac{1}{4}$ south, and Cor Scorpio about 26° south declination, &c. &c.

P R O B. IV.

The right Ascension and Declination of any Star given, to find the same at once.

Bring the given degree of right ascension on the Equator to the Brazen Meridian, then look under the degree of declination on the Meridian, and you will find the star at the Meridian under the given degree of declination.

Thus, suppose it was wanted to find Aldebaran, whose right ascension is 65° , and his declination $16^\circ 45'$ north: first bring 65° of the Equinoctial to the Meridian; and looking under $16^\circ 45'$ north, declination on the Meridian, is found Aldebaran.

So also Sirius has 98° right ascension, and $16^\circ 30'$ south declination; therefore bring 98° of the Equinoctial to the Meridian, and looking under $16^\circ 30'$ south declination on the Meridian is found Sirius just at the Meridian. The same for any other star.

P R O B. V.

To tell the rising and setting of the Stars, and the Point of the Compass any Star rises or sets upon in any Latitude, and on any Day of the Year.

Rectify the globe, and bring the sun's place to the Meridian; then turn the globe till the given star comes to the eastern verge of the Horizon, and the index will point to the time of rising, and the Horizon will shew the point it rises upon: turn it to the west, and the index will point to the time of setting, and the Horizon will shew you the point it sets upon.

Proceed thus, and you will find that Aldebaran, on November the fifth at London, rises a little past six in the evening, and sets about nine in the morning. The point he rises upon is east-north-east, and the point he sets upon is west-north-west. But Regel in Orion, the same night, rises a

little before nine at night, and sets about half past seven in the morning. The points of rising are west by south, and setting east by south.

Note. The stars rise and set every day on the same point of the compass, though at contrary hours.

P R O B. VI.

To tell the Time, viz. how many Hours any Star continues above the Horizon, from its Rising to its Setting, in any Latitude.

Rectify the globe, then bring the star to the eastern verge, and note the time of rising; then turn the globe to the western side, and the number of hours that passed through the dial-plate tells you the continuance of that star above the Horizon.

Thus Aldebaran is found at London to continue up from the time of his rising on any day (for example take December 25th) about fifteen hours; and Regel about ten hours and a half.

At Stockholm Aldebaran continues up above sixteen hours; but at Port Royal he continues up but about twelve hours three quarters.

P R O B. VII.

To tell the Distance of one Star from another in Degrees and Minutes, in the Arch of a great Circle.

To this Problem are three variations:

1. If the stars lie under the same Meridian, bring them to the Brazen Meridian, and the degrees intercepted between them, counted on the Meridian, is the distance required.

Thus is found the two Pointers in the Great Bear to be about $5^{\circ}\frac{1}{2}$ distant from each other; and Arides and the Dolphin's Eye about $29^{\circ}\frac{1}{2}$ distant.

2. If they lie under the same declination, bring the first (at pleasure) to the Brazen Meridian, and note the degrees cut by the Equator; then bring the other to the Meridian, and note how many degrees difference has passed through the Meridian, for that is their distance required.

Thus is found the difference between Affengue and Caput Medusæ to be about $122^{\circ}\frac{1}{2}$; for Affengue ($38^{\circ}\frac{1}{2}$ declination) being brought to the Meridian, cuts $277^{\circ} 30'$, viz. $82^{\circ} 30'$ from γ westward; and Caput Medusæ cuts 40° of the Equator eastward; their distance therefore is $122^{\circ} 30'$.

3. If neither of the stars lie under the same degree of the Meridian, or declination, then bring either of them to the Meridian, and elevate the pole to the same height as the star has declination (that is, the same as you elevate the terrestrial globe to the latitude of a place) for then the star will be in the Zenith; therefore fix the quadrant to the Zenith, over the centre of the given star, and extend it to the other star, and the degrees on the quadrant is the distance required in a true arch of a great circle.

Note. Though the distance of the stars from each other are thus determined in degrees, yet you are not to suppose their distance are so many degrees to be converted into English miles; but it only means, that they appear so far distant under such an angle.

Thus is found the distance between Capella and Cor Hydra to be about 79° , and between Aldebaran and Sirius about $46^{\circ} 30'$, &c.

4. If the stars be at such a distance from each other, that the quadrant will not reach them, then bring either of them to the Horizon, and elevate or depress the pole, till the other lies also at the verge of the Horizon, and the degrees counted upon the Horizon, between star and star, is the distance in degrees.

Thus between Aldebaran and Cor Scorpio you will find about 170° .

P R O B. VIII.

The Latitude, Day of the Month, and Height of any Star given, to tell the Time or Hour of the Night.

Rule. Rectify the globe for the latitude, &c. &c. then fix the quadrant in the Zenith, and move the globe and the quadrant together, till the star cuts the quadrant in the given height; and the index will point to the hour.

Thus on January the 21st (at London) in the evening, Aldebaran was observed east-south-east to be about 40° high; the time of this observation is demanded? *Ans.* A little past five in the evening. Again, on December the 25th, in the evening, Sirius was observed to be about 15° high, and at the same time Regel to be about $28^{\circ}\frac{1}{2}$; the hour is demanded? *Ans.* About ten at night; and Aldebaran is under the Meridian at the same time.

P R O B. IX.

To tell what Stars never rise, and those that never set, at London.

1. Only observe what stars have above $38^{\circ}\frac{1}{2}$ north declination; for all such never set at London, but are always above the Horizon.

2. Observe also those stars that have above $38^{\circ}\frac{1}{2}$ south declination, for those never rise, but are always under the Horizon at London.

Thus the Pointers in the Great Bear, Arides in Cygnus, and many others, never set.

Also Canopus in Argo, Navis and Pes Centaurus, and many others, never rise at London.

Note 1. From what has been said it is easy to conceive, that to the inhabitants under the North Pole no south star can ever be seen; nor can the inhabitants at the South Pole ever see one of the stars in the other hemisphere. But,

2. The inhabitants under the Equator have a pleasant sight of all the stars from pole to pole; for they rise and set with them at right angles; therefore no star can continue above twelve hours above this Horizon.

P R O B. X.

To know at any Time of the Year (in the Latitude of London) where to find any Star, or to tell the Name of any Star at pleasure.

Rectify the globe for the day, and turn it till the index points to the given hour; then by a quadrant take the height of the required star; or, for want of this (in a common way of guessing) observe well what part of the heavens it is in, viz. whether east-north-east, south-west, or the like; as also its height as near as you can guess. This being done, set the globe in due order for the day and hour, and you will find the same star on the globe; and, by applying the quadrant, you will find the exact point of the compass, and the real height the star then has, which though not perhaps near to what you guessed it at, yet, if it be any noted star, you may assure yourself you were right, as there is no other star of note near it about that height, and upon the same point.

Thus, on December the 25th, at eight at night, was observed a bright star (as near as can be guessed) on the south-east point, and about 48° high; It is desired to know what star it is? *Ans.* Aldebaran.

I rectify the globe, and turn the index to the hour, and then turn the quadrant to the given point of the compass, and looking about 48° high on the quadrant, Aldebaran is found to be the nearest bright star by the quadrant on that point and height; therefore I conclude it is Aldebaran.

Also at three quarters past ten, the same night, was seen two very bright stars, one on, or near the Meridian, about 30° high, and the other near the south-east point, and about 35° high; I demand their names? *Ans.* Regulus and Procyon in Canicula.

P R O B. XI.

To tell the Latitude and Longitude of the Stars.

First, Observe whether the given star be on the north or south side of the Ecliptic; for if it be on the north side, elevate the North Pole $66^{\circ}\frac{1}{2}$, and turn the globe till \odot and φ lie in the north and south points of the Horizon, viz. the Ecliptic will be parallel, or even to the Horizon, and fix the quadrant in the Zenith: then, keeping the globe steady, turn the quadrant till the edge of it touches the centre of the star; and that degree on the quadrant, viz. the altitude of the star in the latitude $66^{\circ}\frac{1}{2}$, is the latitude required, and the degree of the Ecliptic cut by the quadrant, reckoned from Aries (or rather reckoned among the signs, as it happens) is the longitude required.

Thus you will find Arcturus in Bootes to be about $30^{\circ}\frac{1}{2}$ north latitude, and 230° longitude from φ or rather 23° of π . Also, Alcair is about $29^{\circ}\frac{1}{2}$ of north latitude, and 28° of longitude in φ .

2. *For any south Star.* Elevate the South Pole $66^{\circ}\frac{1}{2}$, and fix the quadrant in the Zenith, and apply it to the star, as before directed, you have the latitude and longitude required. Thus you will find Pes Centaurus to have about $42^{\circ}\frac{1}{2}$ of south latitude, and 236° longitude from φ , or rather 26° in π ; and thus for any other star.

P R O B. XII.

The Latitude and Day of the Month given (suppose December the 25th, at 9 at Night at London) to set the Globe so as to represent the Face of the Heavens at that Time, and shew your Acquaintance the Name and Position of the most eminent fixed Stars.

Rectify the globe for the latitude, and bring the sun's place to the Meridian, and the index to twelve; then turn the globe to the given hour, viz. five minutes past nine at night, and there fix it, so will every star on the globe (if you set the globe north and south) correspond with, or point to the same star in the heavens.

Thus (at London) is found Capella east by south about 75° high, Castor and Pollux, one about 40° , and the other about 45° high, near the east point: Procyon below them, to the left hand, 23° high east-south-east: Sirius yet lower, to the left, south-east about 10° high: Betelgeuze higher, on the same point, about 38° high; Regulus, more southward, about 26° high: Aldebaran, on the same point, much higher, viz. about 53° : the Seven Stars, or Pleiades, south nearly about 62° high: Menkar, south by west 40° high: Arides, north-west about 26° high, &c. &c.

P R O B. XIII.

To tell the Time of the acronical Rising and Setting of any Star.

Definition 1. The acronical rising of a star is when the star rises just at the sun-set.

2. A star is said to set acronically when it sets with the sun.

Bring the sun's place for the given day to the western side of the Horizon, and all those stars that are on, or near the eastern side of the Horizon, rise acronically; and those on the western verge of the Horizon set acronically.

Thus it is found on December the 6th, that Aldebaran rises acronically, but it sets acronically on May the 21st. Also Sirius rises acronically on February the 4th, and sets acronically on May the 14th.

P R O B. XIV.

To tell the cosmical Rising and Setting of the Stars in any Latitude.

Definition 1. A star is said to rise cosmically when it rises with the sun.

2. A star is said to set cosmically when it sets at sun-rising.

Rectify the globe, &c. and bring the sun's place to the eastern side of the Horizon for the given day; then all those stars cut by the eastern verge of the Horizon rise cosmically. The globe still remaining in the same position, look at the western verge or edge of the Horizon, and all those stars cut by it, or that are very near it, set on that day cosmically.

Thus is found that Arcturus, and two small stars in Hercules's Thigh, rise cosmically September the 25th. Also two stars in Eridanus, Aspengue in Lyra, &c. &c. set cosmically. Marshal in Pegasus is but just below the Horizon, therefore may be said to set nearly cosmically, as it will within a day or two.

For the cosmical Setting. Turn the globe till the star comes to the western side of the Horizon, and observe the degree of the Ecliptic then cut by the eastern side of the Horizon, for that will answer to the day of the cosmical setting.

Thus Arcturus sets cosmically June the 22d; also Aldebaran sets cosmically December the 20th.

P R O B. XV.

To tell the heliacal Rising or Setting of the Stars;

Definition 1. Heliacal rising is when a star once in the sun's beams gets out of them, so as to be seen at the eastern verge of the Horizon, just before sun-rising.

2. Heliacal setting is when a star once in the sun's beams gets out of them, so as to be seen setting on the western side of the Horizon, just after sun-set.

Note 1. This heliacal rising and setting of the stars is different, according to their different magnitudes. For,

Note 2. Stars of the first magnitude are seen rising and setting, when the sun is but 12° below the Horizon. Stars of the second magnitude are not perfectly seen till the sun is 13° below the Horizon. Those of the third degree, when he is 14° . Those of the fourth degree of magnitude when he is 15° below the Horizon. Those of the fifth degree, when he is 16° . Those of the sixth degree, when he is 17° ; and the nebulous, or small ones, not till he is 18° below the Horizon, viz about the beginning and ending of twilight.

To find the heliacal rising or setting, the Rule is, rectify the globe, and bring the given star to the eastern verge of the Horizon; then fix the globe, and turn the quadrant to the western side, till 12° of the quadrant touches the Ecliptic; this done, note the degree of the Ecliptic that is cut by 12° of the quadrant on the western side, (for then will the real place of the sun be depressed 12° on the eastern side) for that degree sought in the calendar gives the heliacal rising. The same is to be observed with the quadrant on the eastern side of the heliacal setting. Thus you will find Aldebaran rises heliacally July the fourth, sets heliacally May the fifth: and Sirius, the Dog Star, rises heliacally about August the 26th.

Note. The poets, and others, formerly used to reckon their *Dies Caniculares* or Dog Days, from the heliacal rising of Sirius; but they did not agree when they ended. Some reckoned them to continue thirty or forty, and others fifty days. However, in this they agreed, that the weather at that time was very sultry and faint for five or six weeks after the rising of Sirius. But (as it was then, so now) it is a ridiculous whim; for Sirius does not now rise heliacally till near September, though our Almanack-makers (for what reason is not known) continue the beginning of Dog Days July the 30th. But, however, it is plain that Sirius can no ways be charged with bringing this sultry weather; because three or four thousand years hence he will not rise heliacally till November, and then, perhaps, will be charged with bringing as much cold by the same rule.

P R O B L E M S in N A V I G A T I O N.

P R O B. I.

The Sun's Declination and Hour when he is due East given, to find the Latitude, viz. the Elevation of the Pole.

Rectify the globe to the same latitude as the given number of degrees of declination, and fix the quadrant in the Zenith; then convert the hours that the sun is due east before, or after, six o'clock into degrees, and count the same number of degrees on the Horizon from the east point southward, and bring the quadrant to that degree of the Horizon, so shall the degree on the quadrant that is cut by the Equator be the complement of latitude; which taken from 90° , gives the latitude itself, or height of the pole.

Example. Sailing May the 21st, an observation was made that the sun was due east about seven minutes past seven in the morning, and his declination $20'$ north; it is demanded what latitude I was in?

Proceed by the Rule, you will find the latitude to be $51^{\circ}\frac{1}{2}$ nearly.

P R O B.

P R O B. II.

Having the Sun's Azimuth at Six o'Clock, and Declination, to find the Latitude.

Rule. As many degrees as are contained in the Azimuth given, so much elevate the pole, and fix the quadrant in the Zenith, and bring γ to the Meridian; this done, count on the quadrant upwards the complement of the sun's declination to ninety, and bring that degree to the Equator; then the degree of the Horizon cut by the quadrant, shall be the complement of latitude, counted from the south point, or else from the north, as it may happen, and the remainder to ninety is the latitude required; or otherwise, the degrees counted from the other two cardinal points, either east or west, as it may happen, will give the latitude.

Thus is found the sun's azimuth, at six o'clock, to be $12^{\circ} 15'$, and his declination $20^{\circ} 10'$, what is the latitude? Work according to the rule, you will have the answer $38^{\circ} \frac{1}{2}$ complement, that is, $51^{\circ} \frac{1}{2}$ latitude required.

P R O B. III.

The Sun's Amplitude and ascensional Difference given, to find the Elevation of the Pole, and Sun's Declination.

Rule. Raise or elevate the pole so many degrees as is the ascensional difference, and fix the quadrant in the Zenith, and bring γ to the Meridian; then count on the quadrant upwards the complement of altitude, and move the quadrant till that same number on the quadrant cuts the Equator; and the quadrant will cut the Horizon in the degree of the pole's elevation, and the Equator in the degree of declination.

P R O B. IV.

The Sun's Altitude East, and his Declination given, to prove the Elevation of the Pole.

Rule. Elevate the pole to the complement of the sun's altitude at east, and fix the quadrant in the Zenith, and bring γ to the Meridian; then number on the quadrant of altitude, the degree of declination, and bringing the same to the equator observe what degree the quadrant cuts the Equator in; for its complement to 90° is the height of the pole.

Example. The sun's declination is $20^{\circ} 10'$ north, his altitude at east (at London) is nearly 26° , it is desired to know whether the supposed latitude ($51^{\circ} \frac{1}{2}$) agrees herewith in operation.

Here subtract 26° from 90° , and there remains 64° complement of altitude, and elevate the pole accordingly, &c. Then bring γ to the Meridian, and cause $20^{\circ} 10'$ on the quadrant to cut the Equator, and you will find it nearly $38^{\circ} \frac{1}{2}$, the complement of latitude required: which subtracted from 90° gives $51^{\circ} \frac{1}{2}$, the real latitude of the place.

P R O B. V.

The Sun's Declination and Amplitude given, to find the Height of the Pole.

Rule. Elevate the pole to the complement of amplitude, and fix the quadrant in the Zenith, and bring γ to the Meridian; then count the sun's declination on the quadrant, and bring that degree to the Equator; and the degree of the Equator cut by the quadrant is the latitude required.

Example. Suppose the sun's amplitude $33^{\circ} 20'$, his declination $20^{\circ} 10'$, what is the latitude?

Proceed according to the rule, you will find it about $51^{\circ} 30'$.

On the different Systems of the WORLD.

THE motions of the heavenly bodies have, from the infancy of time, engaged the attention of mankind, and various hypotheses have been proposed to account for them, some of which were formed and forgotten in the same age; and the rest, namely, the Ptolemaic, the Brahean, and Composite systems, preserved only as monuments of ancient inventions. As the Copernican, or true solar system, is now universally adopted by every one that deserves the name of an astronomer, we shall lay before our readers a copious explanation of that system.

The Copernican system places the sun in the centre, and supposes that the planets and comets revolve about it at different periods of time, and at different distances from it, in the following order.

Mercury, at the distance of about 32,000,000 of miles, revolves about the sun in the space of 87 days, 23 hours, and 16 minutes.

Venus, at the distance of 59,000,000 of miles, in 224 days, 16 hours, and 49 minutes.

The Earth, at the distance of about 82,000,000 of miles, in 365 days, 6 hours, and 9 minutes, or a Sydereal year.

Mars, at the distance of 123,000,000 of miles, in 686 days, 23 hours, and 27 minutes.

Jupiter, at the distance of 424,000,000 of miles, in 4332 days, 12 hours; and 20 minutes, or almost 12 years.

Saturn, at the distance of 777,000,000 of miles, in 10,759 days, 6 hours, and 36 minutes, or nearly 30 years.

The comets in various, and vastly eccentric, orbits revolve about the sun in different situations and periods of time, but too numerous to be inserted here; nor is their theory yet sufficiently known to calculate exactly their periodical times.

These are all the heavenly bodies yet known to circulate about the sun, as the centre of their motions; but among the planets there are three which have secondary planets, satellites, or moons, revolving constantly about them, as the centres of their motions; namely, the Earth, Jupiter, and Saturn.

The Earth has only one satellite or moon; which revolves about it in 27 days, 7 hours, 43 minutes, at the mean distance of about 240,000 miles.

Jupiter is observed with a telescope to have four satellites or moons constantly moving about him. The first in 1 day, 18 hours, 27 minutes, at the distance of 65 semidiameters from his centre, as measured with a micrometer. The second in 3 days, 13 hours, 13 minutes, at the distance of 9 semidiameters. The third in 7 days, 3 hours, 42 minutes, at the distance of 14.5 semidiameters. The fourth in 16 days, 16 hours, 32 minutes, at the distance of 25.5 semidiameters.

Saturn has five moons continually moving round him. The first, or that nearest the body of the planet, revolves about him in 1 day, 21 hours, 18 minutes. The second in 2 days, 17 hours, 41 minutes, at the distance of almost two and a half semidiameters. The third in 4 days, 12 hours, 25 minutes, at the distance of three and two thirds semidiameters. The fourth in 15 days, 22 hours, 41 minutes, at the distance of 8 semidiameters. The fifth in 70 days, 22 hours, 4 minutes, at the distance of 23.3 semidiameters.

But, besides these satellites, he is surrounded by a thin broad ring, as an artificial globe is by its horizon. This ring appears double when seen through a good telescope. It is inclined thirty degrees to the ecliptic, and is about 21,000 miles in breadth, which is equal to its distance from Saturn on all sides. There is reason to believe, that the ring turns round its own axis; because when it is almost edgeways to us, it appears somewhat thicker on one side of the planet than on the other; and the thickest edge has been seen on different sides at different times.

The comets are solid opaque bodies, with long transparent tails, issuing from that side which is opposite to the sun. They move about the sun in very eccentric ellipses, and are of a much greater density than the earth; for some of them are heated in every period to such a degree, as would vitrify or dissipate any substance known to us. Sir Isaac Newton computed the heat of the comet which appeared in the year 1680; when nearest the sun, to be 2000 times hotter than red hot iron, and that, being thus heated, it must retain its heat till it again approaches the sun, even though its period should be 20,000 years, and it is computed to be only 575. It is believed, that there are at least twenty-one comets belonging to our system, moving in all sorts of directions; and all those which have been observed have moved through the ætherial regions and the orbits of the planets, without suffering the least sensible resistance in their motions; which sufficiently proves that the planets do not move in solid orbits. Of all the comets, periods of three only are known with any degree of certainty; and of these, that which appeared in 1680, is by far the most remarkable. This comet at its greatest distance is about 12 thousand 200 millions of miles from the sun, and at its least within a third part of the sun's semidiameter from his surface. In that part of its orbit, which is nearest to the sun, it flies with the amazing velocity of 880,000 miles in an hour; and the sun, as seen from it, appears 100 degrees in breadth, consequently 40,000 times as large as he appears to us. The astonishing distance that this comet runs out into empty space, suggests to our minds an idea of the vast distance between the sun and the nearest fixed stars, within whose attraction no comet must approach, that returns periodically round the sun.

The extreme heat, the dense atmosphere, the gross vapours, the chaotic state of the comets, seem, at first sight, to declare them absolutely uninhabitable, altogether unfit for the purposes of animal life, and a most miserable habitation for rational beings : and hence some are of opinion, that they are so many hells for tormenting the wicked with perpetual vicissitudes of heat and cold. But when we consider, on the other hand, the infinite power and goodness of the Deity, the latter inclining, and the former enabling him, to make creatures suited to all stages and circumstances ; that matter exists only for the sake of intelligence ; and that, wherever we find it, we find it pregnant with life, or necessarily subservient thereto ; the numberless species, the astonishing diversity of animals in earth, air, water, and even in other animals ; every blade of grass, every tender leaf, every natural fluid, swarming with life ; and every one of these enjoying such gratifications as the nature and state of each requires : when we reflect, moreover, that some centuries ago, till experience undeceived us, a great part of the earth was judged uninhabitable ; when we consider, I say, these particulars, and a thousand others that might be mentioned, we shall have reason to think, that such numerous and large masses of durable matter, as the comets undoubtedly are, however unlike they may be to our earth, are not destitute of beings capable of contemplating with wonder, and acknowledging with gratitude, the wisdom, symmetry, and beauty of the creation ; which is more plainly to be observed in their extensive tour through the unbounded fields of space, than in our more confined circuit.

Of the Motion and Figure of the E A R T H.

WE have already observed, that the earth revolves round the sun between the planets Mars and Venus ; and that it also revolves about its own axis in twenty-four hours. The latter produces the vicissitudes of day and night, and the former the change of the seasons. The revolution round its axis is from west to east, which causes all the heavenly bodies to move apparently the contrary way, namely, from east to west. This is very easily conceived ; but its annual motion round the sun is attended with more difficulty, and therefore we shall endeavour to explain it.

It is easy to conceive, that the sun will always enlighten one half of the earth, and that when the sun is in the equinoctial, the circle which terminates the enlightened and darkened hemispheres, called the circle of illumination, will pass through the poles of the earth, dividing the parallels of latitude into two equal parts : but as the earth does not move in the plane of the equinoctial, but in that of the ecliptic, the axis of the earth will be inclined to that of the ecliptic in an angle of 23 deg. 29 min. and therefore the circle of illumination will at all other times divide the parallels of latitude into two unequal parts.

Now, since any parallel is the path or tract which any place therein describes in one revolution of the earth or 24 hours, therefore that part of the parallel, which lies in the enlightened hemisphere, will represent the diurnal arch, or length of the day ; and that part in the dark hemisphere will be the nocturnal path, or length of the night, in that parallel of latitude.

Hence, as the earth always moves with its axis parallel to itself, and always inclined to the plane of the ecliptic, the northern parts will one time of the year be more turned towards the sun, and consequently more enlightened than the southern ; and the other part of the year the southern parts will enjoy the same advantage. Hence various alterations of heat and cold, and length of days and nights, will ensue in the course of the revolution of the earth about the sun, which will constitute all the variety of seasons.

We will begin the earth's motion on the 21st of March, when the earth is in Libra, and consequently the sun appears to be in Aries, and is the vernal equinox. In this position of the sun all parts of the earth are equally enlightened from pole to pole, and all the parallels of latitude divided into two equal parts by the circle of illumination ; consequently the days and nights will be equal, and the sun's heat at a mean between the greatest and least ; particulars that constitute the agreeable season we call spring.

As the earth passes from west to east through Libra, Scorpio, and Sagittarius, to the beginning of Capricorn, the sun will appear to move through the opposite signs of the ecliptic ; namely, Aries, Taurus, and Gemini, to the beginning of Cancer ; during which time, by the inclination of the earth's axis, the northern parts will be gradually turned towards the sun, and the southern parts from it ; the enlightened parts of the arches of the parallels of latitude in northern parts will also increase, and those of the southern decrease ; consequently the length of the days will increase in the former and decrease in the latter. And when the sun reaches Cancer, it will be the middle of that season we call summer in north latitude ; but in south latitude it will be the winter season.

The north frigid zone is, during the time of the sun's being in Cancer, wholly enlightened, and the pole turned as far as possible toward the sun ; but, as the earth moves on, the north pole returns, the diurnal arches grow gradually less, and the nocturnal greater ; consequently the sun's rays fall more and more obliquely, and his heat proportionally diminishes till the earth comes to Aries, when the sun will appear in Libra ; and thus produce an equality of light and heat, and of day and night, to all parts of the world. This will be the middle of the season called autumn, and the day of the autumnal equinox, which happens about the 22d of September.

But as the earth moves on through Aries, Taurus, and Gemini, the sun appears to move through the opposite signs Libra, Scorpio, and Sagittarius ; the north pole is immersed in the dark hemisphere, and the south pole becomes enlightened : the north frigid zone is more and more obscured,

and

and the south more and more enlightened; all the northern latitudes turn continually from the sun, by which means his rays fall on them more obliquely, and pass through a larger body of the atmosphere; the nocturnal arches gradually increase, and the diurnal decrease; all which contribute to form the dismal scene we call winter; the midst of which is when the earth enters Cancer, and the sun appears in Capricorn, which happens about the 21st of December.

Lastly, as the sun continues moving on from thence through Cancer, Leo, and Virgo, the sun appears to pass through Capricorn, Aquarius, and Pisces; and all things change their appearance. The northern climes begin to return, and receive more directly the enlivening beams of the sun, whose meridian height every day increases: the days lengthen, the tedious nights contract their arches, and every thing contributes to advance the delightful season of the spring.

Thus have we followed the earth round her annual orbit; and shewn how the various seasons, and length of the days and nights, are formed by means of the inclination of the earth's axis to the ecliptic. Had the earth's axis been perpendicular to the ecliptic, there could have been no diversity of seasons, nor any difference in the length of the days and nights; no alteration of heat and cold, so agreeable now both to the torrid and frozen zones; but the same uniform eternal round of invariable suns had been our lot, so foreign to the disposition of all mankind, who are charmed with variety, and disgusted with the same perpetual appearance, and undiversified prospect. The obliquity of the ecliptic is therefore not to be looked upon as a matter of chance or indifference, but an instance of wisdom and design in the adorable Author of nature, who does nothing in vain.

Thus we see that the sun appears to change his place daily, so as to make a tour round the starry heavens in a year, yet he is fixed in the centre of the system, and only moves in appearance: for whether it be, in reality, the sun or earth that moves, the phenomena will be the same; no objection therefore can be drawn against the earth's motion, from the apparent motion of the sun.

And it is well known to every person who has sailed on smooth water, or been carried by a current in a calm, that, however fast the vessel goes, he is not sensible of her progressive motion. Now, as the motion of the earth is beyond comparison more smooth and uniform than that of a ship, or any machine made and moved by human art, it is not to be imagined that we can feel its motions. It is, therefore, no argument against the earth's motion that we do not feel it.

If we could translate ourselves from planet to planet, we should still find that the stars would appear of the same magnitudes, and at the same distances from each other, as they do now to us; because the dimensions of the remotest planet's orbit bears no sensible proportion to the distance of the fixed stars. But then the heavens would seem to revolve about very different axes, and consequently these quiescent points, which are our poles in the heavens, would seem to revolve about other points; which, though apparently in motion to us on earth, would be at rest seen from any other planet. Thus the axis of Venus, which lies almost at right angles to the axis of the earth, would have its motionless poles in two opposite points of the heavens lying almost in our equinoctial, where to us the motion appears quickest, because it is performed in the greatest circle. And the very poles, which are at rest to us, have the quickest motion of all as seen from Venus. To the inhabitants of Mars and Jupiter the heavens appear to move round with very different velocities on the same axis, which are about 23 degrees and a half from ours. Were we transported to Jupiter, we should be amazed with the rapid motion of the heavens; the sun and stars appearing to move round in nine hours and fifty-six minutes. Could we go from thence to Venus, we should be as much surprized at the slowness of the heavenly motions; the sun going but once round in 584 hours, and the stars in 540. As it is impossible these various circumvolutions, in such different times, and on such different axes, can be real, so it is unreasonable to suppose the heavens to revolve about the earth more than it does about any other planet. When we reflect on the vast distance of the fixed stars to which 162,000,000 of miles is but a point, we are filled with an amazement at the immensity of the distance; but if we attempt to form an idea of the astonishing rapidity with which the stars must move, if they move round the earth in twenty-four hours, the thought so far surpasses our imagination, that we can no more conceive it than we do eternity, or an infinite number. If the sun moved round the earth in a day, he must travel above 3000 miles in a minute; but as the stars are at least 10,000 times farther than the sun from us, they must move 10,000 times quicker. And all this to serve no other purpose than what can be as fully, and much more simply, obtained by the earth's turning round eastward, as on its axis, every twenty-four hours, causing thereby an apparent diurnal motion of the sun westward, and bringing about the alternate returns of day and night.

As for the expressions in scripture, which seem to contradict the earth's motion, one general answer will be sufficient; namely, that it is abundantly evident to every impartial person, that as the scriptures were never intended to teach men astronomy and philosophy, so the expressions relating to these sciences are not always to be taken in the strictest sense, being adapted to the common apprehensions of mankind. Men of sense, in all ages, when not treating on the sciences, always use the same method; and it would be in vain to follow any other in addressing the bulk of mankind. Moses calls the moon a great light, as well as the sun; but the moon is known to be an opaque body; and the smallest astronomers have observed in the heavens, that the light she casts upon the earth is not her own, but the light of the sun reflected. Many other instances might be given, if necessary; but as every person, who makes any pretension to learning, agrees in admitting the motion of the earth, any thing farther would be superfluous.

The most natural, and at the same time the most certain method of determining the magnitude of the earth, is to measure the length of a degree of latitude on the meridian of any place; because, as every circle is supposed to be divided into 360 degrees, if we find the length of one of these divisions,

and

and multiply it by 360, we shall have the circumference of the earth in some known measure, supposing the earth to be a sphere.

Thus, if we find the latitude of any place, or take the altitude of any known star with a good quadrant, and then proceed directly northward or southward, till we find by the same instrument that the difference of latitude is one degree, or the same star is raised or depressed one degree; it is evident that we must have passed over just one degree of the earth's surface, which might therefore be known by actual mensuration, were it possible to find such a part of the earth's surface exactly even, spherical, and under the same meridian.

But this can hardly be expected, except in some very low and level country, which being overflowed in the winter, and the water converted into ice, the frozen surface might be sufficiently accurate. Accordingly Snellius attempted this in Holland, by measuring the distance between a tower at Leyden and another at Souterwode three times over, and then a straight line in the meridian on the ice: whence, by a trigonometrical process, he measured the length of a degree, but some error in the calculation rendered his intentions abortive. This induced the ingenious M. Muschenbroeck to attempt the same thing anew in the year 1700, by forming triangles on the fundamental base of Snellius, and happily succeeded. According to his mensuration the length of a degree of the meridian in Holland is 69 English miles and 711 yards; which nearly agrees with the mensuration of our countryman Mr. Richard Norwood, who found, by measuring the distance between London and York, in the year 1635, that the length of a degree is 69 English miles and a half.

But though the earth be of a spherical form, yet it is not a true sphere, but flatted at the poles, and the diameter at the equator longer than the axis. This is a natural consequence of its revolution round its axis. For all globes that have a circular rotation will be oblate spheroids; that is, their surfaces will be higher, or farther from the centre in the regions of the equator, than in those of the poles; because, as the former move with a much greater velocity than the latter, they will recede farther from the centre of motion, and consequently enlarge their diameter. That our earth is really of a spheroidical figure, is demonstrable from the unequal vibrations of pendulums; for it has been found that pendulums swinging seconds must be $2\frac{16}{1000}$ lines shorter at the equator than at the poles; a line is the twelfth part of an inch. This discovery, which was made by M. Richer, in the year 1672, engaged the attention of the greatest mathematicians of Europe; and the illustrious Sir Isaac Newton, by a most subtle theory, found, that the two diameters of the earth were in proportion to each other as 229 to 230. And, from accurate mensurations since made in Lapland and Peru, it is demonstrated, that this proportion is very near the truth.

The learned Dr. Long, in the first volume of his *Astronomy*, page 168, mentions an ingenious and easy method of finding nearly what proportion the land bears to the sea; namely, by taking the papers of a large terrestrial globe, and after carefully separating the land from the sea with a pair of scissors, to weigh them accurately in a pair of scales. This supposes that the globes are truly delineated, and that the paper is every where of an equal thickness. The doctor adds, that he actually made the experiment on the papers of Mr. Senex's seventeen inch globes; and found that the sea paper weighed 349 grains, and the land only 214; whence it appears, that almost three fourths of the surface of our earth, between the polar circles and the equator, are covered with water; and that little more than one fourth is dry land. The doctor omitted weighing all within the polar circles, because a sufficient number of observations have not been made in these uncomfortable parts to distinguish, with the necessary accuracy, the proportion between the land and sea.

Of WINDS.

THE air is a fine invisible fluid, surrounding the globe of the earth, and extending to some miles above its surface.

The atmosphere is that collection of air, and the bodies contained in it, that circumscribe the earth.

The air has been found by a multitude of experiments to be both heavy and elastic. By the former it is capable of supporting other bodies, as watery vapours, fumes, and exhalations from different bodies, in the same manner as wood is supported by water: and by the latter, namely, its elasticity, a small quantity of it is capable of being expanded so as to fill a very large space; or of being compressed or confined in a much smaller compass.

A multitude of experiments have also demonstrated that air is compressed or condensed by cold, and expanded or rarefied by heat. Whence it follows, that if an alteration be made by heat or cold in any part of the atmosphere, its neighbouring part will be put into motion, by the endeavour the air always makes to restore itself to its former state; for experiments shew, that either condensed or rarefied air will return to its natural state, as soon as the cause, whatever it be, of that condensation or rarefaction is removed.

Wind is a stream or current of air which may be felt, and usually blows from one point of the horizon to its opposite; as from north to south, from east to west, from south-east to north-west, and the like.

Winds are either constant or variable, general or particular.

Constant winds are such as continue blowing the same way, at least for several hours or days; but variable winds are such as frequently shift within an hour or a day.

A general

A general wind is that which blows the same way over a large tract of the earth during the greatest part of the whole year.

A particular wind is that which blows in any place, sometimes one way, and sometimes another indifferently.

If the wind blows gently, it is called a breeze; if it blows harder, a gale, or a stiff gale; and when very hard, a storm. Experiments have shewn, that the swiftness of the wind in a great storm is about sixty miles an hour; and in a common brisk gale, about fifteen.

The great Dr. Halley, from accurate observations made in several voyages, found

1. That between the limits of sixty degrees, namely, from thirty of north latitude to thirty of south, there is a constant east-wind throughout the year, blowing on the Atlantic and Pacific oceans, called the trade-wind. For as the sun in moving from east to west heats the air more immediately under him, and thereby expands it, the air to the eastward is constantly rushing towards the west, to restore the equilibrium, or natural state of the atmosphere; and this occasions a perpetual east wind within those limits.

2. That the trade-winds near their northern limits, blow between the north and east; and near their southern limits, between the south and east. For as the atmosphere is expanded by the heat of the sun near the equator, the air therefore from the northward and southward will both tend towards the equator, to restore the equilibrium. Now these motions from the north and south, joined with the foregoing easterly motion, will produce those observed near the said limits between the north and east, and between the south and west.

3. That these general motions of the wind are disturbed on the continents, and near the coast; for the nature of the soil may either cause the air to be heated or cooled; and hence will arise motions that may be contrary to the foregoing general ones.

4. That in some parts of the Indian ocean there are periodical winds, called monsoons; that is, such as blow half the year one way, and the other half the contrary way: for air that is cool and dense will force the warm and rarefied air in a continual stream upwards, where it must spread itself to maintain the equilibrium; so that the upper course or current of the air will be contrary to the under current; for the upper air must move from those parts where the greatest heat is, and so by a kind of circulation, the north-east wind below will be attended with a south-west wind above; and a south-east wind below with a north-west wind above: and this is confirmed by the experience of seamen, who, as soon as they get out of the trade-winds, immediately find a wind blowing from an opposite quarter.

5. That in the Atlantic ocean, near the coast of Africa, at about 100 leagues from the shore, between the latitude of 28 deg. and 10 deg. N. seamen constantly meet with a fresh gale of wind blowing from the north-east.

6. That those bound to the Caribbee islands across the Atlantic ocean, find, as they approach the American side, that the north-east wind becomes easterly, or seldom blows more than a point from the east, either to the northward or southward. These trade-winds on the American side are extended to 30, 31, or even 32 degrees north latitude; which is about four degrees farther than what they extend on the African side: also to the southward of the Equator, the trade-wind extends three or four degrees farther towards the coast of Brasil on the American side, than they do near the Cape of Good Hope on the African side.

7. That between the latitude of four degrees north, and four degrees south, the wind always blows between the south and east: on the African side they are nearest to the south, and on the American side nearest the east. In these seas Dr. Halley observed, that when the wind was to the eastward, the weather was gloomy, dark, and rainy, with hard gales of wind; but when the wind veered to the southward, the weather generally became serene, with gentle breezes nearly approaching to a calm. These winds are somewhat changed by the seasons of the year: for when the sun is far northward, the Brasil south-east wind changes to the south, and the north-east wind to the east; and when the sun is far south, the south-east wind gets to the east, and north-east on this side the equator veers more to the north.

8. That along the coast of Guiney, from Sierra Leone to the island of St. Thomas under the equinoctial, which is above 500 leagues, the southerly and south-west winds blow perpetually: for the south-east trade-wind having crossed the equator, and approaching the Guiney coast within 80 or 100 leagues, inclines towards the shore, and becomes south, then south-east, and by degrees, as it comes near the land, it veers about to the south, south-south-west, and close in with the land it is south-west, and sometimes west-south-west. This tract is troubled with frequent calms, violent sudden gusts of winds called tornados, blowing from all points of the horizon. The reason of the wind setting in west on the coast of Guiney is, in all probability, owing to the nature of the coast, which being greatly heated by the sun, rarefies the air exceedingly, and consequently the cool air from off the sea will keep rushing in to the equilibrium.

9. That between the fourth and tenth degrees of north latitude; and between the longitudes of Cape Verd and the eastermost of the Cape Verd islands, there is a tract of sea which seems to be condemned to perpetual calms, attended with terrible thunder and lightning, and such amazing rains, that part of this sea has acquired the name of *the Rains*. Ships in sailing these six degrees have been sometimes detained whole months. The cause of this seems to be, that the westerly winds setting in on this coast, and meeting the general easterly winds in this tract, balance each other, and so cause the calms; and the vapours carried thither by each wind meeting and condensing, occasion the almost continual rains.

10. That between the southern latitudes of ten and thirty degrees in the Indian ocean, the general trade-wind about the south-east by south, is found to blow all the year long in the same manner as in similar latitudes in the Ethiopic ocean; and during the six months between May and December, these winds reach to within two degrees of the equator; but during the other six months, from the beginning of December to the beginning of June, a north-west wind blows in the tract lying between the third and tenth degrees of south latitude, in the meridian of the north end of Madagascar, and between the second and twelfth degrees of south latitude, near the longitude of Sumatra and Java.

11. That in the tract between Sumatra and the African coast, and from three degrees of south latitude quite northward to the Asiatic coast, including the Arabian sea and the Bay of Bengal, the monsoons blow from September to April at north-east, and from March to October at south-west. The shifting of these monsoons is not all at once; and in some places the change is attended with calms, in some with variable winds, and in others with tempests; and such is their violence, that they render the navigation of these parts very unsafe at that time of the year. These tempests the seamen call the breaking up of the monsoons.

We have already observed, that the atmosphere surrounding the earth is an elastic fluid; and its lower parts being pressed by the weight of all the air above them, are squeezed the closer together; and consequently the densest of all at the earth's surface, and gradually rarer the higher they ascend. The weight of air sustained by every square inch at the earth's surface, is found, by experiments on the air-pump, and also by the quantity of mercury the air balances in a barometer, to be fifteen pounds; therefore every square foot must sustain 2016 pounds; consequently every middle sized man, whose surface may be about 14 square feet, is pressed by 28,224 pound weight of air all round; for fluids press equally up and down and on all sides: but because this enormous weight is equal on all sides, and counter-balanced by the spring of the internal air in our blood-vessels, it is not felt. We often feel ourselves languid and dull, and impute the cause to the air's being heavy and foggy about us; but this is a mistake: the cause arises from its being too light, as is evident from the mercury's sinking in the barometer, at which time it is generally found the air has not sufficient gravity to bear up the vapours which compose the clouds; for when it is otherwise, the clouds mount high, the air is more elastic and weighty about us, by which means it balances the internal spring of the air within us, braces up our blood-vessels and nerves, and renders us brisk and lively.

The atmosphere is also the cause why the heavens appear bright in the day-time; for, without an atmosphere, that part of the heavens only would shine in which the sun was placed: and if an observer could live without air, and should turn his back towards the sun, the whole heavens would appear as dark as in the night, and the stars would be seen as clear as in the nocturnal sky. In this case we should have no twilight, but a momentary transition from the brightest sun-shine to the blackest darkness immediately after sun-set; and from the blackest darkness to the brightest sun-shine at sun-rising: but by means of the atmosphere we enjoy the sun's light, reflected from the aerial particles, before he rises and after he sets; for when the earth by its rotation hath concealed the sun from our sight, the atmosphere being still higher than we, has his light imparted to it; which gradually decreases till he has got eighteen degrees below the horizon, and then all that part of the atmosphere above us is dark. From the length of the twilight Dr. Keil calculated the height of the atmosphere, so far as it is dense enough to reflect the light, and found it to be about forty-four miles; but it is seldom dense enough at two miles height to support the clouds.

Of the T I D E S.

BY the tides is meant that motion of the waters in the sea and rivers, by which they are found regularly to rise and fall. The general cause of the tides, or flux and reflux of the sea, was discovered by Sir Isaac Newton, and may be deduced from the following considerations.

Daily experience shews that all bodies thrown upwards from the earth, fall down to its surface in perpendicular lines; and as lines perpendicular to the surface of a sphere tend towards the centre, therefore the lines along which all heavy bodies fall are directed towards the centre of the earth: and as those bodies apparently fall by their own weight or gravity, the law by which they fall is called the law of gravitation.

A piece of glass, amber, or sealing-wax, being rubbed against the palm of the hand or a woollen-cloth till warm, will draw small bits of feathers or other light substances towards it, when held sufficiently near those substances: also a magnet or load-stone, being held near the filings of iron or steel, will draw them to itself; and a piece of hammered iron or steel, that has been touched by a magnet, will acquire a like property of drawing iron or steel to itself. And this property in some bodies, of drawing others to themselves, is called attraction.

Now, as bodies fall towards the earth by their gravity, it is not improper to say it attracts those bodies; and therefore in respect to the earth, the words attraction and gravitation may be used for one another, as they imply no more than the power or law by which bodies tend towards its centre.

The incomparable Sir Isaac Newton, by a sagacity peculiar to himself, discovered, from many observations, that this law of gravitation or attraction was universally diffused throughout the world; and that the regular motions observed among the heavenly bodies were governed by this principle; so that the earth and the moon attracted each other, and were both attracted by the sun: and also that the force of attraction, exerted by these bodies on each other, was less and less as the distance increased, in proportion to the squares of those distances; that is, the power of attraction at double the distance was four times less, at triple the distance nine times less, and so on.

Now,

Now, as the earth is attracted by the sun and moon, all the parts of the earth will not gravitate towards its centre in the same manner as if those parts were not affected by such attractions. And it is very evident, that was the earth entirely free from such actions of the sun and moon, the ocean being equally attracted towards its centre on all sides by the force of gravity, would continue in a perfect stagnation, without ever ebbing or flowing; but since the case is otherwise, the ocean must needs rise higher in those parts where the sun and moon diminish their gravity, or where the sun and moon have the greatest attraction; and as the force of gravity must be diminished most in those places of the earth to which the moon is nearest, or in the Zenith, that is, where she is vertical, her attraction there is consequently most powerful; therefore the waters, in such places, will rise higher than others, and it will be there full sea.

The parts of the earth directly under the moon, and also those that are diametrically opposite, will have high-water at the same time; for either half of the earth would equally gravitate towards the other half, were they free from all external attraction; but by the action of the moon the gravitation of one half of the earth towards its centre is diminished, and the other increased. Now, in that hemisphere of the earth next the moon, the parts in the Zenith being most attracted, and thereby their gravitation towards the earth's centre diminished; therefore the waters in those parts must be higher than in any other part of this hemisphere: and, in the hemisphere farthest from the moon, the parts in the Nadir being less attracted by the moon than in the parts nearer to her, gravitate less towards the earth's centre; and consequently the waters in these parts also must be higher than they are in any other parts of this hemisphere.

Those parts of the earth where the moon appears in the horizon, or ninety degrees distant from the Zenith and Nadir, will have low water: for as the waters in the Zenith and Nadir rise at the same time, the waters in their neighbourhood will press towards those places to maintain the equilibrium; and to supply the places of these, others will move the same way, and so on to the places ninety degrees distant from the Zenith and Nadir; consequently, in those places where the moon appears in the horizon, the waters will have more liberty to descend towards the centre; and therefore in those places they will be the lowest.

Hence it plainly follows, that the ocean, if it entirely covered the surface of the earth, would be of a spheroidal or oval figure, whose transverse or longest diameter would pass through the place where the moon is vertical, and the conjugate or shortest diameter where she is in the horizon; and as the moon apparently shifts her position from east to west in going round the earth every day, the longer diameter of the spheroid following the motion will occasion the two floods and ebbs observable in about every twenty-five hours, which is the length of a lunar day; that is, the interval of time between the moon's leaving the meridian of any place, and her return to it again: so that the time of high-water any day is almost an hour later than it was the preceding day.

The time of high-water is not precisely the time of the moon's coming to the meridian, but about three hours after; for the moon acts with some force after she has passed the meridian, and thereby increases the libratory or waving motion she has put the water into while she was in the meridian; in the same manner, as a small force applied to a ball already raised to some height, will raise it still higher.

The tides are higher than ordinary twice every month; that is, about the times of the new and full moon, and are called spring tides; for at these times, the actions of both the sun and moon concur or draw in the same right line; and consequently the sea must be more elevated: at the conjunction, or when the sun and moon are on the same side of the earth, they both conspire to raise the waters in the Zenith, and consequently in the Nadir: and when the sun and moon are in opposition, that is, when the earth is between them, while one makes high-water in the Zenith and Nadir, the other does the same.

The tides are less than ordinary twice every month; namely, about the first and last quarters of the moon: and are called neap tides; because, in the quarters of the moon, the sun raises the water where the moon depresses it, and depresses where the moon raises the water: so that the tides are made only by the difference of their actions. It must, however, be observed, that the spring tides do not happen directly on the new and full moons, but a day or two after, when the attractions of the sun and moon have acted together for a considerable time. In like manner the neap tides happen a day or two after the quarters, when the moon's attraction has been lessened by that of the sun for several days together.

The spring tides are greater about the time of the equinox, that is, about the middle of March and September, than at any other times of the year; and the neap tides are then also less, because the transverse diameter of the spheroid, or the two opposite high-waters, will at that time be in the earth's equator, and consequently describe a great circle of the earth, by whose diurnal rotation those high-waters will move swifter, describing a great circle in the same time they used to describe a lesser circle parallel to the equator; and consequently the waters, being thrown more forcibly against the shores, they must rise higher.

All things hitherto explained would happen exactly, if the whole surface of the earth was covered with sea: but since this is not the case, and there are a multitude of islands, besides continents, lying in the way of the tide, which interrupts its course; therefore in many places near the shores there arise a great variety of other appearances, besides those already mentioned, which require particular solutions, wherein the situation of the shore, straits, and other objects, must necessarily be considered; for instance, as the sea has no visible passage between Europe and Africa, let them be considered as one

continent, extending from seventy-two degrees north to thirty-four degrees south, the middle between those two will be near Cape Blanco, in the latitude of nineteen degrees north; but it is impossible the flood tide should set to the westward on the west coast of Africa, like the general tide following the course of the moon, because the continent for above fifty degrees north and south bounds that sea on the east; and therefore, if any regular tide, as proceeding from the motion of the sea from east to west, should reach this place, it must either come from the north of Europe southward, or from the south of Africa northward, to the said latitudes on the west coast of Africa.

This opinion is confirmed by common experience, that the flood tide sets to the southward along the coast of Norway, from the North Cape to the Naze, or entrance of the Baltic sea, and so proceeds to the southward along the east coast of Great Britain; and in its passage supplies all these ports with the tide one after another, the coast of Scotland having the tide first, because it proceeds from the northward to the southward; and thus, on the days of the full or change, it is high-water at Aberdeen at forty-five minutes after twelve at night; but at Tinnmouth-bar not till three in the morning. From hence, rolling to the southward, it makes high-water at the Spurn a little after five, but not till six at Hull, by reason of the time required for its passing up the river; from thence passing over the Well-bank into Yarmouth Roads, it makes high-water there a little after eight, but in the Pier not till nine, and it requires an hour more to make high-water at Yarmouth: in the mean time, setting away to the southward, it makes high-water at Harwich at half an hour after ten, at the Nore at twelve, at Gravesend at half an hour after one, and at London at three, all the same day; and though this, at first sight, seems to contradict the hypothesis of the natural motion of the tide being from east to west, yet as no tide can flow west from the main continent of Norway or Holland, or out of the Baltic, which is surrounded by the main continent, except at its entrance, it is evident that the tide we have been now tracing by its several stages from Scotland to London is supplied by the tide, whose original motion is from east to west; and as water always endeavours to maintain a level, it will in its passage flow towards any other point of the compass to fill up vacancies where it finds them, without contradicting, but rather confirming the first hypothesis.

While the tide or high-water is thus gliding along the eastern coast of England, it also sets to the southward along the western coasts of Scotland and Ireland, a branch of it falls into St. George's-channel, the flood running up north-east, as may be naturally inferred from its being high-water at Waterford above three hours before it is high-water at Dublin, and near three quarters ebb at Dublin before it is high-water at the Isle of Man.

But it will be sufficient for our purpose to trace the tides on our own coast; and therefore we shall return to the British channel, where we find the tides set to the southward from the coast of Ireland, and in its passage a branch of it falls into the British channel between the Lizard and Ushant. Its progress to the southward may be easily proved by its being high-water on the full and change at Cape Clear at four, at Ushant at six, and at the Lizard at seven. The Lizard and Ushant may be considered as the chops of the British channel, between which the flood sets to the eastward along the coast of England and France, till it comes to the Galloper or Goodwin-sands, where it meets the tide above-mentioned setting to the southward, along the coast of England to the Thames: where those two tides meeting, greatly contribute to the sending a strong tide up the Thames to London. And hence we may account for a very singular phenomenon that sometimes happens in the river, and has been considered as a prodigy, we mean a double flux and reflux: for when the natural course of the tide is interrupted by a sudden change of the wind, driving one back and the other in, the consequence must be a double flux and reflux, and accordingly it has been twice high-water within three or four hours.

But it will, perhaps, be objected, that this course of the flood tide to the eastward up the channel is quite contrary to the hypothesis of the general motion of the tides being from east to west, and consequently of its being high-water where the moon is vertical, or any where else in the meridian.

But this objection will be easily removed, if we consider, that the particular direction of any branch of the tide doth not in the least contradict the general direction of the whole; a river, whose course is west, may supply canals that wind to the north, south, or even to the east, and yet the river keep its natural course; and if the river ebb and flow, the canals supplied by it will do the same, but not keep exact time with the river; because it would be flood, and the river advanced to some height before the flood reached the further part of the canals, and the more remote the longer time it would require; and it may be added, that if it was high water in the river just when the moon was on the meridian, she would be considerably past it, before it could be high-water in the farthest part of these canals or ditches, and the tide would set according to the course of the canals that received it. Now, as St. George's and the British channels are no more in proportion to the vast ocean, than such canals are to a large navigable river, it plainly follows, that among those obstructions and confinements, the flood may set upon any other point of the compass as well as west, and may make high-water at any other time, as well as when the moon is upon the meridian, and yet no way contradict the general theory of the tide above-asserted.

Of the Construction of MAPS and CHARTES.

AS it is impossible to represent every part of a spherical surface upon a plane, in its due proportion, without distortion or contraction; so every map, on which the superficies of the earth are delineated, will be distorted in some parts, and contracted in others; and though every part, when truly measured, will be found to agree very accurately with the globe; yet the appearance of the whole will be different, the same parts of the earth exhibit a different figure, as different methods of projection are made use of. The two principal methods used in delineating maps are, the Orthographic, and the Stereographic; the former supposes the eye placed at an infinite distance, and the latter in the pole or center of the plane of projection. In order therefore to make an orthographic projection, the following observations must be carefully attended to.

Conceive the eye placed at an infinite distance from the globe; and at the same time, a plane to pass through the center of the globe, and to stand at right angles to the line connecting the centers of the globe and eye; if from the eye thus posited, an infinite right line be imagined to be drawn, through any point of the circumference of any circle described upon the surface of the globe, and the same right line be carried about the circumference of the given circle, till it return to the place from whence it began to move; or which is the same thing, if from any point in the circumference of any circle described upon the surface of the globe, a right line be imagined to fall perpendicular on the given plane, and that this line be carried round the circumference of the given circle, constantly perpendicularly to the plane, and parallel to itself, it will describe on the cutting plane an orthographic representation of that circle; and after the same manner, if rays infinitely long be imagined to flow from the eye to the circumference of every circle described upon the globe, and these rays be carried about the circumference of each respective circle till they return to the place from whence they began to move, they will trace out on the given plane, what is called an orthographic projection of the sphere.

This parallelism and perpendicularity of the generating and describing ray, is the essential and primary property of orthographic projection: and though, according to the Euclidian idea of parallel lines, they can never be conceived to meet if infinitely produced; yet if we consider the infinitely small inclination of the infinitely small portion of the incident rays, intercepted between the surface of the sphere and the plane, the inclination itself vanishes, and the parallel and perpendicular property actually exists.

We shall not dwell any longer on the nature of orthographic projection, as maps are very rarely, if ever, drawn in that manner, its principal use being the astronomical computations, to which it is excellently adapted.

The Stereographic projection is that on which our maps are generally made, and depends upon this principle: That if the plane of any meridian be supposed the plane of projection, then an eye placed in one pole of that meridian will project all the circles in the opposite hemisphere into circular arches on the said plane; and the diameter dividing it into upper and lower hemispheres, is called the line of measures. The map of the world annexed, is projected in this manner; and the eye is supposed to be fixed in the poles, and the equator becomes the line of measures. And hence we see the reason why the meridians and parallels of latitudes lie nearer to each other in the middle part of the map, than at the extremities: consequently the parts of the earth are distorted, and exhibit a different appearance from what they do on the globe. And hence we see the reason why no scale is added to maps of the world, namely, because the miles near the circumference are much longer than those near the center. The construction is performed in this manner. With the chord of 60 degrees describe the primitive circle, whose pole will be the center of the map, and divide it into 360 equal parts, called degrees. Through this center draw the right line oo , which will represent the equator. On each side from the center, set off on the equator as many divisions as are necessary from the semi-tangents, and through these points and the two poles let circles be described, which will represent the meridians. Then set off on the axis or right line go, go , passing through the poles, from the center as before, the same number of divisions as before on the equinoctial; and through these points and divisions on the primitive circle, let circles be drawn, which will represent the parallels of latitude. In the same manner the tropics or polar circles are drawn, the former at 23 deg. 29 min. distant from the equator, and the latter at 66 deg. 31 min. Let both the meridians and parallels of latitude be properly numbered as in the map annexed; and then from a table of the latitude and longitude of places, extract those you intend to insert on your map, and make dots where the meridians and parallels belonging to the latitudes and longitudes of those places intersect each other, which will be their true places on the map.

Besides these different projections, there is another, commonly used in the constructions of sea-charts, called Mercator's projection. We have given a map of the known parts of the world constructed in this manner, which depends on the method of applying the globe of the earth to a plane, which was first accomplished by our countryman Mr. Edward Wright, by the following ingenious conception.

Suppose a rectangular plane was rolled about a globe, till the edges of the plane met, and formed a kind of concave cylinder, inclosing the globe, and touching its equator. Conceive the surface of this globe to swell, like a bladder while it is blowing up, from the equator towards the poles, proportionally in latitude as it does in longitude, until every part of its surface meets that of the con-

cave cylinder, and impresses thereon the lines that are drawn on the globular surface. Then will the cylinder or rectangular plane, on being unrolled, represent a sea-chart, whose parts bear the same proportion to one another, as the correspondent parts do on the globe. But both the meridians and parallels of latitude will be straight lines. Every parallel of latitude will become equal to the equator, and the meridians lengthened as the parallels increase; consequently the distances between the parallels of latitude will be wider and wider as they approach the poles; and these will increase in proportion to the secants of their respective channels.

Hence it appears, that the secantes by the addition of the distances of the parallels from the equator are obtained. And these several distances, which are called meridional parts, being disposed in a table corresponding to the degrees and minutes in a quadrant, from a table of meridional parts; and these set off from the equator, and on the meridian both ways towards the north and south, will give the points through which the parallels of latitude must pass. A view of the map annexed will explain this construction, in which the meridians are at equal distances from each other; but the distances between the parallels of latitude unequal. The great use of this projection is in navigation; because on it the rhumb line, or the tract a ship describes on the surface of the ocean in sailing on a single course, is represented by a straight line, which is not the case in any other projection, where the several degrees of latitude and longitude are represented in a true proportion to each other.

D I R E C T I O N S to the B I N D E R.

The MAPS and PRINTS for the First VOLUME are to be placed in the following Order.

F RONTISPIECE, ——— facing the title	Commemoration of Abraham sacrificing his Son, ———	243
Map of the world, ——— before the introduction	Scene in a Seraglio ———	246
Map of Asia, ——— facing book I. p. 5	A general view of the ruins of Palmyra ———	260
The marriage ceremony of the Japanese, ——— facing page 11	Remains of the temple of the sun in Palmyra, ———	ibid.
The Japanese trampling on the image of our Saviour and the Virgin Mary, ———	Map of Turkey in Asia, ———	265
Map of China, ———	A general view of Balbec, ———	288
Kampfsedale Huts, ———	Map of Africa ———	307
Map of India, ———	Ceremony upon the overflowing of the Nile at Cairo	316
The swing used in India for a diversion, ———	Claas the Hottentot, surrenders himself prisoner to the Dutch ensign, ———	365
The Gentoo Woman burning herself, ———	Attachment of an Hottentot, ———	376
Ordeal, trial of the Gentoos of India, ———	Map of Negroland and Guinea, ———	408
A view of Surat, ———	The king of Jagra summoned before Mumbo Jumbo, ———	448
Map of Persia, ———	Map of Barbary ———	480

The MAPS and PRINTS for the Second VOLUME are to be placed in the following Order.

M AP of Europe, ——— facing page 3	shot the apple from his son's head, ———	302
Turkey in Europe, ———	Map of Italy, ———	330
The lady Mary Wortley Montague visiting the Sultana Hafeten ———	A view of St. Peter's at Rome, ———	389
Ruins of Athens, 3 plates, ———	Mount of Vesuvius, ———	395
Map of Russia, ———	Map of Naples and Sicily, ———	395
Marriage ceremony of the Russians, ———	Procession of the penitent prostitutes at Naples	398
Map of the kingdom of Prussia and Polish Prussia, ———	Map of Spain and Portugal, ———	412
Map of Sweden and Norway, ———	Map of France ———	448
Map of Denmark, ———	Murder of the duke of Burgundy, ———	451
Map of the circle of Austria, ———	View of Paris ———	482

A NEW
S Y S T E M
OF
G E O G R A P H Y.

BOOK I.
Of A S I A in general.

WE shall begin with describing those countries in our hemisphere that are first enlightened by the rising sun, and proceeding with that glorious orb from east to west, shall regularly advance, viewing in progressive order the various regions of the terraqueous globe. It was in Asia that the all-wise Creator is generally supposed to have planted the garden of Paradise, in which he formed the first of the human race. It was there that arts first were known, that edifices were first erected, and cities built. It was Asia that became the nursery of the rising world, after it had been destroyed by the general deluge, and from thence the descendants of Noah founded colonies in all parts of the spacious earth. In Asia the Most High placed his once favourite people the Jews, whom he enlightened by revelations delivered by the prophets, and to whom he gave the oracles of truth. It was in Asia too, that the most glorious instance of the Divine love was accomplished, by the birth, the life, the doctrines, the miracles, the sufferings, and death of the great Messiah. There the first Christian churches were founded, and watered by the blood of the martyrs. There Christianity spread with an amazing rapidity, and, even in the apostolic age, was carried from Judea to India.

These advantages render it highly proper that we should begin with Asia, which is also superior to Europe and Africa in the largeness of its territories, it extending into all climates, from the frozen wilds of Siberia, where the hardy inhabitants, cloathed in furs, are drawn in sledges over the snow, to the sultry regions of India and of Siam, where, seated on the heavy elephant, the people shelter themselves from the scorching sun by the spreading umbrella. In many parts of these vast regions the serenity of the air, the fertility of the soil, the deliciousness of the fruits, the fragrancy and balsamic qualities of the plants, spices, and gums, the beauty and value of the gems, and the fineness of its silks and cottons, gave it such charms, that in the earliest ages, it was the seat of the empires of the Assyrians, Medes, Persians, and Greeks, and its inhabitants were possessed of power, wealth, and opulence; till at length the Mahometans, the enemies of liberty, and of the polite arts, destroyed all its ancient splendor, and rendered the most fertile spots of Asia uncultivated deserts. However, on account of the rich commodities which the southern parts of Asia afford, the people of many distant countries still carry on a considerable trade with each other; and the Indies are resorted to, for the

fake of commerce, by several of the most powerful nations of Europe.

With respect to religion, there are many Jews dispersed through the regions of Asia, and considerable numbers of them were settled in some of the most remote parts of the East Indies, many centuries before the passage to those countries was discovered by the Portuguese. Christianity is far from being established in Asia: there are, however, several sects tolerated in different parts; but its professors generally groan under the yoke of Turkish oppression. The two sects of the religion of Mahomet have over-spread one-third of Asia, and almost all the rest are involved in the grossest idolatry, under different forms; the most considerable of which are the worshippers of Brama and of Foe: besides these there are the more sagacious followers of Confucius, and some of a far more ancient sect, who derive their principles from Zoroaster, acknowledging but one supreme Deity, whom they worship under the symbol of fire, which they esteem the brightest and purest emblem of the all-perfect God.

As to the extent, limits, and boundaries of Asia, that vast continent is situated between 25 and 148 degrees of east longitude from London, and between the equator and 72 degrees north latitude, without including the islands that lie to the south. It is about 4740 miles in length, from the Dardanel on the west, to the eastern shore of Tartary; and about 4380 miles in breadth, from the most southern part of Malacca, to the most northern cape of Nova Zembla. It is bounded by the Frozen Ocean on the north. On the west it is separated from Africa by the Red Sea, and from Europe by the Levant, the Archipelago, the Hellespont, Propontis, Bosphorus, the Black Sea, the river Don, and a line drawn from it to the river Tobol, and from thence to the Oby, which falls into the Frozen Ocean. On the east it is bounded by the Pacific Ocean; and on the south, by the seas that wash the coasts of Japan, China, India, Persia, and Arabia.

This vast extent of territories contains a great number of sovereignties, the most considerable of which are four empires, which, beginning at the east, are those of Japan, China, the empire of the Great Mogul, and Persia; with part of two more, viz. Turkey and Russia, where the most considerable provinces lie in Europe. It has also about thirty-three kingdoms, besides the governments of the Nabobs of India, which may be termed monarchies, as they

are now independent of the Mogul. Of these kingdoms the twenty six following are on the continent, and the other seven in the East Indian islands. Of the former are those of 1. Corea; 2. Samarcand; 3. Beca, in Great Tartary; 4. Kalghar; 5. Great Tibet; 6. Little Tibet; 7. Nanyu; 8. Neckbat; 9. Barantola, or Bassa; 10. Cochinchina; 11. Jaos, in the peninsula on the other side the Ganges; 12. Tonquin; 13. Siam; 14. Aracham; 15. Acham; 16. Cochin, on the peninsula of India on this side the Ganges; 17. Pegu, or Ava; 18. Camboya; 19. Calicut; 20. Bishnagar; 21. Golconda; 22. Vizaper; 23. Mingrelia, and 24. Imeretta in Georgia; 25. Sarta; and 26. Yemen, in Arabia.

The seven insular kingdoms are, 1. Macasser, and 2. Ternate, in the Molucca islands; 3. Borneo; 4. Materan; 5. Achem, in the island of Sumatra; 6. Candy, in the isle of Ceylon; and 7. the Maldivia islands.

To these may be added the dominions established here by the Europeans; namely, the Spaniards in the Philippine islands; 2. the Dutch at Batavia in the isle of Java, the Spice islands, Celebes or Macasser, and on the coast of the isle of Ceylon, &c. 3. the Portuguese in Goa, and other coasts of India. These have all an absolute and supreme authority; and the European governors have, in a great measure, the power of arbitrary princes. To these we shall subjoin, 4. the English settlements at Fort St. George, Bombay, &c. 5. the French at Pondicherry, &c. 6. the Danes at Tranquebar and Danesburg, on the coast of Coromandel, &c.

The languages spoke in Asia are so numerous, that it is impossible to enumerate them. The principal are the Japanese, the Chinese, the Malayan, the Arabic, Persian, Tartarian, Russian, Turkish, the modern Greek, and many others, almost every country and island having a distinct language.

A concise view of Asia, beginning at the east, and proceeding to the west.

I. The empire of Japan.

II. China, which is divided into north and south,

III. India, comprehending

1. The peninsula of India beyond the Ganges; containing Cochinchina, Tonquin, Pegu, and Siam; which latter is subdivided into Martaban, Siam and Malacca.

2. The peninsula on this side the Ganges; containing Decan, Golconda, Bishnagar, and Malabar.

IV. Indostan, or the empire of the Great Mogul, in which are many petty kingdoms.

V. Great Tartary, Siberia, Samojedia, and Asiatic Russia.

VI. Persia.

VII. Turkey in Asia, which is divided into Eastern and Western. The Eastern contains Diarbeck, Turcomania, and Georgia. The Western comprehends Arabia, Palestine Syria, and Anatolia.

VIII. The Asiatic islands are divided into three classes:

1. Those on the Eastern Ocean, viz. the Marian or Ladrone islands, Formosa, and the Philippine islands.

2. Those on the Indian Ocean, which are the Moluccas, viz. Ternate, Tidor, &c. and the Spice islands, namely, Buda, Amboyna, Ceram, Ternate, Timor, Gilola, &c. Celebes, Borneo, Java, Sumatra, Ceylon, the Maldivia islands, &c.

3. On the coasts of Asia, and in the Mediterranean, as Cyprus, Rhodes, Lesbos or Mytelene, Chios or Scio, Samos, Coos, and a few others of less note.

Though the great empire of Japan is composed of several islands, none of which bear the name given by the Europeans to the whole country; yet as it is situated to the east of China, and is too considerable to be confounded with the multitude of islands in the Indies, we shall begin with that empire.

C H A P. I.

Of J A P A N.

S E C T. I.

Of its Situation, Form, and Extent. The Rocks and Whirlpools on its Coasts. Its Volcanoes, Hot-Springs, and frequent Earthquakes.

THE great and wealthy empire of Japan is called by the natives Nippon, which signifies the foundation of the sun, and is thus named from the largest of the islands of which that empire is composed; but by the Chinese it is called Zippon, or Siphon.

The islands of Japan are situated in the Pacific Ocean, to the east of China, and lying between 31 and 42 degrees of north latitude, and between 130 and 147 degrees of east longitude from London; the sun rises there about nine hours before it appears to us.

Nippon, the largest of these islands, extends from south to west, and then turns up to the north; it is about 900 miles in length, and in some parts near 360 in breadth. To this island are added two others, much smaller, and separated from it only by narrow freights. Mr. Kämpfer observes, that the empire of Japan may, in many respects, be compared to the kingdoms of Great Britain and Ireland, being much after the same manner, though in a more eminent degree, divided and broke through by forelands, arms of the sea, great bays, and inlets, running deep into the country, and forming many small islands, peninsulas, gulphs, and harbours. Besides, as the king of Great Britain is sovereign of three kingdoms, England, Scotland, and Ireland; so likewise, he adds, the Japanese emperor hath the supreme jurisdiction of three islands. The first and largest, called Nippon, runs lengthways, from east to west, in the form of a jaw-bone, whose crooked part is turned to the north. A narrow channel, or freight, full of rocks and islands, some inhabited, some uninhabited, parts it

from the second, which is next to it in largeness: and, from its lying to the south-west of Nippon, is called Saikokf, or the Western Country; and is about 592 English miles in circumference. The third island is situated between the first and second, and is nearly of a square figure; and, from its being divided into four provinces, the Japanese call it Sikokf, or the Country of Four. These three large islands are encompassed by an inconceivable number of others, some of which are small, rocky, and barren; others, large, rich, and so fruitful as to be governed by petty princes.

These islands, to which are added two more conquered from the kingdom of Corea, are divided into sixty-eight provinces, and these again into six hundred and four lesser districts. It is proper here to add, that, besides the islands and provinces already mentioned, there are some at a greater distance, which, though they do not properly belong to the empire of Japan, either acknowledge the emperor's supremacy, or live under his protection.

The borders of the empire are secured by its rocky, mountainous coasts, and a tempestuous sea, which, on account of its shallowness, will admit none but small vessels, nor can those approach without imminent danger; for the depth of most of the gulphs and harbours being yet unknown, and others, which the pilots of the country are better acquainted with, being unfit to secure ships of considerable burthen, it seems as if nature designed these islands to be a kind of little world, independent of the rest; especially as they possess whatever is necessary to render the lives of the inhabitants pleasant and delightful, and to enable them to subsist without a commerce with distant nations.

The coasts of Japan are also secured by two remarkable and dangerous whirlpools. The one lying near Simabara, is at high-water even with the surface of the sea; but the tide no sooner begins to ebb, than, after some violent turnings, it is said suddenly to sink to the depth of fifteen fathoms.

fathoms, swallowing up with great force the ships, boats, and whatever, at that fatal juncture, comes within its reach, and dashing them to pieces against the rocks at the bottom, where they sometimes remain under water, and at others are thrown out again at many miles distance. The other, which lies near the coast of the province of Kijnokuni, rushes with a loud boisterous noise about a small rocky island, which, by the violence of the motion, is kept in a perpetual trembling. But though this has a very formidable appearance, it is esteemed less dangerous than the other; for as its noise may be heard at a considerable distance it may be easily avoided.

Water-spouts are also frequently observed to rise in the seas of Japan, and to turn towards the coasts. These the ignorant Japanese fancy are a kind of water-dragons, with a long watery tail, flying up into the air with a swift and violent motion; for which reason they give them the name of spouting dragons.

Japan is very remarkable for the great number of its burning mountains: particularly not far from Firando is a small rocky island, which hath been burning and trembling for many centuries; and in another small island, opposite to Sarzuma, is a volcano that has been burning at different intervals, for many ages. On the summit of a mountain, in the province of Figo, is a large cavern, formerly the mouth of a volcano, but the flame has ceased, probably for want of combustible matter. In the same province, near a religious structure called the Temple of the jealous God of Aso, a perpetual flame issues from the top of a mountain. In the province of Thikufen is another burning mountain, where was formerly a coal-pit; but it being set on fire by the carelessness of the workmen, it has been burning ever since. Sometimes a black smook, accompanied with a very disagreeable stench, is observed to issue out of the top of a famous mountain called Fesi, in the province of Seruga. This mountain is said to be nearly as high as the pike of Teneriff: but in shape and beauty is supposed to have no equal; and its top is covered with perpetual snow. Unsen is a large, though not very high mountain, near Simabara; its top is constantly bare and whitish from the colour of the sulphur, and its smook may be discerned at the distance of several miles. The earth is in several places burning hot, and is so loose and spongy, that, except on a few spots where trees grow, one cannot walk over it, without being in continual fear from the crackling hollow noise perceived under foot. Its sulphureous smell is so strong, that, for the space of many miles round, there is not a bird to be seen; and, when it rains, the water bubbles up, and the whole mountain seems as if it were boiling.

It is worthy of remark, that many cold-springs and hot-baths arise upon and about this mountain; among which there is a famous hot-bath, esteemed an infallible cure for the venereal disease, by the patient's bathing in it for a few moments for several days together. He must begin the cure with another hot-bath, which has a more moderate heat, and is situated at a few leagues distance. As soon as he leaves the bath, the patient must go to bed, and endeavour to sweat; and all the while he uses the waters, he must keep to a hot warming diet. Besides these there are many other hot-baths in different parts of the empire, some of which are said to have extraordinary virtues in curing external and internal diseases.

The very cause which produces so many volcanoes is probably the reason why this country is more subject to earthquakes than perhaps any other in the known world, since both doubtless proceed from the vast quantity of sulphureous and nitrous materials dispersed through the bowels of the earth. Indeed earthquakes are so frequent in Japan, that the natives dread them no more than the Europeans do storms of thunder and lightning. They imagine that earthquakes are caused by a huge whale creeping under ground. Yet sometimes the shocks are so violent, and last so long, that whole cities are destroyed, and many thousands of the inhabitants buried under the ruins. Particularly in the year 1703, an earthquake, attended by a great fire, which broke out at the same time, destroyed almost the whole city of Jedo, together with the king's palace, and 200,000 of the inhabitants. Yet it is observable, that some particular places in Japan are constantly free from this calamity: The Japanese reason variously upon this phæno-

menon; some attributing it to those places being fixed on the immoveable centre of the earth; and others supposing that it is owing to the sanctity of those places, and to the powerful protection of their tutelar gods.

SECT. II.

A general Account of the Climate, Soil, Produce, and Rivers of JAPAN. Of its Minerals and Gems, Trees, Shrubs, Plants, Flowers, and different Kinds of Corn.

JAPAN enjoys a happy and healthful climate, it not being exposed to the burning heat of a more southern sun, nor to the extreme cold and severe frosts of the more northern regions: for it is well known, that in general no countries are so fruitful, and none so pleasant and agreeable, as those which lie in between 30 and 40 degrees of north latitude. The weather is, however, subject to frequent changes; for in the winter they have snow, and pretty hard frosts. On the contrary, the summer, particularly during the Dog-days, is extremely hot; and thunder and lightning frequently happen. Rains fall throughout the whole year; but with the greatest profusion in the months of June and July, which are on that account called Water-months. However, the rainy season is far from coming up to that regularity which is observed in other and hotter parts of the East Indies.

The country is for the most part mountainous, rocky, and naturally barren; but, through the indefatigable care and industry of the inhabitants, they have rendered it so fruitful as to supply them with all manner of necessities, besides the fish which the rivers and the sea afford. Even the most rocky and uncultivated places yield plants, fruits, and roots for the sustenance of the natives, which their indigent ancestors learnt to dress and to prepare, so as not only to render them fit for food, but likewise pleasing and agreeable to the taste. If we consider this and the frugal way of living of the Japanese in general, we need not wonder that this vast and populous empire is so abundantly provided with all the necessities of life, that it can easily subsist of itself, without any assistance from foreign countries, as long as arts and agriculture are followed and improved by the natives. Even this seeming defect of the soil, in requiring the most laborious culture, is an instance of the kindness of heaven, since it keeps up among the inhabitants a commendable spirit of labour and industry. Such in other respects is the fruitfulness of the climate, that there is scarce a hill, though ever so steep, or scarce a mountain, though ever so high, which, on being cultivated, as most are, do not sufficiently reward the industrious labourer for the pains and care he bestows on them. The country being divided and intersected by an almost infinite number of little islands on the coast, and in the channels that separate the three largest islands, is also another instance of the kindness of nature: since the many and different islands are, with regard to the whole empire, what different countries and provinces are with respect to the whole globe: for differing in soil and situation, they produce all the various necessities and luxuries of life; and there is scarce any thing that can be wished for, but what is produced in some province, in some island or other, in such quantities as are sufficient to supply the whole empire. Several provinces produce gold, others silver, others copper, others tin, others lead, and others iron. One of the burning mountains throws out great quantities of sulphur, which is also dug up in many other places; and another produces the white clay of which they make all sorts of porcelain-wares. From others are brought great quantities of timber; and from others pit-coal. Others breed oxen; others horses. One province is remarkably fruitful in rice, another in chestnuts, another in figs, and another in fruit. The coast of one province is famous for its shell-fish, another for its sea-weeds and other sub-marine plants, and the coasts in general afford a plentiful supply of a variety of fish. Pearls are found in the gulph of Omura ambergris upon the coasts of the Riuku islands, and several provinces produce crystals and precious stones. Nor have they occasion to send for medicines from abroad; the many mountains and valleys producing, in the compass of one country, what plants and trees grow in different climates.

The

The country is also plentifully supplied with fresh water, and abounds in springs, lakes, and rivers: some of which are so large and rapid, from their rising on steep high mountains, or from the profuse showers of rain which frequently fall, that no bridges can be built over them, and they cannot be passed without danger. One of the most famous of these is the river Ujin, which is a mile and a half broad; and it having no bridge, it must be forded over. But the force and rapidity with which it falls down from the mountains is so great, that even when the water is so low as to be scarcely knee deep, five strong men, well acquainted with its bed, must be employed to lead a horse over; for, besides its rapidity, the many large stones that lie at the bottom contribute to render the passage equally difficult and dangerous. But the people whose business it is to ford passengers across this, and other rivers, to prevent their not taking due care, are, by the laws of the country, made answerable for their lives.

It has been observed, that gold is found in several provinces. The greatest quantity is melted out of its own ore; but some they wash out of the sands; and a small quantity is also contained in the copper. The emperor claims the supreme jurisdiction, not only of all the gold mines, but of all the mines of the empire, none of which may be worked without a licence obtained from him: for of the produce of all the mines that are worked, he claims two-thirds, and the other third is left to the lord of the province in which the mines lie; but as these lords generally reside upon the spot, they take care to render their share nearly equal to that received by the emperor. The richest gold ore, and that which yields the finest gold, is dug up in one of the northern provinces of the great island Nippon; these mines formerly yielded considerable quantities of that valuable metal; but the veins there, and in most of the other mines, do not yield near the quantity of gold they did formerly. Among the other gold mines there is one in the province of Tsikungo; but it is so full of water, that the people have been obliged to desist from working it. However, it being so situated, that, by cutting the rock and making an opening beneath the mine, the water might be easily drawn off; this was attempted: but there happening to arise, just as they began, such a violent storm of thunder and lightning, that the men were obliged to fly for shelter; these superstitious people imagined, that the tutelary god and protector of the place, unwilling to have the bowels of the earth thus rifled, raised this storm in order to make them sensible how much he was displeased at this undertaking; and therefore no farther attempt was made, for fear of incurring his displeasure.

The silver found here is very fine, and there are mines of it in several places, particularly in the northern provinces.

One of the provinces also affords a small quantity of tin, which is so exceeding fine and white, that it almost comes up to silver: but the Japanese make little use of this metal.

Copper is the most common of all the metals found in Japan. Some of it is the finest and most malleable of any in the world; others are not only exceeding fine, but mixed with a considerable quantity of gold, which the Japanese separate and refine. All this copper is brought to Saccai, one of the five principal cities, where it is refined and cast into small cylinders, about a span and a half long, and a finger thick. There is besides a coarser sort of copper, which is cast into large flat cakes, and sold at a great deal cheaper than the other. Brass is very scarce, and much dearer than copper; lapis calaminaris being imported from Tonquin in flat cakes, and sold at an high price.

Iron ore is dug up only on the confines of three of the provinces; but it is found there in large quantities. The iron is formed into cylinders two spans long, and bought upon the spot by the Japanese merchants, who send it to all parts of the empire. As iron is somewhat dearer than copper, such kinds of household-goods, hooks, cramp-irons in buildings and ships, and such other things as in most countries are made of iron, are in Japan made of copper: they do not however dress their provisions in vessels of that metal, but have a particular sort of light kettles made of a composition of iron.

Coals are dug up in great quantities in most of the northern provinces.

Agates of several sorts, some of which are extraordinary fine, and of a bluish colour, resembling sapphires, and also cornelians and jaspers are brought from a mountain on the northern extremities of the province of Osju.

Pearls, by the Japanese called shell-jewels, are found almost every where about Saikokf in oysters and several other sea-shells. The natives formerly set little value on them, till they learnt that the Chinese were willing to purchase them at an high price. The largest and finest pearls are found in a small sort of oyster, not unlike the Persian pearl-shell; for both valves shut close: they are about an hand broad, exceeding thin and brittle, on the outside black, smooth and shining, and within pretty rough and unequal, of a whitish colour, and glittering like mother of pearl.

Most of their sulphur is brought from a small neighbouring island, which, from the great plenty it affords, is called the Sulphur Island.

Formerly it was thought inaccessible, on account of the thick smoke which was observed continually to arise from it, and from the imaginary spectres by which the people supposed it to be haunted: but, at last, a man of courage and resolution obtaining leave to examine its state and situation, he chose fifty resolute fellows to accompany him, who going on shore, found at the top of an eminence a large flat spot of ground covered with sulphur; and ever since that island brings in to the prince of Satzuma about twenty chests of silver, *per annum*, arising from the sulphur dug up there, besides the profit he makes of the trees and timber that grow along the shore. The country of Simabara, particularly about the hot baths, affords a fine pure native sulphur; but the inhabitants dare not venture to dig it up, for fear of offending the tutelary genius of the place, whom they imagine unwilling to spare it.

Here also is found a naphtha of a reddish colour, which the natives burn in lamps, instead of oil.

Ambergris is found upon the coasts, chiefly in the intestines of a whale which is frequently caught near the shore.

All sorts of submarine plants, shrubs, corallines, corals, stones, mushrooms, sea-fans, algæ, fuci, and the like; as also shells of all kinds, are found in the greatest plenty in the Japanese seas, no ways inferior in beauty to those found about Amboyna and the other Spice Islands: but the natives set so little value on them, that they will not be at the trouble of looking for them.

The varnish-tree is one of the most useful trees of this country; it affording a milky juice which the Japanese make use of in varnishing, or, as we call it, japanning, all their household-goods, dishes, and plates of wood: which are so highly esteemed, both by the prince and peasant, that even at the emperor's table services of lacerated-ware are preferred to those of gold and silver. The true varnish tree is of a kind peculiar to this country, and produces a more beautiful varnish than is any where else to be found.

Though the fruit of both the black and white mulberry-tree is entirely insipid, and not fit to be eaten; yet this defect is fully compensated by the extensive usefulness of its leaves in feeding silk-worms. The mulberry-tree grows in most parts of Japan, but in the greatest plenty in the northern provinces, where many cities and villages almost entirely subsist upon the silk manufactures.

The kashi, or paper-tree, is of the mulberry kind. Though it grows wild in the country, yet, on account of its great usefulness, they transplant and cultivate it in several places. It grows with surprising quickness, and spreads its branches very far. It affords a great quantity of bark, of which they make not only paper, but stuffs, cloth, ropes and several other things. But a farther account will be given of this tree under the manufactures of Japan.

The fansio is a middle sized tree, armed with prickles. Its bark and husks are used instead of pepper and ginger, and the natives eat the leaves on account of their pleasant aromatic taste.

Bay trees of several kinds grow in Japan. That which bears red berries exactly resembles the cinnamon tree, both in its shape, and in the figure and substance of its leaves: its bark has an aromatic taste, but it is much inferior to the agreeable sweetness of the true cinnamon.

The

The camphire-tree also resembles a bay-tree; but bears black and purple berries. The country people prepare the camphire by a single decoction of the roots and wood cut into small pieces. This is extremely cheap, and much inferior to the true Bornean camphire, which is said to be gathered from the stumps of old camphire trees in the island Borneo, upon incisions being made between the wood and bark.

The tea shrub, though one of the most esteemed plants that grow in Japan, is allowed no other room but round the borders of rice and corn-fields, and in barren places unfit for the culture of other things. This shrub grows but slowly, and rises to the height of a fathom, or more; and the rising stem soon spreads into many irregular branches and twigs. The bark is dry, thin, and of a chefnut colour, a little greyish on the stem, and inclined to green on the extremities of the twigs. The branches are irregularly beset with leaves, standing on very small foot-stalks, which would not drop off were they not plucked, the plant being an ever-green. The flowers come forth in autumn, one or two together, not unlike wild roses, an inch or something more in diameter, with very little smell, white, and composed of six round petals, or leaves, standing on foot-stalks half an inch long, which, from a small slender beginning, insensibly grow larger, and end in an uncertain number, commonly five or six small round leaves, which serve instead of the calyx. To the flowers succeed the fruit in great plenty, commonly composed of three round capsulæ of the bigness of wild plums grown together to one common foot-stalk, as to a center, but distinguished by three pretty deep partitions. Each capsula contains a husk, nut, and seed. The husk is green inclining to black, when ripe of a fat, membranous, and somewhat woody substance, gaping on its upper surface, after a year's standing, for the nut, which lies within, to appear. The nut is almost round, and is covered with a thin hardish shining chefnut shell, which, being cracked, discovers a reddish kernel of a firm substance like that of a filbert, at first of a sweetish, and not very agreeable taste, which soon grows rough and bitter. The seeds are not planted in a continued row, which would make them grow up in hedges, but at some distance from each other. Eight or ten of them are generally put into one hole; most of them being naught. As the shrub rises, the careful and industrious once a year fatten the soil about them with human dung mixed with earth, which is neglected by others. They must be at least of three years growth before the leaves are fit to be plucked, and then they bear very good ones in great plenty. In about seven years time the shrub rises to a man's height; but as it then grows but slowly, and bears but a few leaves, it is cut down, and the next year many young twigs and branches grow out of the remaining stem, bearing such plenty of leaves as abundantly repay the loss of cutting it down.

With peaches, apricots, and plums, they are well supplied: and, in particular, they have two sorts of plums different from ours, one purple and the other white, and both granulated like mulberries.

As grapes will not easily ripen, they plant but few vines. Strawberries are there intirely insipid; and both the raspberries and bramble-berries are not very agreeable to the taste. Cherry-trees, and the like, are kept only for the sake of the flowers, as are by some the apricot and plum-trees, which they improve by culture, so that the flowers become as big as roses, and in the spring, when they are in full bloom, afford a delightful sight about their temples, and in their gardens and walks.

Pomecitrons are to be seen only in the gardens of the curious; but there is plenty of different sorts of oranges and lemons. A sort of lemons which resembles the peach, both in shape and size, is esteemed the best; for it has an excellent aromatic flavour. Another sort, that is much scarcer, in shape and size resembles a nutmeg, and is exceeding sour. It grows rather on a shrub than on a tree, and is much used in cookery.

In Japan there are three different sorts of fig-trees: one called kaki, differs from the European fig-tree in several particulars. It grows on a tree that resembles an old apple-tree, the leaves being long, and without notches. The fruit in shape and colour also resembles a reddish apple; but its fleshy part has the taste of a delicate fig; yet the seed is hard, and almost of a stony substance. This tree is no less

admirable for its extraordinary fruitfulness, than for the great use made of the fruit, which, on being dried, affords an agreeable food both for rich and poor. The second sort resembles that which we have in Europe, only it grows on a tree with broad oblong rough leaves, without notches. The third sort, which is very scarce, is the European fig-tree, which was transplanted into the country by the Portuguese.

They have no apple-trees like those of Europe: nor have they any other besides winter-pears, which are very plentiful, and grow to an extraordinary size: but they are not fit to be eaten raw.

Chefnut-trees grow there in great plenty, and the fruit is both larger and better than ours.

Walnut-trees grow chiefly in the northern provinces. The nuts are inclosed in a fleshy pulp, and in size and shape are not unlike to the areka-nut. The kernels, when fresh, are not agreeable to the taste; but when dried, they are more palatable. They have a gentle purging quality, which is owing to their sweet oil, and, on account of their many medicinal virtues, they are served up at table along with the dessert. The oil expressed out of these nuts is very sweet and agreeable, and tastes not unlike the oil of sweet-almonds. It is much esteemed for its medicinal virtues, and is also used in dressing provisions. The smoke of the kernels of these nuts is the chief ingredient of the best Japan-ink. Another sort of nuts, called ginau, is as big as large pistacho-nuts, and grow in great plenty on fine tall trees in almost all parts of Japan. These nuts afford an oil which is much commended for several uses.

Two sorts of oaks grow in the country, both different from ours; and the acorns of the larger sort are boiled and eat by the common people. But firs and cypress-trees are most common in their woods and forests. For the sake of ornament, they are planted in rows along the roads, and over the ridges of the hills and mountains, which renders travelling very pleasant. The natives plant them in sandy and barren places, good for nothing else; and yet, to prevent their becoming scarce, none must be cut down without leave from the magistrate of the place, or without new ones being planted in their room.

The finoki and suggi are two sorts of cypress-trees that yield a beautiful light wood, remarkable for its imbibing no water. The emperor has sometimes forbid the felling of these trees for any use whatsoever: however, little regard is had to orders of this kind, particularly in the remote provinces, unless the transgressor be liable to a severe punishment.

Here is also the iron-tree, so called from the hardness of the wood; and a kind of maple, of which there are two sorts, which differ from each other in this particular, the leaves of one turn purple in the spring, and the other in autumn, and both appear very beautiful. The sali-tree is also said to change the colour of its leaves into a fine purple in autumn.

Japan may vie with most, if not all the countries in the known world, for the great variety of beautiful plants and flowers with which nature has adorned its fields, hills, woods, and forests. Some of these they transplant into gardens, and greatly improve by culture. Among these is the tsbacki, a pretty large shrub that grows in woods and hedges, and has flowers not unlike roses. Of this shrub there are many beautiful varieties. The tsafuki is a shrub with lily-flowers, of which there are many sorts; particularly two kinds that grow wild, one with purple flowers, and the other with those of a fine carnation: these in the proper season, are a great ornament to the hills and fields. The sakanandzio is another shrub with lily-flowers, but much larger than the former. There are likewise numberless varieties of feverfews and lilies growing in the country. The first, being improved by art and culture, are the chief ornaments of houses and gardens; as the other are of desarts and uncultivated places: nor hath nature been less liberal with respect to clove-gilly flowers, narcissuses, and the like. But it is remarkable, that these several flowers fall as short of others of their kind growing in Europe, in strength and agreeableness of smell, as they exceed them in the exquisite beauty of their colours. The same observation holds true with respect to most fruits that grow in Japan, they being far from coming up to the pleasant aromatic taste of those that grow in China, and other countries of the East.

The chief productions of the fields that most contribute to the support of life, are by the Japanese comprehended under the name of the five fruits of the fields. These are, 1. Rice, of which there are several sorts; the best has not its equal in the Indies; it is perfectly white, and extremely nourishing. They boil it to a good consistence, and then eat it at their meals instead of bread; and from this they also brew a strong sort of beer, named *sacki*. 2. Barley, with which they feed their cattle; and also make cakes of it. They have also a sort of barley with purple-coloured ears, which, when ripe, are a great ornament to the fields. 3. Wheat, which is extremely cheap. 4. A sort of beans about the bigness of Turkish peas, and that grow after the manner of lupins. 5. Sobeans, which are black and not unlike lentils; these are ground, and the flour baked with sugar in several kinds of cakes. Under these five classes they comprehend also India corn, millet, and all sorts of peas and pulse.

They have exceeding large turneps, which the natives eat raw, boiled, and pickled: likewise horse-radish, carrots, gourds, melons, cucumbers, and some sorts of lettuces. But, besides all the above plants, there are numberless others that grow in the fields upon hills and mountains, in woods and forests, in barren and uncultivated places, and along the sea-coasts. Of all these there are very few but what afford their roots, leaves, flowers, and fruits, not only for the support of the common people, but even for the luxurious tables of the people of quality. There is a great variety of mushrooms, most of which are eat; and of all the soft submarine plants, there is hardly one but what the natives use for food. The fishermen's wives wash, sort, and sell them; and they are also very dexterous in diving for them, and bringing them up from the bottom of the sea, from twenty to forty fathoms deep.

SECT. III.

Of the Beasts, Birds, Insects, and Reptiles.

CONSIDERING the great extent of the empire of Japan, it is but sparingly supplied with four-footed beasts, either wild or tame. The former find but few desert places where they can increase and multiply, and the latter are only bred up for agriculture and carriage. The doctrine of the transmigration of souls being almost universally received, the natives live chiefly upon vegetables, and know how to improve the land to much better advantage than in turning it into fields for the breeding of cattle.

The horses in this country are small; but some of them not inferior in shape, swiftness, and dexterity, to the Persian breed. They here serve for state, for riding, for carriage, and plowing. Bulls and cows serve only for plowing and carriage. It is surprising that the natives know nothing of milk, butter, and cheese; but probably the cows, as in other eastern countries, yield but little milk. They have a sort of buffaloes of a very large size, that have hunches on their backs like camels, and in large cities serve for carriage and the transporting of goods. They have no elephants, camels, asses, mules, sheep and goats, and but few swine, which were brought over from China, and are bred by the country people in one province, in order to sell them to the Chinese who trade with Japan. Dogs are very numerous, but they have only the common sort, and no greyhounds or spaniels. They have a beautiful kind of cats, which are of a whitish colour, with large yellow and black spots, and a very short tail. They are not fond of mousing, but love to be carried about and caressed, particularly by women.

Of the wild beasts, they have a few monkeys of a docile kind, of a dark-brown colour, with short tails, and with naked faces and backs. They have also a few bears of a small kind in the northern provinces. There are likewise a small number of deer, hares, and wild boars, which some sects are permitted to eat at certain times of the year. Foxes are very common, and the natives imagine that they are animated by an evil spirit: but the fox-hunters are very expert in catching and stripping them of their fur, which is used for their writing and painting pencils. From lions, tigers, leopards, and such other voracious animals, Japan

is entirely free. The *itutz* is a small four-footed animal of a reddish colour. Another larger sort of it is called *tin*. They both live under the roofs of houses. They are very dexterous at catching fowls and fish, and are so tame that they may be ranked in the class of domestic animals. The whole country swarms with rats and mice. Some of the rats are tamed, and taught to perform several tricks. Those which play with most dexterity are to be seen at *Ofacca*, a city to which mountebanks, jugglers, and men with shews resort from all parts.

Of tame-fowl they keep chickens, and sometimes ducks, which are killed and sold by the meanest of the people, to such as will venture to eat them: but in the mourning years for the death of an emperor, and at any other time when the emperor thinks fit to order it, no living creature whatever may be killed or brought to market, in any part of his dominions. The cocks oftener escape than the hens; they being held in great esteem, chiefly among the religious orders, on account of their measuring time, and their being supposed to foretell future changes of the weather. Tho' wild-fowl are naturally shy, yet in this populous country they are so familiar, that many kinds of them may be justly ranked among the tame.

Cranes are the chief of the wild birds of the country, and have this privilege, that it is unlawful to shoot them without an express order from the emperor. They are of two different kinds, one white as snow, the other ash-coloured.

Of herons there are several kinds, which differ in size and colour. The chief are the white and the grey, both very common; and a heron of a bluish colour, almost as big as a crane.

There are two different sorts of wild-geese, which couple only with their kind; the one ash-coloured, and the other as white as snow, with only the extremities of the wings black. Both are very common, particularly the grey ones; and so familiar, that they will not fly away at any body's approach. They do a great deal of mischief in the fields, and yet nobody must kill or even disturb them on pain of death, except those who have bought the privilege of shooting them on some tracts of ground.

There are several sorts of wild-ducks, as tame as the geese. The male of one of these kinds is extremely beautiful; for its feathers are wonderfully diversified with the finest colours imaginable; the neck and breast are red; the head is crowned with a most magnificent topping; besides, the tail rising obliquely, and the wings standing up over the back in a very singular manner, afford a sight as curious as it is uncommon.

There are pheasants of singular beauty; particularly one kind is remarkable for the various colours and lustre of its feathers, and for the beauty of its tail, which is about a yard long, and in the variety and mixture of the finest colours, chiefly blue, is not inferior to that of the peacock.

Woodcocks are very common, and are eat by some sects, as are also the wild-geese, ducks, and pheasants.

Storks stay in the country all the year. Hawks are as common here as in other parts of the East Indies. The best falcons are caught in the northern provinces.

The *misago*, or *bisago*, is a voracious bird of the hawk-kind, which preys chiefly on fish. It makes a hole in some rock upon the coasts, where it lays up the prey it has caught, which is observed to keep as well as pickled fish. It tastes very salt, and is sold dear. Whoever has discovered such a cave may make a good deal of money of it, provided he does not take out too much at a time.

The *foken* is a scarce night-bird, of a most delicious taste; and therefore affords a dish for the tables of people of quality.

Larks sing much better here than in Europe; and night-ingales, if they have a good voice, are sometimes sold to curious people at a very high price. In short, snipes, sea-pies, news, sea-ravens, swallows, and sparrows, are as common here as in Europe.

Here are bees, and consequently some honey and wax, though but in a small quantity: also humble bees, wasps, gnats, flies, locusts, beetles, and a great variety of other insects common in Europe; besides some other remarkable sorts, the chief of which we shall here mention. Among the butterflies there is a large sort called the mountain-butterfly, which is either entirely black, or curiously diversified

Ceremony of Marriage of the Japanese.

fished with white, black, and other spots. The komuri is a beautiful, large, spotted, and hairy night fly.

They have also several very extraordinary kinds of beetles, among which is a brown one called sebi, that must appear very curious to the attentive eye of the naturalist. They are of three kinds, and the largest resemble in shape the flies which in Europe fly about in the evening; but they have no wings. They lie in the ground all the winter, and creeping out in spring, in the night-time, fasten themselves to the trees, or whatever in their march they can lay hold of. A little while after they burst, and their back splitting lengthwise, makes way for the deliverance of a fly, like a beetle, that was inclosed within it, and which instantly appears much bigger than the prison in which it was confined; when bursting forth, it spreads its four wings, and flies away, singing with a loud voice, which, it is said, may be heard at the distance of an English mile. The woods and mountains are filled with the noise; but they gradually disappear in the dog-days, when they are said to creep into the ground again, in order to undergo a new metamorphosis, and that they may re-appear in the same state the following year. Another smaller kind is seen later in the year, about the time when the others disappear. They sing from noon to sun-set; but their music is not near so loud as that of the others, and they continue abroad till late in autumn. The third sort differs from the second only in singing from morning till night. The females of all the three kinds are mute.

They have cantharides of several beautiful kinds; but their use is unknown. The finest of all the flying tribe of insects is a scarce night fly, which, on account of its incomparable beauty; is kept by the ladies among their curiosities. It is of about the length of a finger, slender, round-bodied, and with four wings; two of which are transparent and hid under a pair of others, which shine with the finest polish, and are most curiously adorned with lines and spots of blue and gold.

Among the insects are small mischievous creatures, called white ants. These live together in community like the European ants, and nearly resemble them in shape and size. The Japanese call them piercers, an epithet which they well deserve, for they pierce whatever they meet with, stones and ores excepted; and when once they get into a ware-house, they are able, in a short time, to destroy all the goods. Nothing has been as yet discovered that will keep them off, but salt laid under the goods and spread about them.

The lizards of this country resemble those of Europe. There are but few snakes. One of the most famous is of a green colour, with a flat head and sharp teeth. Its bite is followed by a speedy death; yet the soldiers are very fond of its flesh, from their firmly believing that their eating it makes them bold and courageous. Another sort of snakes is of a monstrous size. These are found in waters and upon mountains; they are very scarce, and when taken are shewn for money.

S E C T. IV.

Of the Persons of the Natives; their Dress at home and when they travel. Their Marriages, Funerals, Character, Temper, and Disposition. Their Skill in Agriculture, Arts, and Manufactures. More particularly the Manner in which they make Paper of the Bark of the Paper-tree; their Method of making Salt; the Preparation of Tea, and the Manner in which they drink it.

WE shall now proceed to the rational inhabitants of Japan, and consider their persons, their dresses, their origin, religion, and manners.

The difference observable between the inhabitants of several provinces in their shape and features is as great as if the country had been peopled at different times, and from different nations. The Japanese in general, particularly the inhabitants of Nippon, seem very disagreeable: they are short sized, tawney, with flattish noses, thick eye-lids, and are strong and thick-legged: but the descendants of the eldest and noblest families are more like the Europeans, and have something more majestic in their shape and countenances. The natives of the provinces of Satzuma and

Fiuga are of a middle size, strong, brave and manly, civil and polite. This is also observable in some of the northern provinces in the great island Nippon; but those of the eastern provinces of that island are distinguished by their big heads, flat noses, and muscular fleshy features. Yet the natives of some of the provinces of the island of Saikok, though short, are slender, well shaped, of a handsome appearance, and are extremely polite.

The dress of the Japanese is of silk or cotton, and consists of a short vest next the skin, a long gown over it, and, which is pretty singular, a cloak or mantle within doors, which they pull off when they go abroad. Notwithstanding their being shaved, one lock alone being left on the crown of the head; they commonly go bare-headed: but when they walk abroad generally make use of an umbrella, which those in genteel circumstances have carried over their heads by a servant. Both the rich and poor wear a sword by their side, or at least a dagger, and a fan in their hand. But the nobility and the soldiers have the privilege of wearing two swords. The distinction of dress, according to rank, chiefly consists in the richness and colour of the stuff; but, contrary to the custom of most nations, they use black at their festivals, and white for mourning. The same singularity appears in some other of their customs.

As the Japanese make a different appearance on horseback, and the dress used at home does not resemble that worn by travellers, we shall now describe the latter. To keep off the heat of the sun, travellers, instead of an umbrella, wear a large hat, neatly made of split bamboos, or straw, and tied under the chin with broad silk bands lined with cotton. It is transparent and exceeding light; and yet, if once wet, will let no rain come through. This hat is not only worn by men on their journeys, but by women in cities and villages at all times and in all weathers. A traveller must also provide himself with a long cloak against rainy weather, made of double varnished oil paper, and so very large and wide, as to cover not only the man and his baggage, but the back and sides of the horse. They also wear very wide drawers, which cover their legs, and are slit on both sides to put in the ends of their long gowns, which would otherwise be troublesome to them in riding or walking. Some wear a short cloak over the drawers; and some, instead of stockings, wrap a broad ribbon about their legs. Ordinary servants wear no breeches, and, for expedition sake, tuck their gowns quite up to their belts, exposing their backsides and privy-parts, which they say they have not the least reason to be ashamed of. As both sexes never go abroad without fans, in their journeys they commonly make use of those which have the roads printed upon them, and tell them how many miles they are to travel, what inns they are to go to, and what is the price of provisions. Some, instead of such a fan, make use of a road-book. These are offered to sale by numbers of poor children begging along the roads. A Japanese tucked up after this fashion makes a very odd figure; for besides their being generally short and thick, their large hat, wide breeches and cloak, together with their sitting cross-legg'd on the horse, make them appear broader than they are long. As to the bridle, the traveller hath nothing to do with that, the horse being led by one of his footmen, who walks on the horse's right-side, near the head, and, both he and his companions, sing merry songs to divert themselves and animate the horses. This custom is universal; for none guide their horses themselves. The great men are carried by their servants in a kind of sedans, though the journey be ever so long.

Their marriages are celebrated before some of the bonzes, or priests, at the foot of an idol; where the bridegroom and bride have two tapers, or lamps, put into their hands, while the priest pronounces the words, after which the bride throws the toys she had played with in her childhood into the fire; and, in their stead, receives from the relations presents suitable to her present condition, together with their congratulations and good-wishes. At length, after some offerings made to the idol, the whole company, attended with vocal and instrumental music, are conducted to the bridegroom's house, where the feast lasts a week; during which the music, dancing, banquets, and strong liquors, are seldom spared.

The noble and the wealthy strive to honour the dead with great pomp and ceremony; and drinking at the funeral feast

feast is rendered in some measure expedient, in order to dispel the gloominess excited by the funeral, and by the mournful songs, speeches, and gestures of the priests; and more especially by the superstitious charms, passes, bills of exchange, and other knavish impositions, by which they pretend to keep back or disperse those malicious spirits which the credulous laity suppose lie in wait for departed souls, and to procure them a comfortable place in the other world.

Notwithstanding the extreme superstition of the Japanese, which appears on every occasion, their behaviour, from the meanest countryman up to the greatest lord, is such, that the whole empire may be termed a school of civility and good manners. They have such an innate curiosity, that were they not absolutely denied a free and open conversation and correspondence with foreigners, they would receive them with the utmost kindness and pleasure. But both their love and hatred, their esteem and contempt, are handed down to the latest posterity; for wrongs and injuries are resented by succeeding generations, and mutual enmities seldom cease, but with the death and total destruction of one of the parties. But, notwithstanding this vindictive spirit, they do not in other respects want generosity and humanity: nor are they at all deficient in personal bravery. Such is the education of their children, that ideas of courage and resolution seem the first and chief impression they endeavour to make upon their tender minds. In the very first stage of infancy, when they cry, warlike songs are made use of to appease them. The boys when they learn to read, have scarce any other books but the histories of their heroes; and grown persons, when in company, turn the conversation chiefly upon the heroic exploits of their forefathers, calling to mind the minutest circumstances recorded in their histories. Hence when fires are lighted at night, according to the custom of the country, on the tops of the mountains, which is seldom done but upon some imminent danger, when the princes are to send their quotas of troops, the people crowd to be enrolled, carrying their arms along with them; and, in time of battle, are so inflamed with martial ardour, that they are impatient of exposing themselves by rushing into places of the greatest danger; nor do they want proper arms, for at a distance they fight with guns and arrows, and when they get hand to hand they make use of pikes, and of sabres so sharp and well tempered, that they will cut a man in two at the middle.

The Japanese are industrious, and enured to hardships. They are satisfied with little, and the generality live on plants and roots, turtle, shell-fish, sea-weeds, and the like. Water is their common drink, and, as hath been already intimated, they go bare-headed and bare-legged. They wear no shirts, and sleeping on a mat, instead of a pillow, lay their heads on a piece of wood somewhat depressed in the middle: yet they are very nice in keeping themselves, their cloaths, and houses, neat and clean.

The Japanese are probably an original nation, no ways indebted to their neighbours, the Chinese, for their descent; and though they have received from them several useful arts and sciences, as the Romans did from the Greeks, yet it appears from their histories, that they were never conquered, either by them or by any other nation. While the Chinese are justly considered as a crafty, cunning, covetous, and knavish people, the Japanese are admired for their strict honesty, faithfulness, and generosity; and no people are more careful to breed up their children to a love of these and every other virtue. For this purpose they have a prodigious number of academies, the principal of which is Frenajam, or Frenoxama, about nine or ten miles from Miaco.

The Japanese language, which has scarcely any affinity to the Chinese, is very grammatical and copious, abounding in synonymas. They in general write like the Chinese, from top to bottom, but have different hands, none of which resemble the Chinese characters. Indeed several professions have their peculiar ways of writing, among which one runs from right to left, and back again from left to right.

The Japanese are perhaps as good husbandmen as any people upon earth, and, indeed, it is not surprising that they have made great improvements in agriculture, considering not only the extreme populousness of the country, but that the natives are denied almost all commerce and communication with foreigners, and are obliged to support themselves by their own labour and industry. Hence not

only the fields and flat country, which are seldom turned into pasture-ground, but the hills and mountains, afford corn, rice, pulse, and numberless edible plants. Every inch of ground is improved to the best advantage, and none can behold, without admiration, the hills and mountains, many inaccessible to cattle, and that in other countries would lie wholly neglected, cultivated up to their very tops. They are skilful in manuring their ground, which they do in various ways, and with many different substances. Flat low lands are plowed with oxen, steep and high ones by men, and both manured with human dung. As to rice, which is the principal food of the natives, such grounds as are proper for it are turned into rice fields; particularly the low flat lands, where they have a command of water, and can cut canals. All lands are surveyed every year before they are sown, by sworn surveyors, who are proud of their skill in geometry, and, as well as the nobles and soldiers, have the privilege of wearing two swords. At the approach of harvest they are surveyed again, when it is computed what the whole crop will amount to, which is generally done by guess with a surprising accuracy: but if the harvest is likely to prove extraordinary good, they cause the corn upon a square piece of ground to be cut and threshed, and thence compute the produce of the whole. This is done for the security of the landlords, who have six parts in ten of all the produce of their lands; and the tenant, for his trouble and maintenance, the other four. Such as hold lands of the crown, give only four parts in ten to the emperor's steward. But, for the encouragement of such as cultivate untilled ground, they have the whole crop for the first two or three years. Among many extraordinary laws in relation to agriculture they have one, by virtue of which whoever does not cultivate his ground for the term of one year, forfeits his title and possessions.

As to curious and useful mechanical arts, they want neither proper materials, nor industry and application; and are so far from having any occasion to send abroad for masters, that they exceed all the other eastern nations in ingenuity and neatness of workmanship, particularly in gold, silver, brass, and copper. Their skill in tempering of iron is evident from the goodness and neatness of their arms, their sabres being said to exceed those of all other countries. No nation in the East is so dexterous in carving, engraving, and gilding of what they call *sowaas*, a particular kind of metal, made of a mixture of copper with a little gold. They weave silk stuffs so fine, neat, and even, that they are inimitable even to the Chinese. This is the usual amusement of the great men of the emperor's court, when in disgrace or banished to certain islands, where they have nothing else to do, but to exercise their ingenuity in this or the like curious manufactures. Their porcelain, both in the excellence and whiteness of the earth, and in the beauty of the colours and painting, greatly exceed any made in China. The same may be said of their varnished or japanned household-goods, which are surprisingly fine, and the varnish harder and more durable than that of any other country. They have also the admirable art of printing, which they probably learnt from the Chinese.

Their beer, which they call *saki*, and which is brewed from rice, is much better and stronger than that of the Chinese; whom they also exceed in dressing of their provisions, which they generally season with spices of their own growth. Their paper too, which they make of the bark of the paper-tree, is stronger, of a better body, and whiter than that made by the Chinese. The manner in which this is performed deserves a particular description.

Every year when the leaves of the paper-tree fall off, the young shoots are cut into sticks about three feet long, and being tied up in bundles, are boiled with water till the bark shrinks from the wood. The sticks are then exposed to the air till they grow cold, and being slit open lengthways, the bark is taken off, dried, and carefully preserved. Afterwards being soaked in water till it is soft, it is scraped, and the stronger bark, which is full a year's growth, is separated from the thinner, which covered the younger branches; the former yielding the best and whitest paper. The bark, being then cleansed from all knots and impurities, is boiled in clear lye, and constantly stirred about till it is grown so tender, that on being slightly touched, it will separate into small fibres. The bark thus softened is washed in a river in sieves, and constantly stirred about with the hands,

hands, till it is diluted into a soft delicate woolly substance, and then put upon a thick, smooth, wooden table to be beat with sticks till it resembles the pulp of soaked paper. The bark thus prepared is put into a narrow tub, with the slimy infusion of rice, and the infusion of the orei root, which is also slimy and mucous; and being mixed into an uniform liquid substance by stirring it with a thin reed, the sheets are formed one by one, by taking up this liquid substance in a proper mould made of bulrushes instead of wire, carefully laid one upon another on a table covered with a double mat, while a small piece of reed is put between every sheet; which standing out a little, serves in time to lift them up conveniently, and take them off singly. Every heap is covered with a small board of the same shape and size with the paper, on which are laid weights, which are at first small ones, lest the sheets, which are as yet wet and tender, should be pressed together into one lump; but by degrees more and heavier, to squeeze out the water. The next day the weights are taken off, and the sheets lifted up one by one, and with the palm of the hand clapt to long planks and exposed to the sun: and when fully dry, taken off, laid up in heaps, pared round, and then kept for use or sale.

In the province of Fisen is made the Japanese porcelain, or china ware, of a whitish fat clay, which is found there in great plenty. Though this clay be of itself good and clean, it requires a great deal of kneading and washing before it is brought to the proper degree of perfection; which is attended with such labour, as to give birth to the old hyperbolical expression, *That human bones are an ingredient in china-ware.*

In several maritime provinces salt is thus made: they close in a spot of ground, and filling it with fine loose sand, pour sea-water upon it and let it dry. This being repeated several times, they take out the sand, and put it into a large trough with small holes at the bottom; and putting sea-water again upon it, let it filtrate through the sand, and then boil it to a good consistence. The salt thus obtained is calcined in earthen pots till it becomes white and fit for use.

We have already given a particular account of the cultivation of the tea-shrub in Sect. II. but as tea makes so considerable an article in European luxury, we cannot here forbear describing the manner in which the Japanese gather and prepare it for use. Those who have a great number of shrubs hire day-labourers, who make it their particular business; and are very dexterous in gathering the leaves, which must be plucked one by one. Those who gather them thrice a year, begin their first gathering at the latter end of February, or the beginning of March, when the shrub has but few leaves, which are very young and tender, and not fully opened; these are reckoned the best, and are called imperial tea, and by some the flower of tea. The second gathering is in the latter end of March, or the beginning of April, when care is taken to sort them into classes; according to their size and goodness; those that are not fully grown coming nearest to those of the first gathering. The third gathering is made when the leaves are come to their full growth. Some neglect the two former gatherings, and confine themselves to this, in which the leaves are again sorted into different classes, the third of which contains the coarsest leaves, that are full two months grown; and is the tea commonly drank by the vulgar.

The climate of Udsi, a town and district near the city of Miaco, has been observed to be singularly favourable for the culture of tea; and hence all that is drank at the emperor's court, and in the imperial family, is cultivated on a mountain in the same district. The chief purveyor of tea at the imperial court, who has the inspection of this mountain, sends his deputies to cultivate the shrub, and gather and prepare the leaves. The mountain is pleasant, and surrounded with a broad ditch to keep off man and beast. The shrubs are there planted in walks, which are swept every day, and care must be taken that no dust falls on the leaves. Two or three weeks before the time of gathering, the men must abstain from the eating of fish, or any unclean food, lest the leaves should be injured by the impurity of their breath. During the time of gathering they must bathe two or three times a day, nor must they touch the leaves without gloves. The finest imperial tea, being thus gathered and prepared according to art, are put into paper-

bags, and these into large porcelain vessels, which, for the preservation of the leaves, are filled up with common tea. The chief surveyor of the works then sends them up to court with a strong guard, and a numerous attendance. Hence arises the great price of this imperial tea; for the chief purveyor of tea, in the accounts he lays before the imperial exchequer, is not ashamed to bring in the price of some of this tea at one obani a pound: the obani being a gold coin worth an hundred ounces of silver. And Mr. Kämpfer observes, that when he had an audience at court, one of the gentlemen in waiting presented him a dish with the following compliment: "Drink heartily, and with pleasure, for one dish costs an itzebo;" that is, about twelve or thirteen shillings English.

The Japanese use the following method in preparing the leaves: when fresh gathered, they are dried or roasted over the fire in an iron pan, and when hot rolled with the palm of the hand on a mat, till they become curled. This is repeated several times, at each of which the heat of the fire is decreased. For this purpose they are carried to public roasting-houses as soon as they are gathered; for if they were kept but one night, they would turn black, and lose much of their virtue. In these roasting-houses are several ovens, each three feet high, with a wide flat square or round iron pan at the top. The side just over the mouth of the oven is bent upwards for the roaster, who stands on the opposite side, to secure him from the fire, that he may be able constantly to turn the roasting leaves. They have also several long tables covered with fine mats, on which the leaves are rolled. The tea, after its being thus roasted and curled, is no sooner cold, than it is put into earthen-jars with narrow mouths, which are stopped up to preserve it from the air.

The Japanese manner of drinking tea is very different from that of the Chinese and Europeans. Before the leaves are used, they are reduced into a very fine powder by grinding them in a hand-mill, made of a black greenish stone; after which it is served up in company in the following manner: the powder is inclosed in a box, and the rest of the tea-table furniture is brought into the room where the company sits. All the cups are filled with water, and the chest being opened, they take out with a small neat spoon about as much of the powder as will lie on the point of a pretty large knife, and put it into every dish. They then mix it with a curious denticulated instrument till it foams; and so present it to be sipped while hot.

There is another method of making tea, used by the vulgar and the country people, who use it as their common drink. Before sun rise one of the domestics hangs a kettle of water over the fire, and puts in; either when the water is cold, or after it has been made hot, two, three, or more handfuls of the coarsest kind of leaves, according to the number of the heads of the family, and at the same time puts in a basket of a size and shape that exactly fits the inside of the kettle, to keep the leaves down to the bottom, that they may be no hindrance in lading out the water. This is to quench the thirst of the whole family all day, and therefore a basin of cold water is put by it, that in case they should not have time to sip it leisurely, they may cool it as they please, and drink large draughts.

As there are people in Europe who teach to carve, to fence, to dance, &c. so there are masters in Japan who teach children of both sexes to do the honours of the tea-table, and to behave well in the company of those who drink tea.

We shall now endeavour at least, to give the reader some idea of the ships, boats, and different kinds of buildings erected by the Japanese.

SECT. V.

Of their Ships, Boats, and Houses. The Emperor's Palace at Jedo described. The Populousness of the Country. A Description of Jedo, and of the Cities of Miaco and Osacca.

THE merchant-ships, which serve for transporting men and goods from one island or province to another, are the largest naval buildings of this country. They are commonly fourteen fathoms long, and four broad; built for rowing as well as sailing: they run tapering from the middle

middle towards the stem, and both ends of the keel rise high above the water. The stem is broad and flat, with a wide opening in the middle, which reaches down almost to the bottom of the ship, and lays open the inside to the eye: for, by the emperor's order, no ship is to be built without such an opening, in order to prevent his subjects from attempting to venture out to sea, on any voyage whatever. The deck consists only of deal-boards laid loose, and, when the ship is fully laden, rises but little above the surface of the water. It is almost covered with a sort of cabin, which projects out of the ship about two feet on each side, and round it are folding windows, that may be opened or shut at pleasure. Here small rooms for passengers are separated from each other by folding-screens and doors, and the floor covered with mats. The roof or upper-deck is flat, and made of neat boards curiously joined together; and, in rainy weather, the mast is let down upon it, with the sail extended over it for the sailors and the people employed in the service of the ship to sleep in the night. Sometimes, the better to defend the upper-deck, it is covered with straw-mats. The ship has but one mast, which is of the same length with the vessel, and is wound up by pulleys. But though the anchors are of iron, the cables are only of twisted straw. The largest of these ships have commonly thirty or forty hands to row them, which they do when the wind fails. These rowers are seated on benches towards the stern, and row according to the air of a song, which serves at the same time to regulate their motions, and animate them at their work. The timbers and boards are fastened together with hooks and bands of copper, and the stern is adorned with black fringe. Men of quality, when they undertake one of these small voyages, have their cabin hung with cloth, on which is sewed their coat of arms. Their pike of state, the badge of their authority, is put on the stern by the rudder, and on the other side is a weather-flag for the use of the pilot. Small ships no sooner come to an anchor, than the rudder is wound up and one end put ashore; so that any one may pass through the opening of the stern as through a back-door, and walk to land over the rudder, as over a bridge.

Both their ships and boats are built of cedar or fir, which grow in great plenty in the country. The latter are of a different structure, according to the purposes and the waters for which they are built. The pleasure-boats, which are only used in the rivers, or in crossing small bays, are also widely different in their structure, according to the fancy of their owner. As they are commonly built for rowing, the first and lowermost deck is low, and upon it stands another more lofty with open windows; and this may be divided at pleasure into several small rooms. The roof and several parts of the boat are adorned with a variety of flags and other ornaments.

As both these ships and pleasure-boats must appear very trifling and puerile works, when compared with our ships, and the galleys used in many parts of Europe, so all the buildings in the country, whether ecclesiastical or civil, public or private, though richly decorated, are destitute of that simple grandeur observed in ours. By the laws of the empire, the houses of private persons are not to exceed six fathoms in height, and they are seldom built so high, except they are designed for ware-houses; and though there are many common houses of two stories, the upper story is only fit for a lumber-room. The reason of their building their houses so very low, is the frequency of earthquakes, which prove most fatal to lofty edifices. The houses of the Japanese are however to be admired for their cleanliness, neatness, and curious furniture. They have none or but few partition-walls; but, instead of them, make use of folding-screens, made of coloured or gilt paper, fastened on wooden frames, by which means they enlarge their rooms and make them narrower, as best suits their fancy or convenience. The floors are raised above the level of the street, and are all made of boards neatly covered with fine mats, the borders of which are fringed, embroidered, or otherwise neatly adorned; and upon these mats they sit cross-legged. In all the lower part of the house the doors, windows, posts, and passages, are painted and varnished; and the ceilings covered with gilt or silvered paper, embellished with flowers, and the screens in several rooms curiously painted. In short, there is not a corner in the

whole house but has a pretty appearance. In the noble-men's houses there are two distinct sets of rooms, and in that which is farthest from the entrance the women live; while the other is occupied by the men. These houses have commonly a spacious court, with an ascent to the house; and also a descent on the back of it of three or four steps, leading into a garden, adorned with walks, terraces, mounts, flowers, and other embellishments; which yield a beautiful prospect, even from the first entrance; and there is always an open passage through the house. The apartments of the most wealthy people are furnished rather in a neat than expensive manner. If they appear extravagant in any thing, it is in the ceilings of their halls and summer-houses, which are of fine cedar, plated with gold and silver of curious workmanship, and embellished with a great variety of other ornaments. But as the houses in general are low wooden structures, in which they make up in length and depth what they want in height, this renders their cities very subject to fire, which frequently causes great devastations; however, to preserve themselves and their most valuable effects on these dreadful occasions, they have an apartment all of stone separate from the rest of the building, to which they fly with their richest goods, whenever threatened by such disasters.

The imperial palace at Jedo, the metropolis of the empire, which in 1703 was destroyed by an earthquake, has been since rebuilt with surprising magnificence. It is on all sides fortified by three lofty walls and as many deep ditches, with large plains between them; the water being conveyed from one ditch to another by subterranean pipes. These walls have eight or nine gates, which are placed in such a manner, that one must turn to the right and left before one enters the inner court. Besides, between every two gates there is first a large plain; then an ascent by a flight of steps to out-works, surrounded by high walls, with void spaces large enough for a thousand men to be ranged in order of battle. In the center of all are the imperial apartments, consisting of three rows of buildings in front, each nine stories high, and formed on the top like pyramids, with large dolphins over them plated with gold. These structures contain a great number of spacious halls, lodging rooms, and offices for the emperor, his wives, and attendants, all of them magnificently furnished; and behind are parks and gardens, in which are groves, terraces, canals, fish ponds, and water-works. The ceilings of the halls and lodgings are plated with gold and silver, curiously raised, and enriched with a variety of precious stones; and these rooms are hung with the richest silks flowered with silver, gold, and pearls. The hall where the emperor receives homage, has a throne of massy gold, enriched with precious stones of incredible size and inestimable value. The roof, which is all plated with gold, richly enamelled with figures and landscapes, is supported by large and lofty pillars, finely gilt. In the area before the palace is a stately theatre, in which plays are acted, for the diversion of the imperial family. In the next circuit without are the palaces of the emperor's relations and chief counsellors; and in the outermost are those of the kings and princes, who are the governors of provinces, placed according to their rank. Every palace of the whole structure is covered with gold. The ornaments and furniture within the apartments of the princes and nobles, who are obliged to reside there six months in the year, are no less beautiful; it being esteemed a singular mark of respect to the emperor for them to strive to exceed each other both in the richness and splendor of their palaces and their furniture, as well as in the multitude and grandeur of their retinue: whence the palace, which is about five miles in circuit, appears like a populous and opulent city inhabited by kings and nobles; among whom the children of all the princes, who are here educated and kept as pledges of their father's loyalty, make no inconsiderable appearance, as they are richly dressed, and adorned with all the ornaments that are most beautiful and costly. The emperor is said to spend no less than twenty-five millions sterling in his pensions and the expences of his table. Besides this, he has a number of other palaces in different parts of the country. We shall omit any description of their temples till we come to treat of their religion.

The

The populousness of Japan exceeds all imagination; for the several productions of art, whether absolutely necessary for the support of life, or serving only the purposes of luxury and magnificence being not performed with equal skill in all the provinces of the empire, nor every where to be purchased at the same price; an incredible trade and commerce is carried on between the several parts of the emperor's dominions. How busy and industrious, says Mr. Kæmpfer, are the merchants! how full are the ports of ships! how many rich and trading towns are scattered through the country! Along the coasts, and near the sea-ports, there are such multitudes of people, such numbers of ships and boats both for use and pleasure, that our author says, one would be apt to imagine that the whole nation had settled there, and that all the inland parts of the country were left quite desert and empty. Yet it is scarce credible what numbers daily travel through the roads of this country, some of which are on particular days more crowded than the streets of the most populous towns in Europe; which is partly owing to the frequent journeys which the natives undertake, oftener perhaps than any other nation; and to the princes and lords, with their numerous retinues, going to or returning from court.

Most of the towns are very populous and well built, and the streets are generally regular, running in straight lines, and crossing each other at right angles. The towns are neither surrounded with walls nor ditches: but there are two chief gates where the people enter the town from the road. These, however, are generally no better than the ordinary gates that stand at the end of every street; and are shut up at night: but, in large towns, where some prince resides, these gates are a little handomer, and a strong guard is commonly mounted there out of respect to the residing prince. The rest of the town commonly lies open to the fields, and is but seldom inclosed even with a common hedge and ditch. Having given this account of the towns in general, we shall add a more particular description of two or three of the principal cities.

Jedo, the metropolis of the whole empire of Japan, is situated in 35 degrees 54 minutes north latitude, and in 144 degrees 5 minutes east longitude, in a spacious plain, at the head of a bay, famed for its great plenty of fish, particularly lobsters, crabs, and oysters: but the water is so shallow, as to permit no ships of bulk to come up to the city; and therefore they are obliged to unload them about a league below it. It is said to be 21 miles in length, 15 in breadth, and near 60 in circumference, extending along the bay in the form of a crescent. Though it is not surrounded with walls, it is in several places intersected by ditches and high ramparts planted with trees, not so much for defence and ornament, as to prevent the spreading of those conflagrations by which it frequently suffers. A large river runs through it, and, before it enters the bay, divides into several branches, over each of which is a handsome bridge, the finest and largest of which is stiled, by way of eminence, The bridge of Nippon; and from it is computed the distance of places throughout the whole empire. The houses, like those in all other parts of Japan, are low and built of fir, covered on the outside with a whitish clay; but they are very neat within. Almost every house has a place under the roof, or upon it, where they constantly keep a trough of water and a couple of mops; by which precaution fires, when first broke out, are often extinguished: but this expedient is far from being sufficient to stop the fury of the raging flames, when they have already gained ground; and against this they have no better remedy than to pull down some of the neighbouring houses. The city is well stocked with temples, monasteries, and other religious structures. There are also many handsome edifices in it belonging to persons of distinguished rank; these have large court-yards before them, and stately gates; fine varnished stair-cases, consisting only of a few steps, leading up to the door of the house; and the inside is divided into several magnificent apartments, all of one floor. The city of Jedo is a nursery of merchants, tradesmen, and artists; and yet every thing is sold dearer there than in any other part of the empire, on account of the great concourse of people, the number of courtiers, and of the religious, who lead an idle monastic life, and from the difficulties of furnishing a sufficient supply of provisions.

Kio, or Miaco, was anciently the capital of the empire, and is the residence of the dairi, or ecclesiastical hereditary emperor. It is situated in a large plain in the province of Jamatto, in the most southern part of the island of Nippon, and is upwards of three miles long and a mile broad. It is surrounded with pleasant green hills and mountains, in which rise a number of springs and small rivers. The city approaches nearest to the mountains on the east side, where abundance of temples, chapels, and religious houses stand on the ascent. Three shallow rivers enter the city on that side, and are all united into one in the middle of Miaco, where there is a bridge 200 paces in length. The dairi, with his family and court, resides in the north side of the city, in a particular ward, consisting of twelve or thirteen streets, separated from the rest by walls and ditches. On the west side of the town is a strong castle built of free-stone, in which the emperor resides when he comes to pay a visit to the dairi. This structure is 150 paces long, and is inclosed by a wall, and a deep ditch filled with water. The streets are narrow, but run regularly in straight lines: yet it is impossible for a person at one end of a great street to see the other, on account of their extraordinary length, and the dust raised by the crowds of people with which they are daily filled. This city is the great magazine of all Japanese manufactures and commodities, and the chief trading town in the empire. There is scarce a house where there is not something made or sold; for here they refine copper, weave the richest silks with gold and silver flowers, coin money, and print books. The most curious carvings, the best and scarcest dyes, all sorts of japanned cabinets, pictures, musical instruments; all sorts of things wrought in gold and other metals, particularly steel, as the best tempered blades, and other arms, are made here in the utmost perfection. Here also are made the richest dresses; and all sorts of toys, puppets with moving heads, and numberless other things, may be found at Miaco.

Ofacca is commodiously and agreeably situated on the banks of the river Jedogawa, in 34 degrees 50 minutes north latitude. It is defended at the west end by two strong and handsome guard-houses, which separate it from the suburbs, and at the eastern extremity by a strong castle. Its length from east to west, from the castle to the suburbs, is between 3 and 4000 common paces, and its breadth somewhat less. The river, which brings immense riches to the city, runs on the north side; and having washed one-third of it, part of its waters are conveyed through a broad canal to supply the south part, which is the largest, and the residence of the richest of the inhabitants. The better to distribute the waters, several smaller canals are cut out of the large one, through some of the principal streets, while other canals convey the waters back to the river. These are deep enough to become navigable for small boats, which enter the city, and bring the goods to the merchants doors. All these several canals run along the streets with great regularity; and over them are upwards of an hundred bridges, many of which are very beautiful. Here the night-watch make known the hour by different musical instruments: thus, at the first hour, after sun-set, they beat a drum; and on the second, strike upon a brass instrument, called a gumgum, which is in the form of a large flat basson; the third, or hour of midnight, by striking upon a bell with a stick. The first hour after midnight they again beat the drum, the second the gumgum, and the third the bell. This third hour after midnight is the last, and ends with the rising-sun; for both the day and night are by the Japanese divided into six equal parts, or hours, all the year round: Hence those of the day are longer, and those of the night shorter in summer, than they are in winter.

This is the best trading city in Japan, it being extremely well situated for commerce; on which account it is well inhabited by rich merchants, artificers, and manufacturers. Though the city is extremely populous, provisions are cheap; and even what tends to dissipate the mind, and to promote luxury, may be had at as easy a rate here as any where in the world. For this reason the Japanese call Ofacca the universal theatre of pleasures and diversions. Plays are daily exhibited; tumblers, jugglers, and all who

have either some uncommon animal to shew, or animals that have been taught to play tricks, flock thither from all parts of the empire. Hence strangers and travellers daily resort thither; and chiefly the rich, as to a place where they can spend their time and money with greater satisfaction than in any other city of the empire. Yet the water drank at Ofacca tastes a little brackish: they have, however, the best sacki in the empire, which is brewed from rice in great quantities in a neighbouring village, and from thence sent to most of the other provinces, and even exported by the Chinese and Dutch. The castle is situated in a large plain at the north-east extremity of the city. It is square, about an hour's walk in circumference, and strongly fortified with round bastions, according to the military architecture of the country. On the north side it is defended by the river Jedogawa, which washes its walls, after it has received two other rivers. On the east side its walls are washed by the Kasijwarigawa, just before it falls into the Jedogawa. The south and west ends border upon the extremities of the city. The moles or buttresses that support the outward wall are of uncommon bigness, and about seven fathoms thick. These are built to support a high, strong, brick wall lined with free stone, which at its upper end is planted with trees. On entering through the gate, a second castle of the same architecture, but smaller, appears before you; and, having entered this second, you come to the third and middlemost, which, according to the fashion of the country, has the corners adorned with beautiful towers several stories high. A strong garrison is constantly kept here, both for the defence of the imperial treasures, and the revenues of the western provinces, which are deposited here, and to keep those provinces in awe and subjection. The castle and garrison are commanded by two of the emperor's chief favourites, who enjoy their command by turns, each for the term of three years. When one of the governors returns from court to his government, his predecessor must instantly quit the castle, and go to court to give an account of his behaviour: he must not even speak to his successor; but leave the necessary instructions for him in writing in his apartment in the castle. The governors of the castle have no business with the affairs of the city, or its governors, though they are superior to them in point of rank.

SECT. VI.

The pretended Origin of the Japanese inseparably connected with the Government. Their History and Laws. The Portuguese expelled. The Power and Dignity of the Secular Emperor; and of the Dairi and his Court. The Civil Policy observed in the Government of the Cities; the Ceremony of trading on the Crucifix at Nagasaki; and the solemn form of a Japanese Oath.

THE government and religion of the Japanese are so closely connected with their pretended origin, that it is impossible to separate them. These people are highly offended at the supposition of their being descended from the Chinese, or any other nation; for they pretend, that they arose within the compass of their own empire, and esteem themselves the offspring of their gods, who, during an inconceivable number of ages, governed that empire, in a regular succession from father to son. Of these gods they imagine there were two races; the first perfectly divine; and the last, which descended from the former, partly divine; and partly human. But who were the subjects of these imaginary deities, they do not presume to determine; for they imagine, that the present inhabitants were descended from Awase Dsu no Mikotto, the last of this second race; and that their original ancestors were all of them his children by his wife the goddess Itarami Nomikotto. Thus, though they trace their original, as descended from the gods, many thousand years before the Chinese, for each of these imaginary deities reigned during a long succession of ages, yet they place the original of the present inhabitant so late as about 600 years before Christ, when the genuine history of Japan begins with the reign of Sin Mu Ten Oo, the elder son of Awase Dsu No Mikotto. To the dairi, or ecclesiastical hereditary emperors, who are said to descend in a direct line from his heirs of the eldest branch,

the people attributed an almost divine power, and an unlimited authority over their fellow-creatures; while these emperors, proud of their illustrious and divine extraction, assumed a superstitious holiness, supported by the utmost pomp and magnificence. As they were respected as gods, they thought it beneath their dignity to trouble themselves with the management of political affairs; these therefore they left to the laity. In consequence of this, the power of the nobility increased, and those princes of the empire not only made themselves sovereign and independent in the provinces the emperor had committed to their government, but quarrelling with the princes their neighbours, attempted by force to dispossess each other of their dominions. Hence all suffered the dreadful effects that spring from ambition, jealousy, enmity, and a thirst of revenge.

At length, in order to check the insolence and ambition of the princes of the empire, the crown-general was sent against them at the head of the imperial army. This important post was commonly intrusted to one of the emperor's sons, and in time became the foundation of the secular monarchy; for about 500 years ago, Joritomo, the crown-general, being disappointed in his hopes of succeeding to the imperial throne, assumed the sovereignty in secular affairs, and is therefore mentioned in the history of Japan as the first secular sovereign. The power of the ecclesiastical monarch was, however, still very great; and he had the privilege of nominating the person who should succeed to the high office of secular: but, in the sixteenth century, the latter sovereign made himself absolute sovereign in the secular government of the empire. He was the dairi's second son, and being excluded by his birth from the succession to the imperial throne, he forcibly maintained himself in the command of the army, and stript the emperor, his father, of all his authority in the management of secular affairs. But he was far from enjoying in peace the possession of the throne; for many of the most powerful princes of the empire disputed it with him, till at last, in the year 1583, a common soldier, named Taico, a man of an obscure birth, but of an enterprising genius, obtained the crown. At first indeed he had only 50 soldiers, who were of intrepid courage; but their number soon increased to a great army, and he carried on his conquests with equal celerity and success; so that in a few years he subdued all the contending princes, took their cities and castles, seated himself on the imperial throne, and the dairi, or ecclesiastical emperor, was obliged to yield him the entire possession of the secular government; while he, knowing the prejudices of the army and all the people in favour of their ancient monarchs and high-priests, freely allowed him to be supreme in spirituals, and to enjoy the high honours and prerogatives that were before annexed to his office. To humble the nobility, and keep them in subjection, he obliged them to bring their wives and families to his court at Jedo, where they were to remain as hostages of their fidelity: while those princes themselves were obliged to attend him six months in the year, and every year to renew their oath of fidelity.

The ambition of the princes of the empire being thus curbed, and their power broken, he next secured the new modelled authority of his government, by preserving it from the seditious rage of the licentious vulgar by a system of new laws; which were perhaps the most severe that ever were enacted, and, like those which Draco gave to the Spartans, may be justly said to be written with blood: for there is scarce a crime that is not publicly punished with death, except the criminal be a prince, and then he has only the privilege of dispatching himself, which is commonly done by ripping up his own bowels. In this case the emperor sends his order by letter, which if not immediately complied with, the person is either put to the most excruciating tortures, or, if he be a prince of the royal blood, banished to some barren island, where he is perhaps forced to suffer a life more severe and painful than death itself. But in other cases the criminal is no sooner found guilty, than he is hurried to execution. A lie, or perjury; theft, though of the smallest kind; a breach of the peace; a blow with a sword, even though the scabbard be on; cheating, even at play; detraction, or any other injury done to a man's character, are all punished with death: for mere chastisements are seldom used but by the lords to their slaves. In some provinces fathers of families, except those of the lower rank, have power over the lives and

and limbs of their wives, children and domestics. But in crimes against the government, as neglecting to obey the emperor's edicts, cheating him in his revenue, counterfeiting the coin, setting a house on fire, robberies, burglaries, debauching a married woman, or ravishing an unmarried one; injustice or mal-administration in public officers, whether in governors, judges or magistrates; the punishment is not confined to the criminals, but inhumanly extended to his parents, brethren, children, and more distant relations, all of whom are put to death at the same hour, though at ever so great a distance from each other. This is done by respiting the execution of those who are near, till the sentence can be conveyed by proper couriers to the other places; and then, on the appointed time, all are brought forth, and executed at mid-day: but the female relations are commonly only sold for slaves, for a longer or shorter term of years, according to the nearness of their relation to the offender, and other circumstances, except in cases of high-treason, where the wives and daughters are put to death. For thefts and robberies, the unhappy criminals are crucified with the head downwards, and consigned to a longer or shorter torture, according to the nature of the crime: so that, in cases of aggravated guilt, they are left to hang on the cross till they expire, which in some is not till after three or four days: but if the thief admits of a milder death, they are dispatched by a dagger, or by strangling. In cases of high-treason, not only all the relations, but the whole ward in which they live, undergo the same dreadful fate; for, in these cases, the law supposes that they are worthy of death for suffering such enemies to society to live among them; and this cruel punishment of the innocent is an effectual means of causing the criminal, when known, to be immediately discovered, since the informer not only saves himself, but his whole family.

These laws, contrary as they are to every sentiment of equity and humanity, are still in force, and executed with the greatest rigour; but criminals, as soon as they find they are discovered, frequently avoid a too severe punishment, by stabbing themselves, or ripping open their bellies.

As a farther security to the new-established government, and the safety of the emperor, it was now resolved, that the empire should be shut up for ever, and thoroughly purged from foreigners and foreign customs. No foreigners had got so strong a footing in the empire as the Portuguese, who first discovered the country in the year 1543, when, being invited by the prospect of gain, they had made large settlements in Japan, and with their foreign commodities, with the doctrine taught by the missionaries, by which it is said they gained over one-third of the people, and even several of the princes of the empire, and by the marriages contracted between the Portuguese and the new converts, they so ingratiated themselves into the favour of the nation, that, flushed with their success, they projected a revolution in the government. The emperor was struck with horror and surprize at the sight of two letters which laid open their treacherous designs, one of which was intercepted by the Dutch, who were then at war with Portugal, and seized this opportunity of discovering their designs, in hopes of gaining this profitable branch of trade to themselves; and the other was sent over by the Japanese from Canton, in China. The Japanese priests could not, without the greatest envy and regret, see their old religion, with all its powerful attractives of profit and popular esteem, daily losing ground; and heavy complaints were instantly made at court by one of the chief counsellors of state, who being met on the road by a jesuit bishop, the haughty prelate refused to pay him the same deference and respect which he was intitled to receive from the natives. The excessive profits the Portuguese received, and the immense treasures they sent out of the country, also touched the government to the quick; while the rapid progress made by the new religion, the union of the converts, and the hatred they bore to the gods and religion of their country, filled the emperor and his court with dreadful apprehensions.

Taico, the emperor, therefore began to put a stop to the increase of the Portuguese interest, and the propagation of their religion; he however made a slow progress, and dying soon after in 1598, left the work to be finished by his successors, who placed him among the gods by the

name of the Second Fatzman, or Mars of the country. The Portuguese, with their clergy and Japanese kindred, were ordered to depart the country, under the penalty of suffering the pain of crucifixion; all the other Japanese were commanded to stay at home; those who were actually abroad were to return within a certain limited time, after which they should be liable, if taken, to the same punishment; and those who had embraced the new religion, were commanded to forsake it. These orders were the beginning of a most dreadful persecution; for the new converts being unmoved by the weak reasons that were urged against their faith, the sword, the halter, the cross, and fire, were barbarously and vainly used as arguments to convince their understandings, and to render them sensible of their error. Yet death in all these various forms was far from shaking their fortitude; for they bravely sealed their faith with their blood, and shewed such amazing examples of constancy, that their enemies were filled with surprize and admiration. This cruel persecution, which exceeded every thing of the kind mentioned in history, lasted about forty years, when at last all the remains of christianity in Japan were exterminated in one day; for upwards of 37,000 christians, being reduced to despair at beholding the insufferable torments endured by their brethren, took up arms, and got possession of the castle of Simabara, seated upon the sea-coast, with a firm resolution of defending their lives till the very last; but after a siege of three months, the castle was taken on the 12th of April, 1638, and all who remained alive were cruelly butchered. Thus was the Japanese empire cleared from christianity by the death of the christians, and that nation shut up to the natives as well as foreigners. In vain did the Portuguese at Macao afterwards send thither a splendid embassy; neither the law of nations, nor the sacred characters of ambassadors, were sufficient to protect them; for those ambassadors, and their whole retinue, to the number of sixty-one persons, were beheaded by the special command of the emperor, except a few of their meanest servants, who were saved, that they might carry to their countrymen the melancholy news of their barbarous reception.

The present emperors of Japan are as despotic as any of the dairi ever were. It has been already observed, that as he has a great number of petty princes and nobles, who have absolute power in their several governments, the greatest care is taken to keep them in due subjection. Of these 21 bear the title of kings, 6 are princes, 4 are dukes, 17 are counts, and 41 are lords, or something equivalent to these dignities, besides a great number of noblemen of inferior rank. The emperor's council consists of the former, who are obliged to attend in their turns, and have always four of the kingly dignity at their head. The emperor's standing forces, including garrisons, &c. consist of 100,000 foot and 20,000 horse; but in time of war each of the governors of the provinces is obliged to bring into the field a body of horse and foot ready armed, proportionable to the extent of his province, or to the pension he receives from the emperor; which, in all, amount to 368,000 foot and 38,000 horse. Their weapons are fire-arms, javelins, bows and arrows, sabres and daggers. The horse wear cuirasses, and the foot helmets, finely wrought.

From what has been before observed, the reader may form some idea of the numerous court of this monarch in his capital, since it must consist of one half of the princes and nobility of the empire, together with all their families, besides his own officers and guards, which generally amount to about 5 or 6000 men. He has, as we have already observed, many places magnificently built and furnished, in which the royal apartments, halls of audience, &c. are enriched with every thing curious and costly in art or nature. The ceilings are generally plated with gold, finely wrought and embellished with precious stones; and the beds, screens and cabinets, with the gardens, walks, ponds, fountains, terraces, groves, and summer-houses, are answerable to the grandeur of the place. But of all the royal palaces, that of Jedo, where he most resides, and which we have already described in treating of the buildings of Japan, is the largest and noblest: the rest, though grand and sumptuous, are only as houses of pleasure, for his diversion in hunting, fishing, and other recreations.

It is very surprising that the emperors should still allow the dairi to be treated with the same profound veneration

that was formerly paid him by his ancestors: for though he has lost the greatest branch of his power, and is only head over all religious matters, while the emperor enjoys not only the imperial dignity, but the government both in civil and military affairs, yet he is allowed to preserve his pristine grandeur. He is not suffered to set his foot on the ground, and wherever he goes, is carried on men's shoulders. He is kept so retired, that the sun is not thought worthy to shine on his head, or the wind to blow upon him. He never wears the same cloaths above one day, or eats above once out of the same dishes, and all the vessels and utensils of his table are new every day; but these, though very clean and neat, are made only of common clay, and are generally broke; for they imagine, that if any layman should presume to eat his food out of those sacred dishes, it would swell and inflame his mouth and throat. He is addressed in pompous titles little short of blasphemy; and all, except the emperor, when they speak to him in public, prostrate themselves flat on the ground; besides, as every thing belonging to his person is esteemed sacred, he never shaves his beard, cuts his hair, or pares his nails. He is chiefly served by his twelve wives, whom he marries with great solemnity, and, like the other monarchs of the East, keeps himself as much as possible concealed. Upon the decease of the dairi, the ministry of that ecclesiastical court chuse for his successor the next heir, without regard to age or sex; hence it has often happened, that a prince under age, or a young unmarried princess, has ascended the throne; and there are instances where the deceased dairi's relict has succeeded her husband.

The secular emperor now grants the necessary subsidies for the maintenance of the dairi and his ecclesiastical court. For this purpose the dairi is allowed the whole revenue of the city of Miaco; and that being insufficient to defray his expences, it has been agreed to make up the deficiencies out of the emperor's treasury: but these allowances are so small, and so indifferently paid, that the court cannot make that figure which they formerly did, when the dairi himself was master of the empire, and had all the revenues at his own disposal. They still, however, endeavour to keep up their former grandeur and magnificence; and this court may be truly said to be remarkable for a splendid poverty. The great run in debt, and the inferior officers and servants, whose salaries are far from being sufficient to maintain them, must work for their living: but though the revenues of the dairi are small in comparison of what they were formerly, yet, as he has the management of them, he is sure to take care to provide whatever is necessary to keep up as much as possible his former splendor, and to satisfy his luxury and profuseness. This he is the better able to accomplish, as he still enjoys the high privilege of bestowing titles of honour on the great men of the empire, their children and relations, which brings him in vast treasures. Among his twelve wives, she who is the mother of the hereditary prince, or princess, has the title of empress: but it would take up too much room, were we here to describe the pompous ceremonies observed in his marriages, upon the birth of an heir to the crown, and on chusing a nurse for the royal infant: these are magnificent beyond expression; nor could they be more so, if the welfare and happiness of the whole empire depended on these events.

All who belong to the dairi's court are clothed after a particular manner, and their habits are very different from those of secular princes, whom they scorn and despise, as being of a mean and unholy extraction. They wear long wide drawers, and a large gown with a long train, which they trail after them on the ground. Their heads are covered with a black lacker'd cap, by the shape of which, among other marks of distinction, is known what quality they are of, and what post they enjoy. Some have a large band of black silk or crape sewed to their caps, which either hangs down behind their shoulders, or is tied up. Others have a kind of flap, like a fan, standing out before their eyes. Some have a sort of scarf hanging down before from their shoulders, the length of which is different according to the quality of the wearer: for it is the custom of this court, that nobody bows lower than just to touch the floor with the end of his scarf. The dress of the women of this court is also different from that of secular women; particularly the dairi's twelve wives, who, when full dressed,

are so loaded with large wide gowns of silk, interwove with flowers of gold and silver, that it is difficult for them to walk.

An application to different kinds of learning forms the chief amusement of the dairi's court; and not only the courtiers, but many of the fair sex, have acquired great reputation by their poetical, historical, and other writings. All the almanacks were formerly made there; but though this is not now the case, they must receive the approbation of the court. They are great lovers of music, and the women in particular play with great dexterity on all the musical instruments they are acquainted with; the young noblemen also divert themselves with riding, running races, dancing, and other exercises.

When the dairi was sole master of the country, he honoured with his sacred presence whatever city he pleased; and it seldom happened that two succeeding emperors chose the same place of residence. The dairi's court is now fixed at Miaco, where he has a large and spacious palace, distinguished by its having a lofty and magnificent tower. His imperial consort lives with him in the same palace, and the palaces of his other wives are situated next to his. At a small distance are the houses of the lords whose offices require a constant and more immediate attendance on his person; there are also a number of other palaces and streets, divided among the officers belonging to the court according to their rank, and all separated from Miaco, and defended against the sudden approach of an enemy, by walls, gates, ditches, and ramparts. The secular monarch constantly keeps a strong guard of soldiers at the dairi's court, in appearance out of tenderness and care for the preservation and safety of his sacred person and family; but most probably in order to put it out of his power ever to attempt the recovery of the supreme authority.

Every imperial city is committed to the care of two governors; Nagasaki alone has three. These have the command of the city by turns, each generally for the space of two years. When the time is expired, he delivers up his power and his apartment in the palace to the other governor, and immediately sets out for Jedo, to make the usual presents, and give an account of the most material transactions of his government. He stays at Jedo about six months, during which he is at liberty to live with his family: but as soon as he has received orders from the council of state to depart to his last, or to any other government, he must set out, leaving his wife and children at Jedo till his return, in a manner as hostages of his fidelity: nay, while he is in his government, he is to admit no woman within the space of his residence, on pain of incurring the imperial displeasure, the fatal consequences of which are no less than death, banishment, or imprisonment, with the entire ruin of his family; it being esteemed beneath the majesty of the emperor to inflict slighter punishments on the least disregard shewn to his commands. Their salary is but small; but their perquisites are so considerable, that in a few years time they might get great estates, were it not for the presents that must be made to the emperor and the grandees of his court, and their being obliged to keep up all that state and grandeur which is thought becoming the dignity of their employment, and the majesty of their master.

Under the imperial governors are four magistrates, and their deputies. These magistrates hold their office a year; but they are obliged daily to communicate to the governor every thing that comes before them; and in difficult cases, or where they cannot agree among themselves, to lay the cause before the emperor's bench or court of justice, or, with the consent of that court, to leave it to the determination of the governor in the last resort. All civil affairs are brought before this imperial court of judicature, which, having examined the parties and their witnesses, give judgment according to the laws of the empire, and their imperial orders and proclamations. From this court there is no appeal; but those who have received sentence of death cannot be executed without a warrant signed by the council of state at Jedo, which must be also consulted in all affairs of great moment.

The deputies of the magistrates are next to them in authority, but enjoy their posts for life. It is one branch of their office to compose differences of small consequence arising in that part of the town committed to their care.

Next to these are four officers, who enjoy their post only one year, and are appointed by the magistrates to make a faithful

faithful report in their name to the governor, of the daily transactions in the execution of their office; and being also a kind of representatives of the people, whose interest they are to promote at the governor's court, they have a small room assigned them in his palace, where two of them constantly attend till the governor is at leisure to receive the messages they are to deliver in the name of the magistrates, or the petitions they are to present him with in the name of private persons.

Among the inferior officers are the town messengers, who also serve as bailiffs and constables, and commonly live together in one street. They are chiefly employed in pursuing and arresting of criminals, and sometimes in public executions, chiefly in beheading. But no profession is so much despised by the Japanese as the tanners, who take off the skins from the dead cattle, in order to dress and tan them for shoes, slippers, and the like. They live by themselves near the place of execution, and are obliged to put prisoners to the torture, to crucify them, or put them to any other death whatsoever. The keepers of bawdy-houses are obliged to lend them their servants to assist them at public executions.

Having thus given an account of the officers in general, we shall now proceed to the policy and regulations observed in every street, in order to keep a watchful eye over the conduct of the inhabitants, and to ease the governors, magistrates, and other chief officers, in the discharge of their duty. For this purpose they have the following officers for every street; the principal is the *otona*, who gives the necessary orders in case of fire, sees that a regular watch be kept at night, and that the orders of the governors and magistrates be punctually executed. He keeps books in which he enters the children born, the persons who marry, travel, die, or remove out of the street; and the names, birth, and trades of such new inhabitants as come into it. In case of small differences arising between the inhabitants of his street, he summons the parties before him, and, in conjunction with the deputies of the magistrates, endeavours, if possible, to reconcile them. He punishes small crimes by seizing the criminals, and putting them in irons. He causes criminals to be taken up by his own people within his district, and confines them till he receives farther orders from the superior magistrates, before whom he lays all criminal affairs and cases of moment; and is himself answerable for what accidents happen within the street under his inspection. He is chosen by the inhabitants of that street from among themselves, each of them writing upon a piece of paper the name of the person he would have preferred to this dignity, adding his own name and seal. The votes are all taken in, the papers opened, and the names of those who have most votes are laid before the governor, with the petition of the inhabitants that he would be pleased to nominate one of them as *otona*. His salary is a tenfold portion out of the treasury of the street.

Every *otona* has three deputies, who give him their advice and assistance in the execution of his office.

In every street the inhabitants are divided into companies of five men, of which there are ten or fifteen in every street: but though these are termed companies of five, a few more of the neighbours are frequently added, so that they sometimes consist of ten or fifteen heads of families, all of whom must be the proprietors of the ground and houses in which they live; for those who have no houses of their own, notwithstanding their being inhabitants of the same street, are not admitted into those corporations, but considered as tenants dependant on the landlords, and are therefore exempted from taxes and other burdens, except the night-watch and round, in which they are obliged to serve themselves, or to get somebody to serve in their stead, it being a duty which all the inhabitants are forced to observe in turn. These tenants have no vote in the election of the officers of the street, nor any share in the public money; and besides, the rents they pay to the landlords are very high, considering the smallness of the houses in which they live. Each of these little companies has one of its own body at their head, who is answerable for their actions; and if they be contrary to law, he shares with the rest of the members the penalty they are sentenced to undergo by the supreme magistrate.

Every street has also a secretary, or public notary, who writes and publishes the commands of the *otona* to the

inhabitants of the street, and gives passports, testimonials, and letters of dismissal. He keeps the *otona's* books, as the list of the houses and their inhabitants, with their names, age, trade, and religion: the names of all who die in the street, with the time and manner of their death: a register-book of the passports that have been issued out of the office, with the names of the persons to whom they were granted, the business which called them abroad, the time of their departure and return: and also a journal of the daily occurrences that happen within the compass of the street.

The next officer is the treasurer of the street, who keeps the public money, and from time to time accounts for it to the rest of the inhabitants, specifying the sums he has received and paid out. The public treasure chiefly consists of the sums the magistrates of the city order to be detained from the price of foreign goods, for the joint benefit of the inhabitants, among whom it is equally distributed, according to the number of the streets, in order to enable them to pay the additional taxes levied upon them; but this is peculiar to Nagasaki, which is the only imperial city where the trade with foreigners is permitted. The inhabitants serve this office each a year in turn.

There is another officer, named the messenger of the street, who is to give information when any body dies, or when any thing else happens that is esteemed worth their notice. He also delivers to the chief officers the petitions of the inhabitants of the street, collects the contribution-money for the present which at certain times is made to the governors and chief magistrates, tells the commands of the magistrates to the heads of the companies, and publishes them in the street.

Two watches are kept for the security of the streets during the night. The first is the chief guard, upon which the inhabitants do duty themselves, three at a time. They have a room or house assigned them towards the middle of the street, or at the corner of a cross street. Upon days of great solemnity, or when the magistrates think this watch necessary, it is kept all day; and when they are apprehensive of danger it is doubled, in which case the *otona* assists in person, with one of his deputies: for should any misfortune happen that could be any way attributed to their carelessness or neglect, they and the whole street would be severely punished for it. Such regard is paid to this watch, that the opposing or insulting it is a capital crime.

The other guard is appointed to watch against thieves and accidents of fire, and to give notice upon the least suspicion. It consists of two of the poorest inhabitants of the street, sitting in a centry-box at each gate by which the street is shut up in the night: but, at certain intervals, they walk till they meet, shewing the hours of the night generally by beating two sticks one against the other. In some towns there is a small hut built at the top or side of a house, about the middle of the streets, on purpose for a man to watch accidental fires.

If an inhabitant designs to remove from the house and street in which he lives to another, he must first apply to the *otona* of the other street, and making him a present of a dish of fish, give him a petition expressing his desire to be admitted among the inhabitants of that street. The *otona*, upon this, makes enquiry into his life, character, and conduct, and then sends his messenger of the street to every one of the inhabitants, desiring to know if they will consent to admit the petitioner as a neighbour; and if any one of the inhabitants opposes his admission, urging that he is a drunkard, quarrelsome, or addicted to any other crime, and that he will not be answerable for the consequences, it is sufficient to exclude him. But if he obtains all their consents, the petitioner must apply to the public notary of his former street for a certificate of his behaviour, and a letter of admission, both signed by the *otona*, and these must be carried by the street-messenger to the *otona* of the street to which the petitioner intends to remove; upon which he receives him under his protection, and incorporates him among the inhabitants of his street. Mean while he is not answerable for the petitioner's behaviour before his delivery of those instruments; and should he be found guilty of any crime committed before that time, it would be laid to the charge of the street in which he formerly lived. After his being admitted among the inhabitants of the new street, and his name entered in the register-books, he solemnizes his entry with a handsome dinner; which he gives

either to the company of five, or, if he pleases, to the whole street. His greatest trouble, however, still remains, and that is his selling his old house; for this cannot be done without the consent of all the inhabitants of the street, who often oppose it for upwards of a year, the buyer, for whose crimes they are for the future to suffer, not being sufficiently known, or not agreeable to them. Supposing all obstacles at length removed, the buyer is to pay an eighth part of the price into the public treasure of the street, five parts of which are to be equally distributed among the inhabitants, for the pains they have taken on account of the purchaser's admission, and the three remaining parts are designed for a public dinner. This, however, is seldom given: but the new inhabitant has no sooner taken possession of his house, than all his neighbours come to wish him joy, and to offer him their services.

When an inhabitant of a street is accused of any misdemeanor, his case is laid before the street council, that is, the *otona*, his three deputies, and the heads of the small companies; when, if the affair be too intricate for them to determine, they lay it before the council of the town; if they meet with the same difficulties, the *Nengio*, or four annual officers under the magistrates, are desired to confer upon the affair with some of the stewards of the governor's household; and if they find it necessary, to communicate it to the governor himself.

If quarrels or disputes arise in a street, either between the inhabitants or strangers, the next neighbours are obliged to part them; for if one should happen to be killed, tho' it were the aggressor, the other must inevitably suffer death, notwithstanding his alledging that it was done in his own defence; and he knows no other method of preventing the shame of a public execution, than by ripping up his own belly. Nor is his death thought a sufficient satisfaction to their laws: three of those families who live next to the place where the accident happened are shut up in their houses for three, four, or more months, and rough boards nailed across their doors and windows, after they have prepared for this imprisonment by getting the necessary provisions; and the rest of the inhabitants of the same street are sentenced to pass some days or months in hard labour at the public works. These penalties are inflicted in proportion to their guilt, in not endeavouring to the utmost of their power to prevent the fatal consequences of such a quarrel. A like punishment, but greater in degree, is inflicted on the heads of the companies of five in that street where the crime was committed; and it is an high aggravation of their guilt and punishment, if they knew beforehand that the persons were of a quarrelsome disposition, or, in other cases, were inclined to the crime for which they suffer. The landlords, and also the masters of the criminals, partake of the punishment inflicted for the misdemeanors of their lodgers and servants. Whoever draws his sword, though he does not hurt or even touch his enemy, must, if the fact be proved, suffer death. If an inhabitant flies from justice, the head of the company of five to which he belongs must follow, or hire people to follow him till he be found, and delivered up to the civil magistrate, under pain of corporal punishment.

There is a very remarkable ceremony observed only in the city of Nagasaki, where the Christian religion had the strongest footing. This is called the figure-treading: for in the beginning of the year they trample, with great ceremony, upon a crucifix, an image of the Virgin Mary, or some other saint, as a proof of their renouncing the Christian religion. They begin in two different parts of the city, going from house to house, and street to street, till all the people, both old and young, have trampled on these images, which are of brass, and about a foot long: even young children, unable to walk, are held down by their mothers to touch the images with their feet.

It is remarkable, that there is no other tax laid upon the inhabitants, but that on the land of those who have houses or pieces of ground of their own; which may properly be considered as a ground-rent; except we may call a tax the voluntary contributions for a present to be made to the governors by such persons as have hereditary lands and tenements in their possession within the city of Nagasaki, or the presents made to superior officers by the inferior.

As oaths are a civil security as well as a religious obligation, we shall here mention the form of those of Japan.

The person who takes an oath invokes the vengeance of the supreme gods of the heavens, and of the chief magistrates of his country, upon him, his family, his domestics, his friends, and near relations, in case he does not sincerely fulfil all the articles he swears to perform; after which he signs both the words of the oath and those articles, and dipping his seal in black ink, seals them; and, as a farther confirmation, lets fall some drops of his own blood upon the seal, by pricking one of his fingers behind the nail.

S E C T. VII.

Of the Religion of the Japanese; particularly the Sinto, the Budso, and the Religion of the Philosophers.

THEIR religion is in general the grossest heathenism and idolatry; but religious liberty, so far as it is allowed not to interfere with the interest of the secular government, or to affect the peace and tranquillity of the empire, has always been allowed in Japan: hence foreign religions have been easily introduced, and propagated with success; there are therefore many religions in Japan, the principal of which are the three following:

- I. The Sinto, or ancient idol-worship of the Japanese.
- II. The Budso, or foreign idol-worship, introduced into Japan from the empire of China and the kingdom of Siam; and
- III. The religion of their philosophers and moralists.

I. As to the Sinto's religion, it deserves to be considered in the first place, more on account of its antiquity, than for the number of its professors. These have some obscure and imperfect notions of the immortality of the soul, and a future state of bliss or misery, and yet worship only those gods whom they believe are peculiarly concerned in the government of the world; for though they acknowledge a Supreme Being, who they believe dwells in the highest heaven, and admit of some inferior gods, whom they place among the stars; yet they do not worship and adore them, nor have they any festival-days sacred to them, thinking that beings so much above us, will concern themselves but little about our affairs. They, however, swear by these superior gods: but they alone worship and invoke those gods whom they believe to have the sovereign command of their country, and the supreme direction of its elements, its produce, and its animals; and who, by virtue of this power, will, they suppose, not only render them happy here, but, interceding for them at the hour of death, procure for them rewards proportionable to their former behaviour. Hence their dairs, or ecclesiastical emperors, being esteemed lineally descended from the eldest and most favoured sons of these deities, the supposed heirs of their excellent qualities, are considered as the true and living images of their gods, and possessed of such an eminent degree of holiness, that none of the people dare presume to appear in their presence. In short, the whole system of the Sinto's divinity is a lame and ridiculous jumble of absurdities, and would not perhaps have stood its ground so long, had it not been for its close connection with the civil customs, in the observance of which this nation is exceedingly scrupulous.

The temples of the Sintoists are exceeding mean; within them is hung up white paper, cut into small bits, as emblems of the purity of the place; and sometimes there is a large mirror in the middle, that the worshippers, when they behold themselves, may consider, that as distinctly as all their bodily defects appear in the mirror, so conspicuous do the secret stains of their hearts appear before the eyes of the immortal gods. These temples are frequently without any visible idols of the gods to whom they are consecrated, they being locked up in a case at the upper end, and to this case the people bow. These temples are not attended by priests, but by seculars, who are, generally speaking, entirely ignorant of the principles of the religion they profess, and wholly unacquainted with the history of the gods they worship. These, when they go abroad, are dressed, for distinction sake, in large gowns, commonly white, but sometimes yellow, and sometimes of other colours; however, they wear their common secular dress under them. They shave their beards; but let their hair grow, and wear a stiff,

*Act of trampling over the Images of Our Saviour & the V.^g Mary,
at the beginning of the New Year, at Nagasaki.*

stiff, oblong, lacker'd cap, resembling in shape a ship, tied under their chins with twisted silk strings, terminated with tassels, which hang lower or higher according to the office or quality of the person who wears them, who is not obliged to bow lower to persons of superior rank than to make these tassels touch the floor. Their superiors have their hair twisted under black gauze or crape, in a very particular manner; and have their ears covered by a kind of flap, which stands out or hangs according to the dignities or honourable titles conferred upon them by the dairi. They are under his direction in spiritual affairs; but in temporals they and all the other ecclesiastical persons in the empire are under the command of two imperial temple judges, appointed by the secular emperor. Their haughtiness and pride exceed all expression; for when they appear in a secular dress, they, like the nobles, wear two sabres, and think it becomes their station to abstain from all communication and intimacy with the common people.

The Sintoists do not adhere to the doctrine of the transmigration of souls; yet abstain from killing and eating of those beasts that are of service to mankind, because they imagine that slaying them would be an act of cruelty and ingratitude. They believe that the soul, after its departure from the body, is removed to the high and subcelestial fields, seated just beneath the thirty-three heavens, the dwelling-places of their gods: that those who have led a good life find an immediate admission, while the souls of the wicked and the impious are denied entrance, and condemned to wander till they have expiated their crimes; but they admit no hell or place of torment. One of the essential points of their religion is, that they ought to preserve an inward purity of heart, consisting of the doing or omission of what they are ordered to do or avoid by the law of nature and the dictates of reason, or the more immediate and special command of the civil magistrate. They have no form, either by divine or ecclesiastical authority, for regulating their outward conduct. Hence it may be imagined, that they would indulge, without restraint, every gratification of their wishes and desires, as being free from the fear of acting contrary to the will of the gods, and little apprehensive of incurring the effects of their displeasure; but they have a powerful ruler within their own hearts, the friendly and tender sensibilities of humanity, which, aided by the force of reason, and the severity of the laws, restrain them from the indulgence of vice, and are sufficient to win over to the dominion of virtue all that are willing to hearken to her dictates.

Another essential point of the Sinto's religion is a rigorous abstinence from whatever makes a man impure. This consists in abstaining from blood, from eating of flesh, and being near a dead body; by which a person is for a time rendered unfit to go to the temples, to visit holy places, and to appear in the presence of the gods. Whoever is stained with his own or another's blood, is for seven days unfit to approach the holy places; and if, in building a temple, one of the workmen happens to be hurt, so as to draw blood, he is from thenceforward rendered incapable of working on that sacred building. But if the same accident should happen in building or repairing any of the Sinto's temples at Isje, the temple itself must be pulled down and rebuilt. Whoever eats the flesh of any four-footed beast, deer only excepted, is unclean for thirty days: yet whoever eats a wild or tame fowl, water-fowls, cranes, and pheasants, is unclean only a Japanese hour, which is equal to two of ours. Whoever kills a beast, or is present at an execution, attends a dying person, or enters a house where a dead body lies, is unclean for that day; and the nearer a person is related to the deceased, so much the greater is the impurity. By not observing these precepts people are rendered guilty of external defilement, which they say is detested by the gods, and made unfit to approach their temples.

The other great points of their religion are, 1. A diligent observation of the solemn festivals, which are very numerous. 2. Pilgrimages to the holy place at Isje: that is, to the temple of Tensio Dai Sin, the greatest of all the gods of the Japanese. The last essential doctrine of their religion is, that they ought to chastize and mortify their bodies; but few of them pay much regard to this precept.

The orthodox Sintoists go in pilgrimage to Isje once a year, or at least once in their lives; for, besides their con-

sidering it as a duty, they imagine they shall reap great advantages from this journey, such as being absolved from all their sins, and receiving the assurance of immediate happiness after death, besides having in this life the possession of health, children, riches, dignities, and other temporal blessings. To keep alive these sentiments in the minds of the superstitious vulgar, every pilgrim is, for a small consideration, presented by the canuses, or secular priests, with an instrument containing the remission of their sins. This pilgrimage is made at all times of the year, but chiefly in the three first months, March, April, and May, when the fineness of the weather renders the journey very agreeable and pleasant. Every one is at liberty to travel in what manner he pleases; those who are able do it at their own expence, in sedans, or on horseback, with a retinue suitable to their rank: but the poor go on foot, living on charity. These carry upon their back a straw mat rolled up, which serves them for a bed, and have a staff in their hands. They have a vessel hanging to their girdle, out of which they drink, and wherein they receive the charity of the people. Generally their names and the place from whence they came, are written both upon this vessel and on their great hat made of split reeds, that in case of sudden death, or any other accident upon the road, it may be known who they are, and to whom they belong: These who can afford it wear over their other clothes, a short white coat, without sleeves, with their names stitched upon the breast and back. Incredible multitudes of these pilgrims crowd the roads. The very children, if apprehensive of a severe punishment for their faults, will run away from their parents, and go to Isje, to fetch an ofarrai, which, upon their return, is deemed a sufficient expiation of their crimes, and a sure means of procuring a reconciliation. When a pilgrim is about to undertake this holy journey, he must religiously abstain from every thing impure, particularly from fornication, and even lying with his own wife; tho' otherwise complying with matrimonial duties is not thought displeasing to the gods. After he is set out on his journey, a rope, with a piece of white paper twisted round it, is hung over the door of the house, to inform all who are impure, from the death of their parents or near relations, to forbear entering; from the opinion that it would occasion the pilgrim's having strange uneasy dreams, or his being exposed to some misfortune.

The temple of Isje is seated in a large plain, and is a low thatched wooden building, as a monument of the simplicity and poverty of its original founders. In the middle of it is a mirror of polished metal, as an emblem of the all-seeing eye of the god, and his knowledge of what passes in the inmost recesses of the worshippers hearts; and some cut paper is hung round the walls, to represent the purity of the place. This principal temple is surrounded with near a hundred small temples, built in honour of inferior gods; the greatest part of which are so low and small, that a man can scarcely stand upright in them; but each is attended by a canusi, or secular priest. Next to the temple are the houses of the officers of the temple, who stile themselves the messengers of the gods, and keep lodgings for the accommodation of pilgrims. At a small distance is a town that bears the same name with the temple, and is inhabited by inn-keepers, paper-makers, book-binders, cabinet-makers, joiners, and other workmen, whose business depends on the holy trade carried on there.

On the pilgrim's arrival at Isje, he applies with great solemnity to one of the canuses, bowing, according to the custom of the country, till his forehead touches the ground; upon which the canusi either conducts him and the other pilgrims, or commands his servants to conduct them to the several temples, and to tell them the names of the gods to whom they were built; which being done, he takes them before the chief temple, where, prostrating themselves on the ground, they address their supplications to Tensio Dai Sin, express their wants and necessities, and pray for health, long life, happiness, riches, and the like. They are afterwards entertained and lodged by the canusi in his own house, if they are unable to bear the expence of lodging at a public inn: they, however, generally make him a present in return for his civility, though it be out of what they got by begging.

The pilgrim having performed all the acts of devotion this pilgrimage requires, the canusi presents him with an

ofarrai, or indulgence. This is an oblong box, about a span and a half long, two inches broad, and an inch and a half high, full of small sticks, some of which are wrapped in bits of white paper, to remind him that he must be pure and humble. Dai Singu, that is, the temple of the great god, printed in large characters, is pasted on the front of the box; and the name of the canusi who gave it, with the title, Messenger of the gods, in small characters, is pasted on the opposite side. This they receive with great tokens of respect and humility, and immediately tie it under their hats to keep it from the rain, wearing it just under their forehead, and balancing it with another box, or a bundle of straw of about the same weight tied behind; but those who travel on horseback have better conveniences for keeping it. When they have got safe home they take great care of the ofarrai, as of a thing of the utmost value; and though its effects are limited only to a year, yet, after that is expired, they place it in one of their best rooms, on a shelf made on purpose. In some places they keep the old ofarraies over the doors of their houses, under a small roof; but the poor, for want of a better place, keep them in hollow trees behind their houses. Large quantities of these ofarraies are annually sent by the canusies into all parts of the empire, to supply those who cannot or will not fetch them. The pedlars who carry those bawbles, resort to the most populous towns towards New Year's-day, which is one of their solemn festivals, and sell at the same time new almanacks, which must be printed no where but at Isje.

The superstitious Japanese are as much inclined to make religious vows as to go in pilgrimage to holy places. Hence there are a great number of religious houses of both sexes, and of many different orders. Among these are the Jamnaboes, a kind of hermits, who pretend to abandon their temporal concerns for the sake of those that are spiritual and eternal: yet those who can live at their ease dwell in their own houses, while the poor stroll and beg about the country. They have been split into two orders; the Tosanfa and the Fonsanfa. Those who embrace the former class must once a year climb to the top of the mountain Fikooan, a journey of no small difficulty and danger, on account of the height and steepness of that mountain, and the many precipices all around it; and besides, it is imagined, that all who presume to ascend it with any degree of impurity, are punished for their impious rashness by being struck with madness. On the other hand, those who enter into the order of Fonsanfa, must once a year go in pilgrimage to the grave of their founder, at the top of an high mountain named Omine; where the air is said to be excessive cold, and the steepness and precipices make its ascent no less dangerous than that of the other. These suppose, that should anyone undertake this journey without being sufficiently purified, he would be thrown down the horrid precipices and dashed to pieces, or at least would pay for his contempt of the anger of the gods by a lingering sickness, or some dreadful misfortune. They therefore qualify themselves by previous mortifications, abstaining from impure food, from lying with their wives, and from whatever may render them defiled. While they are upon their journey, they must live only upon the roots and plants they find on the mountains. If they return safe home, they go each to the general of his order, who resides at Miaco, and make him a small present of money, which, if poor, they must procure by begging, and in return they receive from him a more honourable title, which occasions some alteration in their dress, and increases the respect shewn them by their brethren of the same order. Thus ambition is far from being banished from these societies.

These hermits are however very much degenerated from the austerity of their predecessors, who, in imitation of the example set them by their founder, and pursuant to the rules he laid down, lived upon nothing but plants and roots, expelling themselves to severe mortifications, to fasting, bathing in cold water, and wandering through woods and forests, and through desert and uninhabited places. They have also deviated much from the simplicity of their religion, and have admitted the worship of such foreign idols as they imagine have the greatest influence on the occurrences of life. They also now pretend to be well versed in magical arts, and that, by certain mystical ceremonies, words, and charms, they can prevail on all the gods of the country, as well of the Sintoists as those of the Buddoists,

to drive out evil spirits, to assist them in diving into secrets, recovering stolen goods, and in finding out thieves; in foretelling future events, explaining dreams, in curing desperate diseases, and in finding out the guilt and innocence of persons accused of crimes. They talk with great assurance of the wonderful virtues of their charms, pretending that they are able to handle burning coals and red-hot iron, without receiving the least hurt; suddenly to extinguish fires, to make cold water instantly boil and hot water in a moment cold; to keep people's swords so fast in the sheath, that no force is able to draw them out; to preserve themselves from being hurt by these or any other weapons, and to perform many other things of the like nature, which, if closely examined, would perhaps be found to be juggler's tricks, and the effects of second causes.

Among the other religious societies established in Japan, we shall only mention that of the Blind; which form a very singular, as well as a very ancient and numerous body, composed of persons of all ranks. Originally these formed but one society; but at last they were divided into the Blind Busetz, and the Blind Fekies. The Blind Busetz owe their origin to Senmimar, one of the younger sons of the emperor Jengion. He was a youth of incomparable beauty, and admired by all that approached him. He particularly captivated the heart of a princess of the royal blood, whose beauty and virtues proved as irresistible charms to the young prince, as his graceful person and princely qualities had been to her. The happy lovers had for some time enjoyed all the felicity that arises from a mutual passion, when the death of the fair princess deprived him of all comfort, and soon, through excess of grief, he lost his sight. Upon this, to perpetuate her memory, and to make known to posterity the unhappy effect of his unfeigned sorrow for her loss, he, with his father's consent, erected a society, into which none were admitted but those who were blind by birth or accident. This society flourished exceedingly, and became in great reputation not only at court, but throughout the empire. For some centuries they continued united in one body, till the Blind Fekies springing up, and many of the great men of the empire, who had lost their sight, voluntarily entering into it, the former were reduced, and confined to ecclesiastical persons.

The Blind Fekies owe their origin to the civil wars between two powerful factions, the Fekies and Gendzies, who long contended for the empire. The cause of Feki, and his adherents, at length appearing more just to the reigning dairi than that of Gendzi, he resolved to support it; which he did so effectually, that Gendzi, and his party, were defeated and almost destroyed. But as success is often followed by pride and insolence, the victorious Feki, forgetting the obligations he lay under to the dairi, treated him with such insolence and ingratitude, that he resolved to espouse the interest of Gendzi and his adherents, to whom he promised his assistance, if they would again assemble and take arms against Feki. Upon this affairs soon took another turn, and victory, in a decisive battle, declared for Gendzi, and Feki himself was slain. Among those who escaped with their lives was Kakekigo, a general famed for his valour and amazing strength, who fled in a small boat. Jeritomo, general of the Gendzies, and a very resolute soldier, was sensible of the consequence of securing the person of Kakekigo, without which he thought his victory incomplete, and therefore caused him to be pursued and taken. On his being brought before him, he treated him with all the respect due to his rank and character, and gave him such liberty that he several times escaped, but was as often retaken. Though he was his enemy and prisoner, Jeritomo was so far from putting him to death, that he generously resolved to purchase his friendship and affection at any price. But one day, when he was earnestly pressing him to enter into his service upon any terms he pleased, the captive general boldly replied, "I was once a faithful servant to a kind master, and now he is dead, no other shall boast of my faith and friendship. Thou, I own, hast laid me under great obligations, and to thy clemency I owe even my life. Yet such is my misfortune, that I cannot fix these eyes on thee, without resolving to revenge him by taking off thine head. These therefore, these prompters to mischief I will offer to thee, as the only acknowledgment of thy generous behaviour."

"my

"my unhappy condition will allow me to give thee." This said, with an undaunted courage, equal to that of the brave Roman, who, in the sight of Porfenna, burnt his right hand on the altar, he plucked out both his eyes, and on a plate presented them to Jeritomo, who, astonished at such magnanimity and amazing resolution, gave him his liberty; upon which he retired into the province of Finga, where he learned to play upon the *bywa*, a musical instrument used in Japan, and founded this society of the Blind Feki, of which he himself was the head. They are since grown very numerous, and are composed of people of all ranks: but none of them live upon charity; all applying, according to their several capacities, to different professions not entirely inconsistent with their unhappy situation. Many of them are musicians, and employed at the courts of princes and great men, and also in public solemnities, processions, festivals, and weddings. They are dispersed through the empire; but their general resides at Miaco, and has a pension from the daira. He is assisted by ten council; who also reside in the same city; of this council he is the eldest, and all of them have the power of life and death, with this restriction, that no person can be executed unless the sentence be signed by the principal judge of Miaco. This council appoint their inferior officers, who reside each in his province, and are there what the general is with respect to the whole society: and these also have officers under them.

II. The Budso, or foreign pagan-worship, introduced into Japan, probably owes its origin to Budha, whom the Brahmins of India believe to be Wishtnu, their deity, who, they say, made his ninth appearance in the world under the form of a man of that name. The Chinese and Japanese call him Buds and Siaka, which names indeed at length became a common epithet for all gods and idols in general brought from foreign countries, and sometimes they were given to the pretended saints who preached these new doctrines.

The most essential points of this religion are, that the souls of men and animals are immortal, and both of the same substance, differing only according to the bodies in which they are placed; and that after the souls of mankind have left their bodies, they shall be rewarded or punished according to their behaviour in this life, by being introduced to a state of happiness or misery. This state of happiness they call a place of eternal pleasures; and say, that as the gods differ in their nature, and the souls of men in virtue, so also do the degrees of pleasure in the state of bliss, in order that every one may be rewarded as he deserves: yet the whole place is so thoroughly filled with felicity, that each happy inhabitant thinks his portion best, and is so far from envying the superior happiness of others, that he wishes only for ever to enjoy his own. Their god Amida is the sovereign commander of these blissful regions, and is considered as the patron and protector of human souls; but more particularly as the god and father of those who are happily removed to a state of felicity. These maintain, that leading a virtuous life, and doing nothing contrary to the five commandments, is the only way to become agreeable to Amida, and to render themselves worthy of eternal happiness.

On the other hand, all persons, whether priests or laymen, who, by their sinful lives, and vicious actions, have rendered themselves unworthy of the pleasures prepared for the virtuous, are, after death, sent to a place of misery, there to be confined and tormented during a certain undetermined time, where every one is to be punished according to the nature and number of his crimes, the number of years he lived upon earth, his station there, and his opportunities for being good and virtuous. To Jemma, who is the severe judge of this place of misery, the vicious actions of mankind appear with all their aggravating circumstances, by means of a large mirror, called the mirror of knowledge, which is placed before him. Yet the miseries of the unhappy souls confined to these gloomy prisons, they imagine, may be greatly alleviated by the good actions and virtuous life of their family, their friends, and relations, whom they left behind; but nothing, they are taught, is so conducive to this desirable end, as the prayers and offerings of the priests to the great and good Amida, who can prevail on the almost inexorable judge to treat the imprisoned souls with somewhat less severity than their crimes deserve, and at last to send them as soon as possible into the world again.

For when they have been confined in these infernal prisons a time sufficient to expiate their crimes, they are sentenced by Jemma to return to this earth, and animate those creatures whose nature is most nearly allied to their former sinful inclinations; as for instance, toads, serpents, insects, four-footed beasts, birds, and fishes. From the vilest of these transmigrating into others and nobler, they at last are suffered again to enter human bodies, and thus have it in their power, either by their virtue and piety, to obtain an uninterrupted state of felicity; or, by a new course of vices, once more to expose themselves to all the miseries of confinement in a place of torment, succeeded by a new unhappy transmigration.

The five commandments of the law of Buds, or Siaka, which are the standing rule of the life and behaviour of all his faithful followers, are, 1. Not to kill any thing that has life. 2. Not to steal. 3. Not to commit fornication. 4. To avoid lies, and all falsehood: and 5. Not to drink strong liquors; which last Siaka most earnestly recommended to his disciples.

Besides these chief and general commandments, there are ten counsels or admonitions, which are only these five laws branched out, and applied to more particular actions, all tending to a stricter observance of virtue. A still farther sub-division hath been made of these laws into five hundred counsels and admonitions, in which are specified, with the utmost exactness, whatever, according to their notions, has the least tendency to virtue and vice. But the number of these admonitions being so very great, it is no wonder that those who are willing to observe them are very few; the rather as they tend to such a thorough mortification of their bodies, as to measure and prescribe the minutest part of their diet, and scarcely allow them the food necessary to keep them from starving. Nothing but the ardent desire of obtaining a most sublime state of happiness in the next world, or the ambition of acquiring a great reputation for sanctity in this, can enable any man to undergo such a rude and severe discipline. And indeed there seems very few, even of the bonzes or priests, who would willingly renounce the least of the luxuries and pleasures of this world for the sake of enjoying a greater portion of happiness in the next.

Of the followers of Siaka there are several sects, all of which have their temples, their convents, and their priests: and of all their religious buildings in the country these temples, with their adjoining convents, are the most remarkable, as being far superior to all others, from their stately height, curious roofs, and numberless ornaments, which agreeably surprise the beholder; such as are built within cities or villages commonly stand on a rising-ground, and in the most conspicuous places. They are all most agreeably situated: a fine view of the adjacent country, with the neighbourhood of a wood, a clear rivulet, and pleasant walks, being necessary to the places on which these temples are built: for with such situations, they say, the gods are delighted, and the priests readily condescend to be of the same opinion, they being most proper for their own pleasure and diversion. Beautiful stair-cases of stone lead up to these structures, and several small temples, or chapels, are built within the same court, adorned with gilt images, lackered columns, gates, and pillars, all very neat, but pretty rather than magnificent. Both the principal temple, and those smaller ones that are dependant on it, are built of the best cedars and firs; and in the midst of the large temple stands a fine altar with one or more gilt idols upon it, and a beautiful candlestick with sweet-scented candles burning before it. These temples are frequently supported by a great number of pillars, and are so neatly adorned, that a man might fancy himself transported into a Romish church, did not the monstrous shape of the idols prove the contrary. One of these temples erected at Miaco, is esteemed the most sumptuous in the empire. It is built with free-stone; the roof is bold and lofty. It stands on the top of a hill, and on each side of the ascent are lofty pillars of free-stone, ten paces from each other; and on the top of each a large lanthorn, which makes a fine shew by night. The temple itself is supported by a great number of pillars, and furnished with many idols, among which is one of gilt copper, of a prodigious size, seated in a chair eighty feet broad, and seventy feet in height. No less than fifteen men may stand on the head of this colossus, whose thumb is fourteen inches in circumference, and the body and members of this monstrous

figure

figure in proportion. But indeed the whole country swarms with idols, which are to be found not only in their temples, but in their public and private buildings, in their streets, markets, and even along the highways. People are, however, not obliged to fall down before them, or to pay them any other respect than they choose.

III. The religion of the philosophers and moralists is very different from that of the two former; for they pay no regard to any of the forms of worship practised in the country. The supreme good, say they, consists in that pleasure and delight that arises from the steady practice of virtue, and alledge that we are obliged to be virtuous because nature has endowed us with reason, that by living according to its dictates, we might shew our superiority to the irrational inhabitants of the earth. They do not admit of transmigration of souls, but believe that there is an universal soul diffused through all nature, which animates all things, and which re-assumes the departed souls, as the sea does the rivers. This universal spirit they confound with the Supreme Being. These philosophers not only admit of self-murder, but consider it as an heroic and commendable action, and the only honourable means of avoiding a shameful death, or of preventing their falling into the hands of a victorious enemy.

They conform to the general custom of the country in celebrating the memory of their deceased parents and relations, by putting all sorts of provisions, both raw and dressed, on a table made for that purpose, and by monthly or anniversary dinners, to which are invited the family and friends of the deceased, who all appear in their best clothes, and wash and clean themselves by way of preparation, for three days before, during which they abstain from lying with their wives, and from every thing esteemed impure.

They celebrate no other festivals, nor pay any respect to the gods of the country. Being formerly suspected of favouring the Christian religion, they are obliged to have each an idol, or at least the name of one put up in a conspicuous and honourable place in their houses, with a flower-pot and censer before them; but in their public schools is hung up the picture of Confucius. This sect was formerly very numerous. Arts and sciences were cultivated among them, and the best part of the nation were of that profession; but the dreadful persecution of the Christians greatly weakened it, and it has lost ground ever since: the extreme rigour of the imperial edicts make people cautious even of reading their books, which were formerly the delight and admiration of the nation, and held in as great esteem as the writings of Plato and Socrates are in Europe.

S E C T. VIII.

A concise History of the Dutch Factory at Japan. A Description of the Isle of Desima, to which they are confined: the Manner in which they are treated by the Japanese, and the Articles of their Commerce.

THE Dutch, allured by the advantageous trade of the Portuguese, first landed in Japan about the year 1602, where they met with all possible opposition, and every ill office, from their European rival in commerce. Portugal was then subject to the king of Spain, with whom the Dutch were at war; and this war was re-kindled before the Dutch discovered the designs of the Portuguese against the government of Japan, and when they assisted the Japanese, as hath been already mentioned, in driving out their invidious rivals, and afterwards in extirpating the Romish religion out of that empire. After these events, which, however unchristian, shewed them to be the friends, or at least the tools, of the Japanese, they enjoyed considerable privileges; till having built a factory and ware-house of hewn-stone, stronger, more lofty, and handsomer than the buildings of that country: while they were unlading one of their ships into their new-built ware-house, it is said, the bottom of a large box burst out, and, instead of merchants goods, appeared a brass mortar. The Japanese court were now alarmed, and the Dutch received immediate orders, under pain of death, to demolish all their buildings, and remove from the port of Firando, where they were then situated, to the little island Desima; which may properly enough be called the Dutch prison in Japan.

This island, which is situated almost close to the city of Nagasaki, has been raised from the bottom of the sea, which is there rocky, sandy, and dry at low water. The foundation, for about two fathoms, is of free-stone, and the land rises about half a fathom above high-water mark. It is joined to the town by a small stone bridge, at the end of which is a strong guard-house, where soldiers are constantly upon duty. On the north side of the island are two strong gates, which they call water-gates, as they are never opened but for lading and unlading the Dutch ships. The whole island, which is 236 paces long, and 80 broad, is inclosed with pretty high deal boards, covered with a small roof, on the top of which is planted a double row of pikes, a very trifling defence against an enemy. A few paces from the island are thirteen very high posts, placed in the water at proper distances, with small wooden tables at the top, upon which are written, in large Japanese characters, an order from the governors, strictly forbidding all vessels to approach the island. A broad street, with houses on both sides, runs across the whole island, which, as well as the island itself, were built by some of the inhabitants of Nagasaki, to whose heirs the Dutch pay a rent much above their value: all these houses are built of wood, two stories high, the lowermost of which serve instead of ware-houses, and in the uppermost the Dutch reside. The other buildings within the town are, a house built with square stone, in which are put up the imperial mandates, and the orders of the governors; three guard-houses, one at each end, and one in the middle of the island; and a place where the instruments are kept for extinguishing fires. Behind the great street the company have caused to be erected, at their own expence, a convenient house for the sale of their goods, and two ware-houses strong enough to hold out against fire; a large kitchen, a house for the deputies of the governors who are appointed to direct and regulate the trade, and a bagnio: they have also made a kitchen and pleasure-garden, and some private gardens.

Within the small compass of this island the Dutch are confined and guarded. Their ships which annually put into the harbour, after being thoroughly visited by the Japanese, have leave to land their men upon it, to refresh them there, while they stay in the harbour, which is commonly two or three months. On their setting sail the Dutch resident, with seven or eight men, or more, if he thinks proper, remain in the island; where, for fear of their smuggling, the Japanese not only take an exact inventory of all their goods and commodities, but lock them up under their own locks and seals. Even the cloths and stuffs brought over for their own use, must be delivered into the custody of the ottona, till one of their own taylors cuts them out, allowing each as much as will make him a good suit.

After the departure of the ships, the Dutch resident sets out with a numerous retinue to pay his respects to the emperor, and make the usual annual presents; but they are attended with a train of guards and inspectors, as if they were the professed enemies of the empire. The resident and his companions appear before the emperor crawling on their hands and knees, and as they approach bow their heads to the floor, and then crawl backwards like so many crabs. They are sometimes ordered to rise and dance for the diversion of the ladies of the court, and others, who are concealed by the screens; and also to sing, to laugh, to converse, to scold, &c. to which they readily submit: such influence has the love of gold, as to make them pay an abject and servile obedience to all these ridiculous commands. However, in other respects, they are treated and entertained by the emperor and his court in a very obliging manner; and at their departure presented with silk gloves, in return for their presents to the emperor and great officers of state.

Upon a few other occasions they are also suffered to leave the island; but they can never do it without a numerous retinue of those who are to watch their conduct; with this mortifying circumstance, that they are obliged, at a great expence, to pay those who lead them about as prisoners.

The Dutch ships are expected in September, towards the latter end of the south-west monsoon, which alone is proper for this navigation. The spy-guards, placed on the tops of the neighbouring mountains, no sooner discover with their glasses one of their ships steering towards the harbour, than they

they send notice of her approach to the governors of Nagasaki, when three persons of the factory are sent with the usual attendants to meet her about two miles without the harbour, to deliver to the captain the necessary instructions from the resident, or director of trade, with regard to his behaviour; and at the same time the interpreter and governor's deputies demand a list of the cargo and crew, with the letters on board; which list being carried to Nagasaki, are first examined by the governor, and then delivered to the director. The ship follows as soon as possible, and having saluted every imperial guard, casts anchor at about a musket-shot from the island. Two guard-boats immediately board her, and mount guard; while a number of officers also coming on board, demand all the guns, cutlasses, swords, and powder, which are taken away, and kept in a store-house built for that purpose, till their departure: but they do not now, as they did formerly, take away the rudder of the ship. The next day the commissioners of the governors, with their attendants of subordinate officers, interpreters, and soldiers, enter the ship, and take an exact view of all the people who belong to the Dutch on board, according to the list that had been given them, in which is set down every one's name, age, place of residence, and office. The same rules are observed with respect to the rest of the ships, two, three, or four of which are annually sent from Batavia to Japan.

It has been confidently asserted, that the Dutch here deny their being Christians; and that, as a proof of their not being of that religion, they, on their first landing, trample a crucifix under their feet: but Mr. Kämpfer asserts, that this is an unjust calumny, and maintains that they freely own their being Christians; but justly maintain, that their sentiments are very different from those of the Portuguese.

The time for unloading the ship being arrived, the water-gates of the island are opened in the presence of the commissioners appointed by the governors and their retinue, while every corner of the vessel is crowded with Japanese officers, to see that nothing be taken away privately. The goods are brought from the ships in small boats, and placed before the commissioners, who set them down in writing, compare them with the lists that have been given them, and open a bale or two of each sort, and then order them to be locked up in the company's ware-houses, till the time of sale. The chests of private persons are also examined; and if the owner does not immediately appear with the key, they, without ceremony, open them with axes. No European, or any other foreign money, nor any thing that has the figure of a cross, a saint, or beads, would be suffered to pass: for if any thing like these should be found, it would occasion a confusion and affright among the Japanese, as if the whole empire was betrayed. Hence it is customary for the captain of every ship, upon drawing near the harbour, to oblige all on board to deliver their money, prayer-books and other books of divinity to him, that he may pack them up in an old cask, concealed from the natives.

All who want to go on board, whether for his own private business, or in the company's, are obliged to take out a pass-board from the commissioners at the water-gates, to those in the ship; and when any one returns, he must take

another from these last: by which means they always know how many people there are on board, or on shore. A pass-board is a piece of wood, on one side of which is some writing, and on the other a stamp made by a hot iron.

Before the commissioners in the ship return at night with their retinue to Nagasaki, the cabin is sealed up in their presence, and all the Dutchmen carefully counted over to see that none be wanting, which would occasion great confusion. Once a sailor fell over-board in the night unobserved, and at the review the next morning he was missed. Suddenly all proceedings were stopped, and the fear lest it should be a Romish priest, who had made his escape into the country, filled the Japanese with such consternation, that all the officers ran about, and behaved as if they had lost their senses; and some of the soldiers in the guard-ships, which always encompass those of the Dutch, were already preparing to rip open their bellies, to prevent their being compelled, by an ignominious death, to atone for their carelessness; when the unhappy fellow's body being found in the sea, put an end to their fears and farther enquiries.

Whenever they are either loading or unloading the ships the water-gates are shut, by which means all communication is cut off between those who stay on board, and those that remain on shore. The whole cargo of the ships being deposited in the ware-houses, the goods are disposed of in two or three days sale; and what remains unsold is kept in the ware-houses till the next year's sale.

The Dutch send to Japan raw silk from China, Tonquin, Bengal, and Persia; wove silks and other stuffs (provided they are not wrought with gold or silver) from the abovementioned and some other countries; woollen cloth and stuffs from Europe, among which are English serges; brasil-wood, buffalo and deer skins, ray skins, wax, and buffalo horns, from Siam and Cambodia; cordowans and tanned hides from Persia and Bengal; pepper, powdered sugar, sugar-candy, cloves, and nutmegs, from Amboyna and Banda; white sandal from Timor; camphire from Borneo and Sumatra; quicksilver, saffron, and cinnabar, from Bengal; lead, salt-petre, borax, and alum, from Siam and Bengal; musk from Tonquin; gum-lacca from Siam; coral, amber, antimony, which they use in colouring their porcelain, and looking-glasses, from Europe: the looking-glasses they break, and make of them perspective-glasses, spectacle and magnifying-glasses; pickled mangoes and other pickled fruit, black lead and red pencils, sublimate mercury, files, needles, spectacles, large drinking-glasses of the finest sort, counterfeit corals, strange birds, and other foreign curiosities both natural and artificial.

In return, the Dutch bring from Japan a very great quantity of refined copper, some of a coarser sort, Japanese camphire, some hundred chests of china-ware; all sorts of japanned cabinets, boxes, chests of drawers, and the like, the best that can be procured; umbrellas, screens, and hanging-paper; rice, tea, pickled fruits, marmalades, and a great deal of gold in specie.

The Dutch once made vast profits by this trade; but the government has so lowered the prices of their goods, and added to those of their own, that they do not now gain above one-third of what they did formerly.

C H A P. II.

Of C H I N A.

S E C T. I.

Its Names, Situation, Extent, and Divisions. Its Climates, Soil, and a general View of the Country, with respect to the Fertility and Appearance of the Plains and Mountains; of their Metals and other Minerals; the Springs, Rivers, Lakes, and Canals.

THE empire of China is called by the Chinese themselves Tchong-koué, and by the inhabitants of Indostan it is termed Catay: whence it is difficult to discover the reason of its obtaining the names given to it in Europe, except they were derived from Tsin, the first emperor, who extended his conquests towards the west; whence, perhaps, the Germans call it Tschina; the French, Chine; the Italians, Cina; and the English and Spaniards, China.

This great empire is situated on the eastern borders of the continent of Asia, and is bounded on the north by the celebrated wall, and in some parts by inaccessible mountains, which separate it from Chinese Tartary; on the east it is bounded by the Yellow Sea, which separates it from the peninsula of Corea, and by the vast Western Ocean, which lies between it and America; on the south by the Chinese Sea and the kingdom of Tonquin; and on the west by Tibet, from which it is separated by high mountains and sandy deserts. It is included between 21 and 42 degrees of north latitude, and between 98 and 123 degrees of east longitude from London; and is about 1450 miles in length, and 1260 in breadth.

Some modern authors, whose names we forbear to mention, have very injudiciously extended China as far as the utmost limits of Chinese Tartary, and placed the northern boundaries of that empire in 55 degrees of north latitude, that is above three degrees more to the north than London; but nothing can be more absurd, than thus to confound countries which are essentially and in every respect different; for the wild uncultivated deserts of Tartary can never be properly termed China; nor China's fertile plains, crowded with inhabitants and rich in agriculture, ever be justly denominated Tartary.

China is divided into sixteen very large provinces, fifteen of which are within the great wall, and one without. Of these provinces Chang-tong or Xantum, Kiang-nan or Nanking, Tche-kiang, and Fo-kien, are situated on the coasts of the Yellow Sea and the Eastern Ocean; Petcheli or Pekin, Chanfi or Kanfi, and Chenfi or Kenfi, extend along the side of the great wall that separates it from Tartary on the north; Se-tchuen or Suchuen, and Yun-nan or Yunan, are on the borders of the west and a part of the south; and Quang-si or Quamsi, and Quang-tong or Canton, are on the remainder of the southern coast; while Honan, Hou-quang or Huquang, Koci-tchou or Quechue, and Kiang-si or Kiamfi, are situated in the midst, and surrounded by the other eleven: but Laotong, which is without the wall, is situated on the most northern coast of the Yellow Sea.

These are the proper bounds of the empire of China, without mentioning a great part of Tartary, which is subject to the emperor, and much increases his power; for the Tartars are brave; and tho' the country be full of woods and sandy deserts, yet it produces fine horses and furs, which are of great use to the Chinese.

We have omitted the isles of Haynan and Formosa, half of which belong to China, with Macao, and some other small islands. As to the peninsula of Corea, which lies to the north-east near Japan, and the kingdoms of Tonquin and Siam, which are seated to the south-west, they some time ago were so far dependent on China as to pay tribute to that crown, and their kings at their admission, confirmed by its emperor.

As this country extends about twenty degrees from north to south, it enjoys very different climates; for the south, which lies under the tropic of Cancer, is in summer very hot, and has its periodical rains, like other countries under the same parallel. The middle of China enjoys a temperate

climate and a serene sky; but the north is very cold, not so much from its situation, it extending no farther than the 42d degree, but from the height of the neighbouring mountains, which are commonly covered with snow, and have such an effect on the air, that the rivers in the north of China generally continue frozen from the middle of November to the middle of March.

The soil of China is also different, according as it is situated more or less to the south; yet no parts of the country can be properly said to be barren; for some are naturally fruitful, while others owe their fertility to the indefatigable labour of the husbandman. The land, like all others, is divided into hills and plains; the latter of which appear so perfectly level, that one would imagine, says Le Compte, that the Chinese, ever since the foundation of their monarchy, had been solely employed in levelling and forming them into gardens. Their manner of meliorating the ground is by letting water through it; and this is the only method by which it could be distributed equally, that those parts which lay high might not suffer by drought, and the rest be rendered useless by being continually overflowed. This is also the way by which they give fertility to their hills and many of their mountains; for they cut their sides into long and level plains, rising above each other like stairs, quite up to the summit, that the rain spreading equally, may be retained on these terraces, and not wash down the ground with its seeds. Thus have they forced or rather improved Nature, by forming artificial plains where she had raised mountains; and it must be confessed, adds the same pleasing author, that a long series of such hills and mountains, adorned with a hundred such terraces, that lose in breadth what they gain in height, and whose soil is as fertile as that of the best cultivated valleys, must afford very delightful landscapes. The terraces are however more easily formed than they could be among us, as their hills and mountains are generally less stony than ours, and their mould being light is easily cut and removed; and yet, in most provinces, it is so deep that a man may dig three or four hundred feet in depth before he comes to the rock.

Nature has not, however, been every where equal in the distribution of her favours; for she has been less lavish of them in the western and southern provinces: yet their mountains bear all the tall and straight trees that are fit for building, and these the inhabitants, by means of the rivers and canals, sell to the most distant provinces.

They have other mountains which produce iron, quick silver, copper, silver, and even gold. But Du Halde observes, that those of gold and silver have been hitherto neglected out of policy, because the public repose would be disturbed by too much riches which would render the people proud and negligent of agriculture; but that silver mines have been always kept open in the province of Yun-nan, and that the inhabitants find gold in the sands of the brooks and rivers.

But the most singular metal is white copper, of which several experiments have been made at Pekin, to try if it owes its whiteness to any mixture: but it was found that it did not, and that all mixtures, except of silver, diminish its beauty; but what detracts from its value is, its being more brittle than other copper.

They have also great quantities of pit-coal, which, as wood for firing is in general very scarce, they use for fuel on all occasions.

The mountains likewise produce loadstones, cinnabar, vitriol and alum. Lapis lazuli is found in several places, and also a kind of jasper. The finest rock-crystal is got in the province of Fo-kien; and the artificers who live near the mountains where it is produced, are skilful in cutting, engraving upon it, and making it into seals, buttons, the figures of animals, and the like.

The mountains of this province have also porphyry, and quarries of fine marble of various sorts, which if well polished, would equal the best in Europe; but little use is made of it in their public buildings; for there is neither

neither palace, temple, nor any other edifice in the whole empire entirely of marble.

As to springs, it were to be wished that they were more and better. The common water is not good, which, Le Comte observes, hath perhaps obliged the inhabitants, especially those of the southern provinces, to drink it warm; but because warm water is unpalatable and nauseous, they bethought themselves of putting some leaves of a tree to it, to render it more pleasant; those of tea, he adds, seemed to be the best, and so they frequently make use of it.

Among the springs there are said to be several which ebb and flow as regular as the sea.

If the inhabitants chance to discover a spring, it is surprising to see how carefully they husband it. They retain it within banks, and turn it here and there an hundred different ways, that all the country may reap the benefit of it: they divide it by drawing it by degrees, according as every one has occasion for it; so that a small rivulet, well managed, sometimes gives fertility to a whole province.

The rivers of China are pretty numerous: the most considerable of these is the Kiam, which rises in the province of Yun-nan, crosses three other provinces, and having run a winding course of 1200 miles, discharges itself into the Eastern Ocean. The inhabitants have a proverb, that "The sea has no bounds, and the Kiam no bottom;" and indeed in some places there is none to be found. At Nanking, where it is thirty leagues from the sea, it is a mile and a half broad. The passage along it is extremely dangerous, and many ships are lost. In its course, which is exceeding rapid, it forms a multitude of islands, that are of great benefit, as the bulrushes, which are ten or twelve feet high, serve the neighbouring cities for fuel; and from them the emperor draws a considerable revenue. It is sometimes so swelled, and its rapidity so much increased by torrents which fall from the mountains, that the stream carries some of the islands along with it, and greatly lessens others, forming new ones in other places; so that it is surprising to see them change their situation, as if they had passed under water from one place to another; but this does not always happen. However, they make such considerable changes, that the mandarines cause them to be measured every three years, in order to augment or diminish the duties, according to the condition in which they are found.

Another is called the Yellow River, because the earth it sweeps away with it, especially in times of great rains, gives it that colour. It rises at the extremity of the mountains that bound the province of Se-tchuen in the west: from thence it throws itself into Tartary, where it flows for some time on the outside of the great wall, and re-enters China between the provinces of Chanfi and Chenfi. After that it waters the province of Honan, and then running across one part of the province of Nanking, after having flowed above 600 leagues, it discharges itself into the Eastern Ocean, not far from the mouth of the Kiam. This river has formerly caused great desolation in China, and they are still obliged in certain places to confine the waters by long banks of great strength. It is very broad and rapid, but of no extraordinary depth.

Besides these, there are abundance of others, that are less famous, but more commodious for trade and commerce. There are also many lakes, some of which are of considerable extent, and afford a great variety of fish.

Though China were not naturally fruitful, the canals that are cut through it are alone sufficient to make it so. But, besides their great use in that respect, and in the way of trade, they add much to its beauty. They have generally a clear, deep, and running water, which glides so softly that it can be scarcely perceived to move. There is usually one in every province which serves instead of a road, and runs between two banks built with flat coarse marble, the stones fastened into each other in the same manner as our strong wooden boxes are fastened at the corners. Besides these caufeways, they have many bridges for the convenience of forming a communication with the opposite shores, some of three, some of five, and some of seven arches, the middlemost of which is always of an extraordinary height, that the boats may go through without lowering their masts. These arches are formed with large pieces of stone or marble, and the piers are so small, that at a distance they seem to hang in the air. These are frequently seen; and,

as the canals are generally straight, they appear at once stately and agreeable: but we shall give a more particular account of the bridges of China in treating on their architecture.

Each of these great canals runs into smaller ones on each side, which are again subdivided into small rivulets that end at some great town or village, or else discharge themselves into some lake that waters the adjacent country. Indeed, these clear and plentiful streams, covered with numberless boats and barges, embellished by fine bridges, bounded by such neat and convenient banks, and equally distributed through fertile plains of vast extent, render the fields the most fruitful and beautiful upon earth.

The Chinese say, that their country was once entirely overflowed, and that they drained off the water by cutting their useful canals. Supposing this to be true, we cannot sufficiently admire their boldness and industry, who thus formed artificial rivers, and of a kind of sea in a manner created those fruitful plains. But it appears incredible, that men so ignorant of the principles of physics, and the art of levelling, could bring such a noble work to perfection. Yet it is certain, that these canals are not natural: for they are generally straight, the distribution is performed with great equality; flood-gates are made to let in the water from the rivers, and others to let it out when the canals are too full; so that it cannot be doubted that the Chinese owe these advantages to their own industry.

S E C T. II.

Of the Trees, Shrubs, Plants, Flowers, and medicinal Roots; together with the four-footed Beasts, Birds, Insects, Reptiles, and Fishes of China.

THE soil is proper for all sorts of fruit; for it produces pears, apples, apricots, peaches, figs, grapes of all kinds, and especially excellent muscadines. There are also pomegranates, walnuts, chestnuts, and in general all that we have in Europe: but most of these fruits are not near so good as ours, they being wholly strangers to the art of grafting, and our manner of cultivating fruit-trees. Besides, they want a variety of each distinct sort; for they have but three or four kinds of apples, seven or eight of pears, as many of peaches, and none of cherries but what are very indifferent.

But what makes them sufficient amends for this defect is, their having several excellent fruits to which we are strangers, particularly one which they call tse-tse, which grows on a wide spreading tree as tall as a middle-sized walnut-tree. The leaves are large, and of a lively green, but change in autumn to an agreeable red. The fruit is about the bigness of a handsome apple, and their colour, when ripe, is a bright yellow. When dry, they have some resemblance to a fig.

In the southern provinces are other fruits that are still more esteemed by the natives. They have an excellent fruit called litchi, which is of about the size of a date: the stone is long, hard, and covered with a soft pulp full of moisture, and of a delicious taste. Over all is a rough thin skin: it is shaped like an egg; but when dried, it loses much of its fine flavour, and becomes black and wrinkled like prunes. The Chinese, however, preserve it by drying, and eat it all the year round.

The longyen, or dragon's-eye, is exactly round, and grows on a tree as large as those that produce walnuts. The rhind is smooth and grey, but as it ripens it turns yellowish; the pulp is white, moist, and inclining to the acid. This is not quite so agreeable as the former, but it is more wholesome, and never occasions any disorder.

The seze is another kind of fruit thought peculiar to China. It grows in almost all parts of that empire, and is of several kinds. Those in the southern provinces taste much like sugar, and melt in the mouth; their rhind is clear, smooth, transparent, and of a shining red, especially when the fruit is ripe. Some are of the shape of an egg, but they are usually bigger; the seeds are black and flat, and the pulp being almost liquid, people suck it out at one of the ends. When they are dried like our figs, they become mealy; but in time there grows a sort of sugared crust upon them, from which they receive a most delicious flavour.

Those

Those that grow in the provinces of Chanfi and Chenfi are more firm, bigger, and may more easily be preserved.

From China we have only one kind of orange cultivated in Europe; but they have several that are excellent, especially one sort which is in great esteem; they are small, and the rind is thin, smooth, and very soft. Another kind produced in the province of Fo-kien has an admirable taste; these oranges are large, and the rind is of a beautiful red. Those they have at Canton are still larger, more yellow, very agreeable to the taste, and extremely wholesome. They consider the juice of these oranges as a great pectoral, and give them to the sick, after they have been roasted in hot embers, cut in two, and filled with sugar.

We shall omit the ananas, goyavas, cocoas, and other fruits that are not natives of China, and for which they are indebted to the Indies.

One of the most remarkable of their trees is that which produces pease; for the shape, colour, shell, and taste, are extremely like those of our pease. This tree is common in several provinces, and is inferior to very few in its tallness, the spreading of its branches, and the thickness of its trunk.

There are trees in the province of Quang-si which, instead of pith, have a soft pulp, of which they make flour of a pretty good taste.

Among other trees peculiar to this country is a kind of pepper-tree, the fruit of which is different from any of the sorts known to us. It is a kind of berry as big as a pea, and is of a greyish colour, with small red streaks. When the berries are ripe they open of themselves, and discover a little stone as black as jet, which casts so strong a smell, that it is offensive to the brain, for which reason they are gathered by intervals, the people not being able to stay long on the tree at a time. Having exposed these grains to the sun, they throw away the stone, which is too hot and strong, and only use the rind; which though not quite so agreeable as the pepper brought from the Indies, is good in sauces. The plant that produces it is in some places a thick bush, and in others a tree of a moderate height.

There are two kinds of the varnish-tree, both of which seem very different from the two sorts in Japan. One, called by the Chinese tsichu, is of a small size, with a whitish bark, and leaves like those of the wild cherry-tree. The gum, which distils drop by drop, is like the tears of the turpentine-tree. If an incision be made in it, it yields a much greater quantity; but this will soon destroy the tree. This varnish is a strong poison, and, though inferior to that of Japan, is much esteemed by the artificers; it takes all colours alike, and, if it be well managed, neither loses its lustre by the changes of the air, nor the age of the wood to which it is applied.

The other, called tongchu, so nearly resembles a walnut-tree, that many have been deceived by it. It bears a nut filled with a very soft pulp, that contains a thickish oil, which they squeeze out and prepare for use, by boiling it with litharge. This, as well as the other varnish, is supposed to have a poisonous quality. It is often used not only where the work is painted, but to varnish wood, in order to preserve it from the bad effects of rain, and to give a lustre to the floors of the emperor's apartments and those of the grandees.

Another remarkable tree is the kouchu, which resembles the fig-tree of Europe, both with respect to the wood, the branches, the leaves, and the bark: only the leaves are larger, thicker, and rougher on the upper side, and on the under side are covered with a fine down. This tree yields a milk made use of by the Chinese for size, in gilding with leaf gold. To obtain it, they make one or more horizontal incisions in the trunk, and into the edge of the slits put the edge of a sea-shell, or some other receiver that will answer the same purpose, into which the milk distills; and when they use it they dip a pencil in it, and draw what figure they please upon wood, or any thing else, on which they afterwards lay leaf gold, which it so firmly cements that the gold never comes off.

The tallow-tree is very remarkable. It is as high as a large cherry-tree; the branches are crooked; the leaves shaped like a heart, and of a lively red; the head is round and very thick, the trunk short, and the bark smooth. The fruit is inclosed within a rind divided into three

segments, which open when it is ripe, and discover three white kernels, each of the size of a small nut. This mixture of white and red appears very beautiful; and being planted in line chequerwise, the fields where they grow resemble, at a distance, a vast parterre covered with flower-pots. But what is more surprising, these kernels have all the qualities of tallow; its smell, colour, and consistence. They also make candles of it, mixing only a little oil when they melt it, to make it more pliant; but the smell of these candles is much stronger, their smoke thicker, and their light dimmer than ours: but these defects may be probably owing to the wick; for instead of cotton, of which they have great plenty, they use a small stick of a dry light wood, wrapped round with the inner part of a rush. This mixture of rush and wood cannot possibly burn so clear as cotton, but must naturally increase the smoke, and cause an offensive smell.

The white-wax-tree is another of a very extraordinary nature. It is not so tall as the tallow-tree, from which it differs in the colour of the bark, which is whitish, and also in the shape of the leaves, which are longer than they are broad. What is remarkable, is, that a small kind of worm fixes itself to the leaves, and forms a sort of comb much smaller than a honey-comb, the wax of which is very hard and shining, and of far greater value than common bees-wax.

There is another tree which bears a fruit from which is drawn an excellent oil, which, when fresh, is perhaps the best in the whole empire. The tree has some distant resemblance to the tea-shrub with respect to the shape of the leaf, and the colour of the wood, but greatly exceeds it in height and thickness. The berries, which are green, and of an irregular figure, contain several kernels.

There are many trees that would appear very beautiful when properly disposed in gardens: for instead of fruit, they are almost all the year long laden with flowers of a florid carnation, the leaves are small like those of the elm, the trunk irregular, the branches crooked, and the bark smooth.

Among others, there is one that resembles the sycomore. The leaves are between eight and nine inches in diameter, fastened to a stick a foot long. It has a round head, and is so thick set with clusters of flowers, that the rays of the sun cannot penetrate them.

The tree which produces the flowers called kuey-hoa, is very common in the southern provinces; but rarely found in the northern. The leaves resemble those of the bay-tree. The flowers are small, of various colours, and have a charming scent. There is another species proper to the maritime provinces, the flowers of which are not so agreeable to the sight, they being of a dusky yellow: but they even excel the other in their delightful fragrance.

In the province of Yun-nan are found the trees which bear the cassia fistula: they are pretty tall, and the pods no longer than those we see in Europe: these are not composed of two convex shells, like those plants of the leguminous kind; but are a sort of hollow pipes, divided into cells, that contain a soft substance, no way differing from the cassia in use with us.

We shall here forbear to treat of the banana-tree, the betel-tree, the mango-tree, the cotton-tree, and several others that also grow in most parts of the Indies.

They have most of the kinds of timber-trees that grow in Europe; but that which they most esteem is called Nannon. The ancient palaces of the emperors have the windows, gates, beams, and pillars of this wood, which the natives imagine will never decay, and consequently that whatever is formed of it will last for ever. Some have thought it a kind of cedar; but though it is very tall and straight, the leaves have no resemblance to those of that tree.

No kind of wood can exceed the beauty of the tsetam, which is of a reddish black, and full of fine veins, which seem painted. It is proper for cabinets, and the very finest sorts of joiners work; and what is made of it, is much esteemed.

The iron wood, with respect to strength and firmness, is inferior to none. The tree is as tall as a large oak; but differs from it in having a slender trunk; in the shape of the leaves; in the wood being of a darker colour; and more especially in the weight, it being too heavy to swim. The anchors of their ships of war are made of this wood, and the

the emperor's officers have the folly to pretend, that they are better than those made of iron.

Among the flowering-trees is the mo-lien, which is as thick as the small of one's leg. Its branches are slender, and covered with a red rhind with whitish spots: the leaves are few but very large, and joined to the tree by stalks, which spread so much towards the bottom that they seem to embrace the branch, and to proceed from it as out of a tube. From the bottom of these stalks proceed small buds covered with down, which opening in the depth of winter become large flowers like the mountain-lily, composed of seven or eight leaves of an oval figure, and pointed. Some of these trees bear a white flower, others red, and others yellow. The leaves fall at the same time, and often before the flowers are opened.

The lamoc resembles the bay-tree in its size, figure, and the shape of the branches, which are furnished with leaves that grow with short stalks in pairs; the leaf at the end of the branch is nearly of the size of the common laurel, and they decrease in size in proportion to their distance from the end of the branch. In the depth of winter there proceeds from the bottom of the stalks of the leaves small yellow flowers of an agreeable smell, not unlike that of the rose.

The tchakoa is also very beautiful. Of this tree, which is an ever-green, there are four kinds that bear flowers, all of which resemble the Spanish laurel with respect to the wood and leaves. At the place where the stalks of the leaves join to the branches, rise buds of the size, colour, and shape of a hazel-nut, but are covered with a fine white hair; and these buds, opening in December, produce flowers which are double, and of a reddish colour, like small roses, joined immediately to the branches without any stalks. The trees of the second kind are very high, and the flowers are large and red, which mixed with the green leaves have a very agreeable appearance. The flowers of the two other kinds are small and whitish, and the middle of them is filled with small filaments, that have each a yellow flat top as in common roses, with a round pistil in the middle.

There is another very singular tree that resembles both the juniper and cypress-trees. The trunk is about a foot and a half in circumference, and almost as soon as it rises out of the ground sends forth branches, subdivided into many others, which at some distance from the stem form a close green bush, covered with a multitude of leaves, some like those of the cypress-tree, and the rest long, narrow, and sharp, like those of the juniper, disposed along the boughs in rows of four, five, or six in number; so that looking upon these boughs at the end, they resemble stars of four, five, or six rays, exactly covering those below, so that the spaces between them appear empty and distinct to the bottom. The boughs covered with these long leaves, are found principally at the lower part of the branches; for towards the top you behold nothing but cypresses. In short, nature seems to have taken pleasure in mingling these two sorts of leaves in such a manner, that some are entirely juniper, others nothing but cypress, and some half one and half the other. The bark is a greyish brown, in some places inclining a little to the red; and the wood is a reddish white, like that of the juniper-tree, with a little spice of the turpentine. The leaves, besides the smell of the cypress-tree, are a little aromatic; but their taste is acrid and very bitter. This tree bears small green berries, a little larger than those of the juniper; joined to the branches by long stalks, like those of the leaves. Each contains two reddish seeds of the shape of an heart, and as hard as grape-stones.

There are trees of this kind that have a tall and slender trunk, with branches only at the top, ending in a point almost like the cypress; and there are others of the dwarf kind, that grow no higher than seven or eight feet. It is remarkable, that when this tree is young all the leaves are long, like those of the juniper; and that when it is old, it resembles the cypress.

Besides these they have oaks, elms, pines, cedars, ashes, palm-trees, and many others known in Europe.

To these useful trees may be added the reed or cane, commonly called a bamboo, which generally grows to the height of an ordinary tree; and, though knotty and hollow, is exceeding hard, and so strong as to support a great weight. It is therefore, in some places, used in building, also for pipes to convey water, and many other purposes. As it

will admit of being divided into small splinters, they make of it boxes, baskets, and other things: and after all, when it is broken in pieces, and grown rotten, it is boiled in water till it is reduced into a kind of paste, and then it serves to make paper of different kinds.

Among the various shrubs we shall first mention that of tea: the name of which is derived from the corrupt pronunciation of two cities in the province of Fo-kien; but in all the rest of the empire it is called tcha. The Chinese tea appears to be a different species from that of Japan, and therefore deserves a particular description. It is distinguished into three sorts: the first, called song-lo-tcha, grows on a mountain in the province of Kiung-nan, in 29 deg. 38 min. 30 sec. latitude, and is the same we call green tea. The shrub is planted in rows, and is kept pruned to prevent its growing too high. It must be planted anew every four or five years, or else the leaf becomes thick, hard, and rough. The flower, which is in the shape of a rose, is composed of five white leaves; and in autumn, when it drops off, there appears a berry in the form of a nut, that is a little moist, and has no bad taste. In other provinces, where they suffer the shrubs to rise to their full height, they reach to ten or twelve feet: therefore, when the branches are young and tender, they cause them to bend downward, in order that they may gather the leaves with the greater ease.

Another sort of tea, called vou-y, or bohea, grows in the province of Fo-kien, and takes its name from a celebrated mountain in 27 deg. 47 min. 38 sec. latitude, on which are many temples, houses, and hermitages of the Bonzes, who, in order that it may pass for the abode of superior beings, have conveyed barks, chariots, and other things of the same kind up into the clefts of the steepest rocks, along the side of a rivulet that divides it into two, and these are considered by the vulgar as prodigies; for they imagine, that none but a power more than human could convey them up to those inaccessible places.

The soil of this mountain is light, whitish, and sandy; and the only difference between the tea that grows upon it and the former is, that its leaves are shorter and more round, of a colour a little blackish, and yield a yellower tincture. As the taste is agreeable, and the decoction inoffensive to the weakest stomach, it is sought for and used in every part of the empire. Of this kind there are four sorts: the first is the tender leaf when scarcely opened. This is seldom exposed to sale, but serves to make presents of, and to send to the emperor. It is therefore called imperial tea, and is valued at about two shillings in the pound. The second consists of leaves of a sensible growth, and is esteemed a very good sort. The remaining leaves are suffered to arrive at their full growth, which makes the third kind exceeding cheap. The fourth sort is made of the flower, but those who would have it must bespeak it before-hand, and pay an excessive price for it: yet it makes a very insipid tea, that is never used at the emperor's court.

There are several other kinds of tea, little different from the two principal, except what is owing to the nature of the soil in which the shrubs are planted; there are also several plants to which they give the name of tea, though they are not at all like it. There is, however, a third principal sort, called by the Chinese pou-eul-tcha, from a village in the province of Yun-nan, near which stands the mountain on which it grows. The leaves are longer and thicker than those of the two former kinds; they roll them up, and sell them at a good price.

Many of the mountains are covered with an admirable kind of osiers of the thickness of one's finger, which creep upon the ground, and produce very long sprigs resembling twisted cord. These being extremely limber and very strong, they not only make of them baskets, hurdles, and a kind of mats on which the Chinese lie in summer, they being very cool, but also ropes and cables for ships.

Among the fruit-bearing plants they have two sorts of melons, different from ours, and that are very excellent. One of these grows in the province of Chen-si, and is small, yellow within, and of a sweet taste like sugar: these they eat with the rhind, as we do an apple. The other are a kind of water melons, and are very large and long: the inside of some of them is white, and of others red, full of a cooling juice that has also the sweetness of sugar. They

never

never prove offensive to the stomach, and may be eaten during the greatest heats of summer, without fear of a surfeit.

Among the shrubs there are but three or four kinds that bear odoriferous flowers, and among these the jessamine is the most agreeable. In the south it rises to a moderate height; but in the north it is no more than six feet high, though it be kept in a green-house all the winter. The flower resembles a double jessamine; but the leaf is different, and very like that of a young citron tree.

There is a shrub that is not odoriferous, which bears a white flower as large as a double or treble rose: it is succeeded by the fruit, which is in the shape of a peach; but it is insipid to the taste. In its cell are several seeds covered with a blackish skin.

The piones of China are more beautiful than those of Europe, and have an agreeable smell; but the rest of their garden flowers are not to be compared with ours.

The lakes, however, produce many beautiful flowers, and nothing can be more agreeable than to see the waters thus adorned, and every year improved and renewed by the seed which they sow. The great lords keep these flowers in little ponds, and sometimes place them in vessels filled with mud and water in their gardens. Among these the lienhoa, which resembles a tulip, rises two or three cubits above the surface of the water. Its colour is either violet or white, or part red and part white; and it has a very agreeable smell. It bears a fruit as big as a walnut, and the kernel which it includes is white and of a good taste. This the physicians think of a nourishing and strengthening nature, and therefore prescribe it to those who are weak. Its leaves, which are long, swim upon the water, and have a communication with the root by long strings, which are used by the gardeners to wrap up their goods. The root is much eaten, especially in summer, because it is very cooling. In short, there is nothing in this plant that is not useful; for they even make of it a kind of meal.

The cotton shrub of China is one of the most useful. The husbandmen have no sooner got in their harvest, than they sow cotton in the same fields: and then raking the earth over the seeds, there soon grows up a shrub about two feet high, the flowers of which appear by the middle of August. These are generally yellow; but sometimes red. This flower is succeeded by a small button of the bigness of a nut, which opens in three places; and, on the fortieth day after the appearance of the flower, discovers three or four wrappings of cotton extremely white, and of the same form as the cocoon of the silk-worm; this being fastened to the bottom pod, contains seeds for the following year. It is then time to get in the crop; but in fair weather they leave it to be exposed two or three days to the heat of the sun, which causing it to swell encreases the profit. As all the fibres of the cotton are strongly fastened to the seeds they inclose, the people use an engine to separate them. It contains two smooth rollers, one of wood and the other of iron, about a foot long and an inch thick, in a manner close to each other. While one hand gives motion to the first of these rollers, and the foot to the second, the other hand applies the cotton, which is drawn through while the naked seeds remain behind. Afterwards they card and spin the cotton, and weaving it, convert it into callico.

The meaner sorts of the people, who live chiefly upon vegetables, are very careful in the cultivation of their kitchen garden, and never suffer the earth to lie useless. Among those vegetables not known in Europe, there are none worthy of notice but the petfai, which is excellent. It has been thought a kind of Roman lettuce; but it resembles it in nothing but the first leaves, the height, flower, seed, and taste being entirely different. Such incredible quantities of it are sown every year, that in the months of October and November the nine gates of Peking are crowded with waggons loaded with it. They preserve it with salt, and also pickle it, and mix it with their rice to give it a relish.

In so large an empire the medicinal herbs and roots must be very numerous.

The plant named by some authors radix-xina, and by the natives fou-ling, is more used than any other by the Chinese physicians. Its leaves, which are long and narrow, creep on the ground. The root, when full grown, is very

thick. This plant bears a pod filled with a white pulp. In several parts of the country there is a wild sort of it, that is also much used, and sold at a lower price. Its good effects in several disorders are unquestionable; it is used as a kind of panacea, and prescribed in almost all distempers. The root is not so commonly used, but is much dearer. It is of a warm nature, and is esteemed an excellent remedy in all diseases arising from cold humours, and for all kinds of obstructions.

Rhubarb grows in several places in great abundance. The leaves are long, broad, and rough to the touch; the flowers resemble tufts in the shape of a bell, but are jagged at the edge; and the root, while fresh, is whitish within; but when dried, it assumes the colour it has when brought to us.

The tihong is the root of a very beautiful plant. One would take it for a sort of liquorice, with a leguminous flower and a crooked pod; but, on examining the leaves, the seed, and the taste, it is difficult to determine to what species it belongs. It is much used to remove by little and little the decays of strength.

The fanti is esteemed a most valuable remedy; and among its other virtues, is efficacious in women's disorders, and hæmorrhages of all kinds. A sort of goat, of a greyish colour, is fond of feeding upon this plant, whence the blood of this animal is thought to be possessed of the same medicinal properties.

Of all the medicinal herbs and roots, none is held in such esteem, or is sold at such a price, as that of ginseng; but as this is not one of the natural productions of China, but is chiefly imported from Tartary, we shall give a description of it in treating of that extensive country.

As for the animals, there are all the cattle found in England, though, considering the great extent of the country, the number of them is but small; there are, however, in the mountains many wild beasts, as rhinoceroses, camels, buffaloes, tygers, bears, and wild boars; but there are no lions.

One of the most remarkable animals is a kind of camel, no higher than an ordinary horse. He has two bunches on his back covered with long hair, that form a kind of saddle. The bunch before seems formed by the back-bone and the upper part of the shoulder-bone, and is not unlike the bunch which the Indian cows have on their shoulders; the other bunch is placed just before the buttocks. His legs are in proportion, not so long as those of common camels; and his neck, which is shorter and thicker, is covered with thick hair as long as that of the goat. Some of these camels are of a yellowish dun-colour; others are a little upon the red, and in some places of an ash-colour; but as their legs are not slender, like those of the other camels, they seem, for their size, more fit to carry burdens.

They have some good horses that are strong and vigorous, but they too are small; and there are also a particular kind of stags, no larger than our common dogs, which the nobility keep in their gardens for their diversion; but they have many deer of a larger size.

The musk roe-buck is another extraordinary animal. It is a kind of deer without horns, with hair of a blackish colour. The musk is generated in the inward part of a bag, composed of a very thin skin covered with hair extremely fine, and sticks round it like a kind of salt: there are two sorts of this musk, but that which is in grains is the most valuable. The female produces no musk. The flesh of snakes is said to be the common food of this animal; for though they are of an enormous size, the roe-buck easily kills them; because he no sooner approaches them, than they are so overpowered by the scent of the musk, as to be unable to stir. However, the flesh of the roe-buck is good to eat, and is served up at the best tables. This is so well known, that whenever the peasants go to cut wood, or make charcoal in the mountains, they secure themselves from being bit by the snake, by carrying about them a few grains of musk; when, if any snake approaches them, it is suddenly stupified, and unable to advance.

The black hogs of this country are excellent food, greatly superior to the pork of Europe. These are very numerous, and are much eaten by the inhabitants, who at least seem equally fond of the flesh of dogs and wild horses, which are dressed in various manners, and served up

up at the best tables. The vulgar are fond of horse and dog flesh, though these animals die with age or sickness.

As to birds, there are parrots of all sorts, exactly resembling those of America: they have the same plumage, and the same aptness to imitate the human voice; but they are not comparable in beauty to the bird called the golden hen. There is none of that species in Europe that can be compared with it. The liveliness of the red and yellow, the plume on the head, the fine shadowing of the tail, the variety of colours that appear in the wings, together with the delicacy of its shape, have no doubt given occasion to the epithet Golden conferred on this fowl. Besides, the flesh is more delicate than that of the peasant; so that on every account none of the eastern birds would be more acceptable if brought into this country.

Among the beautiful birds the haiting also deserves notice. It is very uncommon, and is only found in the province of Chen-si, and in some parts of Tartary. It is not inferior in beauty to our finest falcons, and in strength and size is much superior; whence it may justly be called the king of the birds of prey in China and Tartary.

There are in China also wild and tame peacocks, fowls of all sorts, and most of the birds found in Great Britain; together with bats of a prodigious size.

Among the flying insects, the butterflies of a mountain in the province of Quang-tong are greatly esteemed, and the largest and most uncommon among them are sent to court. Their colours are extremely vivid, and most surprisingly diversified. In the day-time they are without motion on the trees, and consequently are easily taken; but in the evening they flutter about in the same manner as our bats, and many of them seem to be almost as large. There are others of a smaller kind, much sought after; but they are by no means comparable to the former.

In a river in the province of Hou-quang are taken a great number of tortoises of different sizes, which the nobility keep in their gardens and at their pleasure-houses for their diversion.

There are no sorts of fish in Europe that are not to be met with in China; besides many others of an excellent taste quite unknown to us, a few of which we shall here mention.

One of these most esteemed is the armour-fish, so called from its being cased in a coat of hard sharp scales, placed one over another, like tiles on the roof of an house. It weighs about forty pounds, and is an admirable fish, exceeding white within, and in taste has some resemblance to veal.

One of the best fishes in China is like a sea-bream; it weighs five or six pounds, and is commonly sold for little more than a farthing a pound; and for only as much more after being carried twenty leagues up the country.

In calm weather they catch another sort of delicate fish, called by the Chinese the meal-fish, from its extraordinary whiteness. The black circles of its eyes are surrounded with two circles resembling rings of bright silver. They are found in such prodigious shoals, that there is commonly caught of them, at one drag of the net, no less than four hundred weight.

The yellow-fish caught in the great river Yang-tse-kiang is of an exquisite taste, and of a very extraordinary size; for some of them weigh 800 pounds weight. There are no fish in the world that eat more firm; but they are only caught at certain seasons.

The golden fish, which are much admired, and kept by the great men in their courts and gardens, as ornaments to their palaces, are about the length of one's finger, and proportionably thick. The male is of a beautiful red from the head half way down the body, and the remaining part seems gilt; but in such a manner, says Le Compte, that our best performances in gilding are inferior to it. It has also bright and shining spots about the gills. The female is white, and has the tail and some part of the body perfectly like silver; the tail of each is frequently not smooth and flat like those of the other fish; but often forms a kind of tuft, and adds new beauty to this pretty creature, whose whole body is finely proportioned. These fish begin now to be pretty well known in England, gentlemen keeping them in large glass vessels, where they are seen to swim about, and may be observed at leisure without the least inconvenience. They even multiply very fast here; and a person of distinction at

Wimbleton, in Surry, has actually a fish-pond well stocked with them. They are, however, very indifferent food; for nature has bestowed so many beauties on them only to charm the eye, and has consulted their safety by rendering them incapable of gratifying the taste of the luxurious.

S E C T. III.

Of the Origin, the Persons, Dress, Manners, and Customs of the Chinese.

THE origin of the Chinese empire is as obscure as the source of the Nile. The vulgar history of that monarchy is not only dubious, but evidently false, since forty thousand years are supposed to have passed since its foundation; but, according to their regular history, in which all the learned agree, China has had its kings for more than two thousand years. It seems probable, that some of the grand-children or great-grand-children of Noah dispersed themselves in Asia, and at length reached the most westerly parts of China, where they lived in the beginning in families, the kings being fathers, to whom age, an abundance of flocks, herds, and other pastoral riches, added authority. The foundation of this monarchy is said to have been laid by Fohi, whose virtue, wisdom, and power, added to his great age, induced the people to listen to him as to an oracle; and as he regulated all private, as well as political and religious affairs, the state soon became in a flourishing condition.

'Tis said, the people then principally applied themselves to the education of their children and to agriculture, for which they had an high esteem. They were extremely laborious; the judges and governors were grave and sober, and by the equity of their decisions, gained the love and respect of the people; while the prince placed his highest felicity in rendering his subjects happy, and considered himself, rather as the father of a numerous family, than as the sovereign of a great empire. Thus the Chinese acquired such reputation, that they were admired and esteemed by all the neighbouring nations; and it is probable that they considered themselves as superior to all other men; an opinion which they retained, after their having suffered as great revolutions in morals as in politics; and even became so vain as to fancy that Heaven had placed them in the center of the universe to give laws to mankind.

As to their persons, they are far from being such grotesque figures as they represent themselves in their paintings; and we may form a pretty distinct idea of them in general, by considering what they esteem beauty. This they imagine consists in having a large forehead, small eyes, a short nose, a broad face, a mouth of a moderate size, large ears, and black hair; together with a certain symmetry and proportion between all the parts. As their garments are wide, and do not sit so close to the body as those of the Europeans, they have formed no idea of the beauty resulting from a genteel and easy shape. On the contrary, they esteem a man well made when he is fat, bulky, and handsomely fills his chair. Their complexion, in the southern parts of China, where the weather is excessive hot, is of an olive colour; but, in the northern provinces, they are naturally as fair as the Europeans, and, generally speaking, their faces are not disagreeable: in particular, the men of learning and young people have a fine skin, and a beautiful complexion; but it is remarkable, that the learned, especially if they are of base extraction, affect to let the nails of their little fingers grow an inch long or more, from the vanity of shewing that they are not subject to mercenary labour.

As for the women, they are commonly of the middle size; their noses are short, their eyes little, their mouths well made, and with rosy lips; their ears are long, their hair black, and their complexion florid; their features are regular, and their countenances full of vivacity. The smallness of their feet is, in the opinion of the Chinese, none of the least charms of that sex: therefore, when a female infant is born, the nurses are very careful in binding her feet extremely hard, to prevent their growing; and they are ever after subject to this constraint: but whatever pain a child suffers from this violence offered to nature, it is

is surprising that it does not appear that their health is ever impaired by it; and such is the force of custom, that when grown up, they are so far from complaining of it, that they pride themselves in this extraordinary charin, and always affect to shew their feet as they walk, or rather hobble along with tottering and unsteady steps.

The men shave their heads, leaving only one lock of hair growing on the crown, and cover their heads in summer with a small cap, in the form of a funnel, made of rattan or cane, and lined with sattin. At the top is a tuft of hair that spreads over it to the very edges. This hair, which grows between the legs of a cow, is dyed of a bright red, and is allowed to be worn by all sorts of people. But the men of letters wear a cap of the same form made of pasteboard, and lined and covered with sattin, with a large tuft of the finest red silk. But in winter they wear a very warm sort of cap bordered with sable, ermine, or fox-skin, the upper part of which is covered with red silk, that falls round it to the edges, and as they walk flutters in the air. This border of fur is two or three inches broad, and looks very handsome. The upper part of the cap, when worn by the mandarines in their formalities, is adorned with a diamond, or some other precious stone ill cut, though set in gold.

Their other garments consist in a long vest, one lappet of which folds over the other, and reaches to the right side, where it is fastened by five or six gold or silver buttons, at a small distance from each other. The sleeves, which are broad towards the shoulders, grow narrow by degrees towards the hand. They gird themselves with a large silk sash, the end of which hangs down to their knees, and in this they put their purse, and a case that contains a knife, two small sticks which serve for a fork, and other things. Under the vest they in summer wear linen drawers, which are sometimes covered with another of taffety; but in winter they wear sattin breeches, with cotton or raw silk quilted in them: in the northern provinces they are made of warm skins. Their shirts are made of different kinds of cloth, and are very wide and short. In summer their necks are quite naked; but in winter they cover them with a neck-band of sattin or sable, or the skin of a fox; and in that season their vest is lined with sheep-skins. People of quality line them quite through with sable, or fine fox skins, with a border of sable; and in spring they have them lined with ermine. Over the vest they wear a surtout, with large short sleeves lined and bordered in the same manner.

The Chinese of a certain rank dare not appear in public without boots, even though they walk on foot, or are carried in a sedan. This custom would seem less ridiculous was it only practised in winter; for their boots being of silk, and their boot-hose of a pinked stuff lined with cotton, a full inch thick, their legs are well defended from the cold: but in summer, when the heat is excessive, none but the Chinese, merely for the sake of keeping up an air of gravity, would be able to wear them. Some indeed may perhaps wear a lighter sort; but the working people, either to avoid the inconvenience, or to save charges, scarce ever use them. These boots have neither tops nor heels. If they go a journey on horseback, they wear boots of neats or horse leather, so well dressed that nothing can be more limber; and their boot-stockings are of stuff lined with cotton; they come higher than the boots, and are bordered with plush or velvet.

When they make a visit of any consequence, they wear over the vest a long silk gown, commonly blue, girded about them, over which they have a black or violet coloured cloak that reaches to their knees. This is exceeding wide, and has very wide and short sleeves. They also wear their boots, and carry a fan in their hand. Instead of gloves, when the weather is cold, they make use of the sleeves of their vest, which, being very long, they draw their hands into them to keep them warm. If the persons they visit chance to be at home without their boots, they make them wait till they have put them on.

As they affect a starched gravity in all their ways, they have a great veneration for a long beard; they therefore let theirs grow; and if they have not much, it is not, says *Le Compte*, for want of cultivation, but nature has been very sparing to them; and there is not one among them who does not envy the Europeans, whom they consider in this respect as the greatest men in the world.

If the dress of which they are so fond appears ridiculous to us, ours does not appear less so to them; our having our beards, and, instead of our own hair, wearing a bush of artificial curls on the head, appear in the highest degree fantastical and absurd; and their ideas of gravity make them see nothing agreeable in our discovering long legs, with stockings drawn straight; and breeches that sit close to the thigh.

But tho' persons of quality observe all these formalities when they appear in public in the hottest weather, yet in private, and among their friends, they quit their bonnet, surtout, vest, shirt, and even their favourite boots, reserving nothing but a single pair of drawers of white taffety or thin linen. This is the more extraordinary, as they are offended at our painters and engravers for representing men with their arms and legs uncovered: yet in the southern provinces they shew that they have not the least degree of modesty, and almost all the artificers and inferior tradesmen go along the streets with single drawers, without cap, stockings, or shirt, which renders them much tanned and of a swarthy hue: but in the northern provinces the cold renders them, to appearance, more modest.

The Chinese ladies have no less vanity than those of other nations; for they spend several hours every morning in dressing and adorning themselves, thinking they may be seen in the day, though perhaps they are not by any one but their domestics. Their head-dress consists in several curls, interspersed with little tufts of gold and silver flowers, and sometimes is crowned with the figure of a fabulous bird made of copper or silver gilt, its extended wings embracing the upper part of the temples, and its spreading tail forming a plume on the middle of the head; while its neck, having a joint, moves with the least motion. Ladies of quality have an ornament composed of several of these birds united so as to form a kind of crown.

The young ladies, however, generally wear a sort of cap made of pasteboard covered with silk; the fore part rises in a point above the forehead; and is adorned with pearls, diamonds, and other ornaments. The upper part of the head is adorned with flowers, either natural or artificial, mixed with small bodkins, the ends of which shine with jewels. But women advanced in years, especially the common sort, are contented with a piece of silk wrapped several times round the head. The ladies, as well as the men, wear a vest, which is of sattin or cloth of gold, and over it their gowns, which are very long, cover them from head to foot; their hands are always concealed under wide sleeves, that would almost draggle on the ground were they not to hold them up. The colour is either red, blue, or green; and none but ladies advanced in years wear violet or black. Their shoes are of sattin, embroidered with gold, silver, and silk, and are exceeding neat.

The Chinese in general appear mild, tractable, and humane; and have a great deal of affability in their air and manner, valuing themselves on their being more polite and more civilized than other nations: therefore, whoever has to do with them, must take great care of being too warm or hasty. It is indeed difficult for a stranger to conform to their manners, and to constrain himself to submit to a multitude of frivolous ceremonies that are extremely troublesome, especially when he finds that, under all their affected politeness of behaviour, they are capable of concealing the utmost treachery, and the most base and mercenary views. Though they are extremely revengeful, they fawn on the man they hate, and, dissembling their anger, treat him with the utmost respect, till finding an opportunity of ruining him, they immediately seize it, and triumph in his destruction.

In some parts of the empire the people are so fond of law-suits, that they mortgage their lands, houses, goods, and all they possess, for the ungenerous pleasure of causing an enemy to be bastinadoed; but it sometimes happens that the latter, by giving a larger sum to the villainous mandarine, has the cunning not only to escape the punishment, but to cause it to be inflicted on him who prosecuted the suit.

Interest is, with the greatest part of them, the moving spring of all their actions. When any thing is to be gained they employ their utmost cunning to obtain it, artfully insinuate themselves into the favour of those who are capable of promoting their views, and endeavour to gain their friend-
ship

ship by constant services, with wonderful dexterity assuming all characters, and turning the merest trifles to their advantage.

When they have dealings with strangers, they seldom fail to cheat them when it lies in their power, and even boast of doing so. A captain of an English ship had agreed with a Chinese merchant for many bales of silk: when they were ready, the captain went with his interpreter to the house of the Chinese, to examine the silk if it was in a right condition. They opened the first bale, which proved good; but the next contained nothing but decayed silks: upon which growing very angry, he reproached the Chinese in the severest terms for his knavery; who, having heard him, coolly replied, "Blame, Sir, your raical of an interpreter; for he told me you would not open the bales."

These low frauds are principally observed among the vulgar, who have a thousand tricks to adulterate and disguise what they sell. There are some that have the secret of opening the breast of a capon, taking out all the flesh, filling up the skin, and closing it again so dexterously, that it is not perceived till it comes to be eaten; and they are said to counterfeit hams and gammons of bacon with such art, that the deceit is not discovered till they are served up at the table, and going to be carved, when they find nothing but a great piece of wood under a hog's skin. It is certain that a stranger will be generally cheated if he buys alone; and he has no other way of preventing it, than by employing a trusty Chinese well acquainted with all their tricks: and indeed he will be very happy if he that buys and he that sells do not join in the fraud, and go shares in the profit.

These accounts of the dishonesty of the Chinese in general, are selected from the writings of the missionaries who had long lived in the country, and perfectly agree with the treatment commodore Anson received in the river of Canton, of which we shall here give a few instances. "It were endless, says Mr. Walter, to recount all the artifices, extortions, and frauds, practised on the commodore and his people, by this interested race. The method of buying provisions in China being by weight, the tricks made use of by the Chinese to augment the weight of what they sold were almost incredible. One time a large quantity of fowls and ducks being bought for the ship's store, the greatest part of them presently died: this spread a general alarm on board, it being apprehended that they had been killed by poison; but, on examination, it appeared that it had been only owing to their being crammed with stones and gravel to increase their weight: the quantity thus forced into most of the ducks being found to amount to ten ounces in each. The hogs too, which were bought ready killed of the Chinese butchers, had water injected into them for that purpose; so that a carcase hung up all night, that the water might drain from it, had lost above a stone of its weight. And when, to avoid this cheat, the hogs were bought alive, it was discovered that the Chinese gave them salt to increase their thirst; and having thus excited them to drink great quantities of water, they then took measures to prevent them from discharging it again by urine, and sold the tortured animal in this inflated state. When the commodore first put to sea from Macao, they practised an artifice of another kind; for as the Chinese never scruple eating any food that dies of itself, they contrived, by some secret practices, that great part of his live sea-store should die in a short time after it was put on board, hoping to make a second profit of the dead carcasses which they expected would be thrown over-board; and two thirds of the hogs dying before the Centurion was out of sight of land, many of the Chinese boats followed her, only to pick up the carrion. These instances, he adds, may serve as a specimen of the manners of this celebrated nation, which is often recommended to the rest of the world, as a pattern of all kinds of laudable qualities."

Mr. Le Compte observes, that when a person lends them any thing he must have sureties; for as for their word, those who know them cannot rely upon it. Some of them have been observed to borrow a very small sum, with the promise of restoring the principal with great interest; which they punctually performed upon the day appointed, to gain

the reputation of honest men. After that they desired a greater sum, which they also repayed without fail; and this commerce they have continued whole years together, till obtaining credit for considerable sums, they disappeared for ever.

The subtilty of deceiving is still more extraordinary in thieves and robbers: they break through the thickest walls, burn gates, and make great holes in them by means of an engine, which it is said fires the wood without any flame. They penetrate into the most private recesses without being seen; and when people awake in the morning, they are amazed to find their bed without curtains and coverlets, their chamber unfurnished, and tables, cabinets, coffers, and plate, all carried off, without perceiving any footsteps of the thieves, but the hole in the wall.

It must not however be supposed that there are no honest men in China; there are doubtless many scattered through that great empire, and it is to be wished, for the honour of human nature, there were more: but the greatest part of the Chinese are so self-interested, that they can scarcely believe that any thing is undertaken without a view to interest.

They are in general extremely pusillanimous, and there are scarcely any people upon earth so fond of life; though there are some, especially women, who, through anger or despair, procure their own death: but they seem even still more afraid of wanting a coffin after death, and therefore frequently purchase one above twenty years before they want it, all the while considering it as the most valuable moveable they have in their house.

Yet no people upon earth are more proud of their pretended grandeur, and the pre-eminence they imagine they have a right to claim over all nations. This haughtiness inspires the meanest among them with a contempt for other countries; and they are so full of their own customs, manners, and maxims, that they can scarcely believe that there is any thing good or great out of China, though they are a little more moderate than they once were, since they became acquainted with the Europeans. On their first seeing them, they asked, if there were any cities, towns, or houses in Europe; and, on perceiving that they were acquainted with all the sciences, they were struck with astonishment, and cried, "How is it possible that a people so far remote from us, should have any wit or capacity? they have never perused our books; they were never modelled by our laws, and yet they speak, discourse, and reason as right like us."

The missionaries had often the pleasure of beholding their surprize and confusion, at seeing a map of the world. Some of the learned desiring one day to see such a map, they sought a long time for China, and at length took one of the hemispheres for it, containing Europe, Africa, and Asia, supposing that America was all the rest of the world. The priest left them for some time in their error, till one of them desired an explanation of the names in the map, and then he cried, You see Europe, Africa, and Asia; in Asia here is Persia, the Indies, Tartary. Where then is China? said they. It is this little corner of the earth, replied the priest; and see here its bounds. Filled with astonishment, they stood looking at each other, saying in Chinese, It is very little.

The works produced by our artists, as clocks, watches, mathematical instruments, stuffs, and the like, surprized them still more, for they imagined that ingenious artificers were no where to be found but in China. They were then forced to confess, that we were not such barbarians as they imagined; and in a joking way, said, "We supposed all other people blind, and that nature had bestowed eyes upon none but the Chinese: we now see that this is not universally true; if the Europeans do not see so clearly as we, they have at least one eye."

We shall now take a view of their behaviour to each other, and of that civility and politeness which forms so considerable a part of their character. It is not at all surprising that there should be a ceremonial regulated for the court, though it is that they have established very nice and exact rules in relation to the behaviour of private persons when they have any intercourse, either with their superiors or equals; and that no situation can dispense with their observance of them.

The common salutation is performed by joining their hands before the breast, moving them gently, and making a slight inclination of the head, saying, Prosperity, prosperity. On meeting a person to whom they owe great respect, they join their hands, lift them up, lower them almost to the earth, bowing their body very low, and crying Happiness. If a person is newly arrived, they enquire, if every thing has happened well on his journey. On being asked how they do, they answer, Very well, thanks to thine abundant felicity: and when they see a man in health, they cry, Prosperity is painted in thy face; thou hast a happy countenance. If a person takes any pains to serve them, they say, Thou art too profuse of thine heart. And if you have done them any service, they cry, My thanks shall have no end. They have always such compliments in their mouths, which they utter in an affecting tone, though they seldom proceed from the heart. In conversation they use the most respectful terms; and if they are not intimate friends, for fear of being too familiar, instead of saying, I am sensible of the service you have done me, they cry, The service the Lord has done for his meanest servant has greatly affected me. So a son speaking to his father, will call himself his youngest son, though he is the eldest, and has children himself.

Nothing exceeds the respect shewn by children to their parents, and scholars to their masters. They speak little, and always stand in their presence; and on their birth-day, and on other occasions, they salute them on their knees, and with their forehead several times touch the ground.

It is remarkable that the Chinese have several names, according to their age and rank. At their birth they receive the family name, about a month after they are born the father and mother give them a milk-name as they term it, which is commonly the name of a flower, animal, or the like. When they begin to study, they have a new name from their master added to that of their family, by which they are called while at school. When arrived to manhood they have among their friends another name, which they preserve, and commonly sign at the end of their letters and other writings. In short, if they attain any considerable office, they assume a name agreeable to their rank. By this they are then addressed, and it would be an incivility for one who was not much their superior, to call them by their family name.

If two mandarines of equal rank meet in the street, they salute each other without leaving their chairs, by lifting up their joined hands to their head, repeating it several times till they are out of each other's sight: but if one of them is of an inferior rank, he must stop his chair, or if on horseback, alight, and make a profound reverence to the superior mandarine.

When the governor of a city, after having gained the public approbation, is removed into another province, the people pay him the greatest honours. The road for three leagues together has tables placed at proper distances, covered with silk, which hangs down to the ground, on which they burn incense, and place wax-lights, meats, fruit, and pulse; and on other tables are wine and tea, ready for his use. He no sooner appears than the people fall on their knees, and bow their heads to the ground; some pretend to weep; others presenting him rice, beer, and provisions, beseech him to receive the last testimony of their gratitude. Thus he is stopped at every place; but what appears most extravagant is, to see the people every now and then draw off his boots, and give him new ones: for all the boots that have touched his legs are held in veneration by his friends, who preserve them as a relic in their houses: but the first pair that are pulled off are put in a kind of cage, over the gate of the city through which he passed.

When they are desirous of honouring the governor of the city on his birth-day, the inhabitants of the greatest distinction assemble, and go in a body to salute him at his palace. Besides the common presents, they often take a japanned box, adorned with gold flowers, in which are eight or twelve divisions filled with different sorts of sweetmeats. When they have entered the hall, in which the ceremony is to be performed, they stand in a row and make a profound reverence; then fall on their knees, and bow their heads to the ground, unless the governor prevents them, which he commonly does. The principal person

then takes a cup of beer, and lifting it up as high as he can with both hands, offers it to the mandarine, crying, "Behold the beer which brings happiness. Behold the beer that gives long life." Then another advancing, holds up sweetmeats in the same manner, and respectfully presenting them, says, "Behold the sugar of long life." The same ceremonies, with the same wishes, are afterwards repeated by others.

But if a mandarine has greatly distinguished himself by his equity and humanity, the literati cause a garment to be made of small squares of satin of different colours, as yellow, red, blue, green, and black, which, on his birth-day, they carry, accompanied by instrumental music, to the outer-hall of his palace, and beseech his presence; when he entering, they present him this patchwork garment, desiring him to put it on. The mandarine excuses himself by alledging, that he is unworthy of the honour, till overcome by the importunities of the men of learning and the people who are present, he suffers them to strip off his upper garment, and clothe him with that they have brought him. By these various colours they pretend to represent the different habits of all nations, and to signify that all the people look upon him as their father; on which account this garment is called the habit of all nations. The mandarine indeed never wears it except at this time; but it is carefully kept in the family as a mark of great honour and distinction, and the viceroy is always informed of the honour done him.

The social entertainments of the Chinese are conducted in so ceremonious a manner, that they would be insupportable to an European. Of these there are two sorts, the one common, at which there are about twelve or sixteen dishes, and the other extraordinary, which requires twenty-four on each table. The hall in which the feast is served up is commonly adorned with pictures, flower-pots, and china-ware. There are as many tables as there are persons invited, unless the great number of the guests makes it necessary to put two at each table. These tables stand in a line on each side of the hall, opposite to each other: and the guests face each other as they sit. The fore part of the table is adorned with embroidered silk; but there are neither table-cloths nor napkins: yet, being curiously japanned, they make a fine appearance. On the ends of each table often stand great dishes with meat ready carved, piled up like a pyramid, with flowers and large citrons on the top: but these pyramids are not touched, and only serve for ornament. When he who gives the entertainment introduces the guests into the room, he salutes them one by one, and then a liquor made of rice being brought in a little cup of silver, porcelain, or precious wood, placed on a small japanned waiter, he takes it in both his hands, and bowing to all the guests, advances to the front of the hall, when lifting up his eyes and hands, together with the cup, towards Heaven, he pours the liquor on the ground, to signify that all his possessions flow from the Lord who reigns on high. Then taking a cup of beer, he bows to the most considerable of his guests, and places it on the table where he is to sit. While the guest returns his civility, by endeavouring to hinder him, and causing another cup of beer to be brought, makes as though he would carry it to the place of the master of the feast, which is always the lowest; who, in his turn, prevents him, with the usual terms of civility. The master of the house then brings two small ivory sticks, adorned with gold or silver, which serve in the room of forks, and places them on the table parallel to each other.

He afterwards leads the principal guest to his chair, which is covered with a rich carpet of flowered silk, and bowing low invites him to sit. He excuses himself with much ceremony from accepting so honourable a place; but at last complying, offers it to all the rest, and they excusing themselves, take their places.

Four or five comedians, in rich garments, now enter the room, and bowing, strike their foreheads four times against the ground; and then rising, present to the head guest a book, in which are written, in letters of gold, the names of fifty or sixty plays which they are ready to act upon the spot. But refusing to choose one, he refers him to the second, the second to the third, and so on; but all make excuses, and refer it to the principal guest, who at last chooses
the

the play he thinks will be most agreeable to the company. The comedian then shews the name of the play that is chosen, and each expresses his approbation by a nod. The ladies who are willing to see the play are placed in another room opposite to the comedians, where, through a lattice made of bamboos and a silk net, they see and hear without being perceived.

The representation begins with the sound of instruments, as trumpets, flutes, fifes, drums of buffalo skins, and basons of brass or steel. The floor is covered with a carpet, and, instead of scenes, the players come from the neighbouring rooms.

Mean while the master of the feast, kneeling, intreats his guests to take the cup, at which every one holds a cup in both hands, and lifts it to his forehead; then bowing very low, rises, puts it to his mouth, and drinks slowly three or four times, while the master urges them to drink all up, which he himself does first, and then turns the cup upside down; on seeing which all do so too. Liquor is served two or three times; and, while they are drinking, a dish of meat, cut in pieces, is placed on the table in a china dish: for they know not how to use a knife. The master of the house, then, on his knee invites them to eat, and all take some of the meat on their plates; at every fresh dish the same ceremony is repeated, and they are obliged to drink as often; however, the cups are small, and they may drink as little as they please. After six or eight dishes have been served, they bring soup made of either flesh or fish, and very small loaves in a dish, which they put into the soup and eat without ceremony. At the same time tea is served. When the guests have quitted their sticks, and done eating, they bring in beer and another dish, and the master of the house again invites them to drink and to eat, which is repeated as often as a fresh dish is served up. But, before the fruit is served, the master of the feast takes his guests into the garden, or some other place; mean while the comedians take their repast, and the domestics are employed, some in carrying warm water for the guests to wash their hands, and others in clearing the table and preparing the desert, which consists of twenty or twenty-four dishes of fruit, sweetmeats, dried ducks, which are delicious food, and small dainties, made of things procured from the sea.

At length a domestic, kneeling to his master, informs him, in a low voice, that all is ready. The master watches till every one is silent, and then, with great ceremony, invites his guests to return to the hall. There every one takes his seat as before, and large cups being brought, they are frequently pressed during the desert to drink heartily. Mean while the play is continued, or a farce begun: but, at the beginning of the second course, every guest causes his servant to bring several purses of red paper, which contain money for the comedians and the servants; more or less being presented according to the quality of the person who made the treat: but this money is never given, unless there be a play acted. Every domestic carries his purse to his master, who, with seeming reluctance, consents to their receiving it.

These feasts begin about the evening, and, as they last four or five hours, are not ended till midnight, when they separate with much ceremony, and the servants of the guests walk before their masters chairs, carrying great lanterns of oiled paper, on which the quality and sometimes the name of the masters are written in large characters. The next morning each of the guests sends a billet of thanks for his generous entertainment.

Such are the irksome ceremonies required by the Chinese politeness: but a politeness that consists in such insignificant trifles, and such abject submissions, could never be generally practised by any nation inspired by the love of liberty, or that had just sentiments to the dignity of human nature. It will be proper however to observe, that their cooks have the art of seasoning their meat and fish in such a manner that they are very agreeable to the taste; and that their soups are excellent.

SECT. IV.

Of their Marriages; the extravagant Authority of the Fathers in their Families; their Gaming; their Power over their

Children; their Funeral Ceremonies; their Festivals, particularly the Feast of Lanterns; and the Emperor's going to plow and sow a piece of land.

THEIR marriages are regulated by the grand principle that is the foundation of their political government; I mean the veneration and submission of children to their parents: for it is a maxim of their philosophy, that kings ought to have for the empire all the tenderness of a father, and fathers in their families all the authority of a king. In consequence of those maxims a father lives in some sort without honour or satisfaction if he neglects to marry all his children, and a son fails in the principal duty of a son, if he does not leave posterity to perpetuate his family: though an elder brother inherits nothing from his father, he must educate and marry the younger; because should the family, through his fault, become extinct, his ancestors will be deprived of the honours and duties that ought to be paid them; and because in the absence of the father, the eldest son ought to supply his place.

Hence the inclinations of the children are never consulted; for the choice of the wife belongs either to the father, or to the nearest relation of him who is to be married: but as young women are always confined to their apartments, and men are not permitted to see and converse with them, marriages are brought about by the relations of the maid, or according to the description given of her by old women, whose business it is to transact these affairs, who by presents are engaged by the relations to give a flattering description of the wit and beauty of the maid; but full credit is not given to all they say: and if they are found guilty of a notorious imposition, they are punished.

When by means of these old women every thing is settled, a contract is signed, by which the relations of the intended husband agree to give a certain sum, which is employed in buying new cloaths and other things for the bride; for the daughters have no fortunes. Then follow certain ceremonies, the principal of which consist in sending on both sides to demand the name of the intended bridegroom and bride, and in making presents to their relations of silk, cottons, provisions, and fruit. The bride's relations, who determine the day of the nuptials, frequently consult the calendar for a fortunate day. Mean while the man sends his intended bride jewels, pendants, and the like.

When the nuptial day is arrived, the bride is put into a chair magnificently adorned, and all the fortune she brings is either carried with her, or follows her: among the vulgar it consists of wedding cloaths, and the like, given by her father. She is accompanied by a train of hired persons, with torches and flambeaux lighted, even at noon-day: her chair is preceded with hautboys, fifes, and drums, and followed by her relations and particular friends; a trusty servant keeps the key of the door belonging to the chair, with orders to give it to none but the husband, who waits at his own door dressed, in order to receive her. She is no sooner arrived, than he receives the key from the servant, and eagerly opening the chair, sees her for the first time. Some, dissatisfied with their lot, immediately shut the chair again, and send the maid back with her relations, choosing rather to lose the money they had given, than receive a disagreeable person: but this seldom happens. The bride, on leaving the chair, goes with the bridegroom into a hall, where they make four reverences to Tien, whom they call the spirit that presides in Heaven; and having done the like to her husband's relations, she goes among the ladies who are invited, and spends the day with them in feasts and diversions, while the new-married man treats his friends in another room, and at night consummates the nuptials.

Though according to the laws they can have but one wife, yet they are allowed to have several concubines, whom they receive into the house without any formality, only giving a writing to her relations, in which they promise to give a sum agreed upon, and to use their daughter well: but they are entirely dependant on the wife, serve her, treat her as their mistress, and all their children are considered as the children of the wife, and have an equal right with them to inherit their father's fortune. None but the wife has the name of mother; and if a concubine dies, her children are not obliged to go into mourning, nor to quit their offices and governments, as is customary for them to do at the death of the father, and of the lawful wife, though

though she is not their mother; there are but few, however, who dispense with these ceremonies on the death of their own mother, or are deficient in showing them proper marks of tenderness and respect.

If a wife elopes from her husband, he may sell her, after she has undergone the correction of the law: and if a man abandons his house and family, after three years absence his wife may present a petition to the mandarines, making known her condition, who may give her leave to take another husband; but she would be severely punished, if she married without their consent. In particular cases a man may divorce his wife; as for adultery, which is very uncommon, antipathy, difference of temper, jealousy, indiscretion, disobedience, barrenness, and contagious diseases: but tho' the law on these occasions authorizes a divorce, it is seldom put in force among people of distinction, tho' there are examples of it among the vulgar. Yet the men are so extremely jealous, that they will not suffer their wives to speak in private even to their own brothers.

Though every man is liable to be punished for parting with his wife, without what is esteemed a just cause, and tho' gaming is forbidden to people of all ranks, yet Mr. Le Compte observes, that these laws do not hinder the Chinese from playing sometimes till they have lost all their estates, their houses, their children, and their wives. Yet barbarous as this excess of inhumanity is, they even proceed still farther; for when the avarice of a parent is alarmed by the number of his children, and when his poverty makes him dread his being unable to supply them with necessaries, they cruelly engage the midwives to stifle their poor female infants in a basin of water, as soon as they are born; or expose those helpless innocents by night in the streets. This is so common in populous cities, that it was customary with the missionaries to send out every morning a number of their catechists, who, taking their several walks, baptized a multitude of these dying children.

Indeed a father while living has the power of an absolute despotic tyrant, and after his death is worshipped as a god. Let a son be grown ever so rich, and a father ever so poor, there is no submission, no point of obedience, that he cannot command, or that his son can refuse. He is absolute master, not only of his estate, but also of his concubines and children, who, whenever they displease him, he may sell to strangers. If a father accuses his son before a mandarine, there needs no proof of his guilt; for they cannot believe, that any father can be so unnatural as to bring a false accusation against his own son. But should a son be so insolent as to mock his father, or arrive at such a pitch of wickedness as to strike him, it becomes the concern of the whole empire, and all the province where this shameful act of violence was committed is alarmed. The emperor himself judges the criminal. All the mandarines near the place are turned out of their posts, especially those of the town where he lived, for having been so negligent in their instructions; and all the neighbours are reprimanded for neglecting, by former punishments, to put a stop to the wickedness of the criminal, before it arrived to such a height. As to the unhappy wretch himself, they cut him into a thousand pieces, burn his bones, level his house to the ground, and even those houses that stand near it, and set up monuments and memorials of the horrid deed.

We shall now treat of their funeral ceremonies, which are very remarkable. The Chinese imagine that young people, by being witnesses to the veneration paid to deceased relations, learn betimes the submission and obedience due to those who are living. Their antient sages, says Du Halde, thought that inspiring youth with a profound veneration for their parents renders them submissive; that this submission preserves peace in families; that peace in private families produces tranquility in cities; that this tranquility prevents insurrection in the provinces, and consequently preserves regularity throughout the empire: on this account they have determined what ought to be observed at funerals, and what honours should be paid to deceased relations.

They dress the deceased in his best cloaths, with the usual marks of his dignity; and then put him in the coffin. Those made for persons in easy circumstances are formed of planks above half a foot thick, and so well pitched on the inside, and japanned without, that they transmit no bad smell. The rich expend from 300 to 1000 crowns to purchase a coffin of precious wood finely carved and gilt,

They are prohibited from burying their dead within the walls of cities, and in inhabited places; yet are permitted to preserve them in their houses, where they often keep them several months and even years, and no magistrate can oblige them to bury them. Many, to shew their regard for their deceased fathers, keep their bodies three or four years; and, during the time of mourning, use no other seat than a stool covered with white serge, nor no other bed than a mat made of reeds. They deny themselves the use of meat and strong drink, and frequent no feasts or public assemblies.

At first all the relations and friends that are invited come to pay their last respects to the deceased, when the coffin covered with white cloth is exposed in the principal room, and a table placed before it, on which is an image of the deceased, or some carved work, on which his name is written, and which is surrounded with flowers, perfumes, and wax candles. They all prostrate themselves, and several times beat their foreheads against the floor before the table, and then place upon it candles and perfumes, which they brought with them; the particular friends of the deceased accompanying these ceremonies with tears and groans.

While they are thus employed, the eldest son, accompanied by his brothers, comes from behind a curtain that is on one side the coffin, and with countenances full of grief, without speaking, pay them the same compliment of striking their foreheads against the floor. The women are concealed behind the same curtain, and send forth frequent mournful cries. This ceremony being ended, they all rise up, and a friend in mourning conducts the visitors into another room, where they are entertained with tea and dried fruits, and then conducted to their sedans. These ceremonies commonly last seven days.

Those who have a complete mourning habit, have their cap, vest, gown, stockings, and boots, all white; but in the first months of mourning for a father or mother, their habit resembles a kind of bag made of red sackcloth; they have a sort of cord or a piece of sackcloth for their girdle; and their cap, which is of an odd figure, is of coarse cloth.

The day of the funeral being at length fixed, they give notice of it to all the relations and friends of the deceased, who come on the day appointed. The procession is begun by persons carrying pasteboard figures representing slaves, tigers, horses, &c. Several companies follow, marching two and two; some carry flags, standards, and perfuming-pans; others play mournful tunes on various musical instruments. In some places the picture of the deceased is elevated above the rest, on which is written in large golden characters his name and office. Then follows the coffin covered with a canopy in the form of a dome, made of violet-coloured silk, with tufts of white silk at four corners of a frame that has the dome in the middle; this dome is embroidered. The vehicle in which the coffin is placed is carried by 64 men; but those who are unable to be at the expence, have one that requires fewer carriers. The eldest son, at the head of his brothers, together with the grandchildren, follow on foot, covered with sackcloth, with their bodies bent as if sinking under the weight of their grief. Afterwards proceed the other relations and friends, all in mourning, and in chairs covered with white stuff are the wife, daughters, concubines, and slaves of the deceased, who make the air resound with their cries.

Near the place of burial are tables under cover, where the domestics prepare a repast, for the refreshment of the company; and this being ended, the relations and friends sometimes prostrate themselves again, beating their foreheads against the ground; but most frequently only return their thanks: upon which the sons express their civilities by dumb signs. If it be the funeral of a person of high rank, there are several apartments at the place of burial; and after the coffin is brought, a great number of the relations stay there for two months together, and daily join with the sons of the deceased in their expressions of grief. When death attacks the throne, the mourning becomes general, and all public business is suspended during fifty days.

The sepulchres are built without the cities, and if possible upon eminences; the form is different in different provinces; but they are generally whitened and surrounded with little groves of pines or cypress.

The

The honours paid to their deceased ancestors are not confined to the time of mourning; they resort every spring to their tombs, and, having plucked up the weeds that grow about them, repeat the ceremonies observed at their death, and then place provisions and rice-beer on the tomb, which at length serves them to feast upon. They also every year frequent the hall of their ancestors, which is built by every family, where the persons belonging to all the branches of it, which frequently amount to an incredible number, mingle together without distinction of rank; and the eldest, though the poorest, has the first place. On a long table next the wall is placed the image of the most eminent ancestor, or at least his name, and the names of the men, women, and children of the family, with the age, quality, employment, and day of the decease of each person wrote on boards about a foot long. The richest prepare a feast, and the same ceremonies are used to the deceased as if they were yet living.

The Chinese have other solemn festivals, which they celebrate with great pomp and expence. The first three days in the year are throughout the empire spent in rejoicing. They dress in their best cloaths, and send presents to all their friends, after which gaming, feasting, and comedies take up all their time. Ten or twelve days before are committed many robberies by those who, being destitute of money, are resolved to obtain some to enable them to join in those diversions.

On the fifteenth of the first month is the feast of Lanterns, when every family, both in the city and country, on the sea-coast, or on the rivers, light up painted lanterns; some of which are of an incredible size, and of different forms. Many are composed of six panes or sides: the frame is of japanned wood adorned with gilding, and on every square is spread fine transparent silk, on which is painted flowers, trees, animals, and human figures. The top is crowned with various carved work, from whence hang silk streamers, of different colours that fall upon the six corners, without hiding any part of the light or of the pictures; for on the inside are put lamps, and a great number of wax candles, that give a brilliancy to the pictures, and diffuse a splendor that is extremely agreeable.

Several of them represent objects proper to amuse and divert the people. You see horses galloping, ships sailing, armies marching, and the like performed by moving pictures, set in motion by people who lie concealed, by means of threads which at a distance cannot be perceived.

What adds a new splendor to this feast are the fire-works seen in all parts of the city, which are said to be extremely fine.

Some Chinese doctors pretend that this festival received its origin from a story, which they related to M. Le Comte in the following manner: Three thousand five hundred and eighty-three years ago China was governed by a prince named Ki, the last emperor of the first race, whom heaven had endued with qualities capable of forming an hero; but a love of pleasure taking possession of his heart, soon transformed him into a monster.

Ki had an extraordinary capacity, an engaging address, great courage, and such prodigious strength, that he could break iron with the force of his hands. But he became effeminate, and grew weak; he exhausted his treasures by building a tower embellished with gems in honour to the memory of a concubine; and filled a pool with wine for himself and 3000 youths to bathe in. These and many other excesses induced the wisest men of his court humbly to offer him their advice; but he put them to death: he even imprisoned one of the princes of the empire who endeavoured to divert the passions which clouded his reason. At length he completed the destruction of himself and family.

One day, in the midst of his debaucheries, complaining to the queen, of whom he was extravagantly fond, of the shortness of life, "I should be content, said he, could I but make thee eternally happy; but in a few years, nay perhaps in a few days, death will, in spite of us, put an end to our pleasures; and all my power will not be sufficient to give thee a life longer than that which the lowest of my subjects hopes to enjoy. This thought depresses my spirits, and pours into my heart a bitterness that prevents my relishing the sweets of life. Why cannot I make thee reign for ever? While there are stars

"that never cease to shine, must thou be subject to death? thou who shinest more bright on earth than the stars in the heavens."

"'Tis true, my lord, said this insatuated princess, thou canst not make thy life eternal; but thou mayst forget its brevity, and live as though thou shouldst never die. What need have we of the sun and moon to measure the duration of life? The morning star that introduces the day, and the evening shades that usher in the night, continually remind thee of the beginning and the end of thy days; for as those begin and end, so do ours that are begun advance with precipitation to their fatal close. Come, come, let us no longer cast our eyes on those rolling orbs; but cure thy disturbed imagination by building new heavens ever enlightened, ever serene, ever favourable to thy desires, by erecting a great and magnificent palace shut up from the light of the sun; then hang around magnificent lanterns, whose constant splendor will rival his rays. Thither transport whatever is capable of contributing to thy pleasure. We shall both enter this new world created by thyself. I will be to thee instead of all things, and thou shalt afford me more pleasure than this old world can bestow. There nature, for our sakes, shall be renewed; and we enjoy more delight than the gods. We shall there forget the vicissitudes of day and night: with respect to us time shall be no more; no more shall it be an incumbrance; no more shall it shadow and overcloud our life. If thou wilt be always constant, always passionate, my felicity will seem unalterable, and thine happiness appear eternal."

The emperor, either from the vain hope of deceiving himself, or in order to please the queen, caused the palace to be built, and there immured both her and himself. He had even passed several months to appearance steeped in delights, when the people, enraged at his being thus abandoned to pleasure, obliged one of the wisest princes of the empire to declare against him.

The emperor, had no sooner notice of the conspiracy, than he appeared in public, and placed himself at the head of an army to punish the rebel; but soon seeing himself abandoned by the people whom he had so weakly deserted, he fled. During the three remaining years of his life he wandered in disguise from province to province, in perpetual danger of being discovered; as if Tien had resolved to overwhelm him with continual inquietude, in order to punish him for that soft and effeminate repose in which he hoped to find an uninterrupted succession of delights. In the mean time they destroyed the new palace, and, to preserve the memory of this event, hung up lanterns in every quarter of the city. This custom became anniversary, and a great festival throughout the whole empire.

But we ought not here to omit, another festival, which is not, like the former, of no real advantage to the state: for in a country so populous as China, whatever tends to the encouragement of agriculture must promote the happiness and prosperity of the people. Every spring, after the example of the antient founders of the monarchy, the emperor goes in a solemn manner to plough up a few ridges of land, in order to animate the husbandmen, by his example, in the cultivation of the earth; and in every other city but Pekin the mandarine performs the same ceremony.

The emperor and all his court go first to a place in the field appointed to make an offering to Chang-ti, one of their gods, and to beseech him to increase and preserve the fruits of the earth. This ceremony being over, the emperor attended by three princes and nine presidents of the sovereign courts, who are to assist him at the plough, proceeds forwards; several great men carry a valuable chest, which contains the grain to be sown, while all the court assist with profound silence. There are also present forty or fifty antient husbandmen, and about forty of the younger sort. The emperor having taken the plough and ploughed several times backwards and forwards, he resigns it to one of the princes of the blood, who ploughs in the same manner, as do all the rest. After having ploughed in several places, the emperor sows the different grain; these are wheat, rice, millet, beans, and a kind of millet called cao-leang; and the day following the husbandmen finish the field, who are rewarded by the emperor with four pieces of dyed cotton for cloaths.

The governor of Pekin often goes to visit this field, which is cultivated with great care; he overlooks the furrows, and if he finds a stalk that bears thirteen ears, it is esteemed a good omen. He also goes in autumn to get in the corn, which he causes to be put in yellow sacks, and deposited in the imperial magazine; and this corn is kept for the most solemn ceremonies.

As a farther encouragement to agriculture, every year an husbandman, most remarkable for his skill in cultivating the earth, is made a mandarine of the eighth order, by which he is intitled to wear the mandarine's habit; to visit the governor of the city, and to sit in his presence; after his death his funeral obsequies are agreeable to his rank; and his title of honour is written in the hall of his ancestors.

SECT. V.

Their Skill in Agriculture, Arts, and Manufactures, particularly the Manner of their making Paper and Ink; of their printing and binding Books; and of their making Porcelain and China-ware. Their Silk Manufactures, and Management of the Silk-worm; their Belts; their common Mechanics; the Method by which they stock their Fish-ponds; and several extraordinary Ways of catching Fish and wild Ducks.

THE husbandmen apply their utmost attention to the cultivation of rice; they manure the land extremely, and there is no dung nor any kind of filth which they will not carefully gather for that purpose. They also take care to disperse in certain places the hair of hogs, or any other sort of hair, which they imagine gives strength and vigour to the land. The barbers, when they shave the head, are even careful in saving the hair, which is sold to the farmers for about a halfpenny a pound. It is carried away in bags, and barks are often seen loaded with it.

They at first sow their grain without order; but it has no sooner risen to a foot, or a foot and a half high, than they pluck it up by the roots, and plant it in lines chequerwise.

But before the rice is transplanted, they level the earth and make it smooth: for after having ploughed the land three or four times successively up to the middle of the leg in water, they break the clods with the head of their mattocks; and, then, by the help of a wooden machine, on which a man stands upright while it is drawn by a buffalo, they smooth the earth; so that the plains seem more like vast gardens than open fields.

Though the invention of the Chinese is inferior to that of our mechanics, their japanned works, their china-ware, and the silks imported from China, are a sufficient proof of the ingenuity of the workmen, who are not less skilful in ingenious performances in coral, amber, ivory, shells, and ebony; their carved works, as well as their public buildings, gates of great cities, triumphal arches, bridges, and their towers, have something in them great and noble; in a word, they succeed equally in all kinds of arts that are necessary for the common uses and conveniencies of life.

The Chinese paper is made of the bark of bamboo and other trees; but they use only the second skin of the bark, which is soft and white. This is buried fifteen days in the mud of some standing water, washed clean, and then spread in a dry ditch, where it is covered with lime. In a few days it is taken out again, washed, reduced into a kind of threads, and spread in the sun to whiten and dry. It is then boiled well in a copper, and afterwards reduced by a proper machine to a soft paste. They then take some water in which the branches of a shrub named koteng has been soaked, to render it sly, and mix it with the matter of which the paper is made, taking care not to put in too much or too little. The whole then appears like a thick clammy liquor, and being poured into large and deep reservoirs, they take up with their moulds the surface of the liquor, which almost instantly becomes paper. The moulds or frames they make use of to take up this matter are long and broad, and the bottom composed of threads of bamboo, so that there are sheets ten or twelve feet long, and sometimes more. Afterwards they dip every sheet of paper into allum-water, whence it is called fan paper; fan in the Chinese tongue signifying allum. The allum prevents its sinking, and gives it an agreeable lustre. This paper is

white, soft, and smooth; but is more apt to crack than that of Europe; it easily takes moisture, and by degrees the worms get in it, if proper care be not taken to preserve it. To prevent these inconveniencies, the books should be often beaten, and exposed to the sun. Besides the paper made of the bark of trees, there is some made of cotton, and this is the finest, whitest, and most used: besides, it is not subject to the inconveniencies just mentioned; for it will keep as well and as long as the paper made in Europe. The consumption of paper in China is so great, that it is not surprising they make use of the bark of different trees, and also make it of cotton; for besides the prodigious quantity used in printing, and by the learned and the students, who are almost innumerable, an inconceivable quantity is consumed in private houses; one side of their rooms being nothing but paper windows: on the rest of the walls, which are of plaster, they paste white paper; and the ceiling is made of frames covered with paper, on which various ornaments are drawn.

The invention of paper would have been comparatively of little use to the Chinese, had they not at the same time invented a sort of ink fit to draw their characters upon it. This is what is usually called with us Indian ink. There are several methods of making it; but that mentioned by father Contancin seems most easy to reduce to practice. The receipt he obtained from the Chinese is as follows:

Put five or six lighted wicks into a vessel filled with oil; but observe that the best oil makes the most shining black, and consequently the most esteemed and the dearest ink. Over this vessel place at a proper distance an iron cover in the shape of a funnel, to receive all the smoak: when it has received enough take it off, and with a goose's feather gently brush the soot from the inside upon a dry and strong sheet of paper. The lampblack which does not fall off with brushing, and that sticks fast to the cover, is coarser, and may be scraped off into a dish, to make an ordinary sort of ink. Having thus taken off the lampblack, beat it in a mortar, mixing with it musk, or some sweet-scented water, with a thin lize made of neats leather, to unite the particles. When the lampblack is thus brought into a paste, it is put into neat wooden moulds made to give the proper forms to the sticks of ink; and then having stamped upon them characters or figures of dragons, birds, or flowers which are sometimes gilt, they dry them in the sun or in the wind.

'Tis said that in the city Hoi-tcheou, where they make the most esteemed ink, the makers have many small rooms in which they keep lighted lamps all day; and that every room is distinguished by the oil burnt in it, and consequently by the ink made from it.

When the Chinese write with this ink, they make use of a piece of polished marble, in which are one or more holes proper to hold water, wherein they put one end of the stick, and gently rubbing it, there is in a few moments produced a fluid ink. Instead of a pen they use a hair pencil, which they hold in the hand not obliquely, but upright, as if the paper were to be pricked. The Chinese always write from the top to the bottom, and begin their books where ours end: but their paper being very thin, it will not bear writing on both sides.

Printing, which is but in its infancy in Europe, has been from all antiquity in use in China; but the manner in which it is performed is very different from ours. As we have but few letters, and those capable of composing volumes on all subjects, and in every language, a few characters are sufficient: but the Chinese, who are strangers to this admirable invention, are obliged to make use of a prodigious number of characters, as they have properly no letters but different marks for all the different words in their language. Instead therefore of making use of types, they cut their characters on blocks of wood. When a person intends to print a book, he gets it fairly written on fine transparent paper: then the engraver glues each leaf upon a smooth block of pear-tree, with the face of the letter to the wood, and then cuts away the wood, leaving only the characters; which is done in so exact a manner, that, when printed off, they perfectly resemble the original, and it is difficult to distinguish what is printed from that which is written.

This manner of printing is on many accounts incommodious; it necessarily takes up a great deal of time in engraving, and, as the pages are worked off separately, the time of

of printing a volume must be very considerable; besides, the blocks of wood must be as numerous as the pages, and a volume will be sufficient to fill a room. On the other hand, it is attended with some advantages; they have no occasion for a corrector; for, provided the leaf be exactly written, the engraver seldom makes any mistakes: besides, the author is not obliged to print off more books than he has an immediate occasion for, and never runs the hazard of printing a large impression when the sale is not absolutely certain.

They use no printing-presses as we do, for the paper is too soft to bear it; but when once the blocks are ready, and the paper cut, one man with a brush can print a great number of sheets in a day. They have two brushes, one harder than the other; they dip one a little in the ink, and then rub the surface of the block with it, so as to wet it neither too much nor too little; for if it was too much the characters would be blotted, and if too little they would not print. Having thus inked the characters, they lay the sheet upon the block, and then gently pass the other brush over the paper, pressing it down a little that it may imbibe the ink, which it easily does, as the printing-paper is not dipped in allum.

The ink used in printing is made of lampblack, well beaten and exposed to the sun, and then sifted through a very fine sieve: it is afterwards tempered with aqua-vitæ till it is of the consistence of size, after which it is mixed with water till it is of a proper consistence. Lastly, they add to every ten ounces of ink about an ounce of glue, which they dissolve over the fire, and mix with the lampblack and aqua-vitæ before they are tempered with water.

They print but on one side on account of the thinness and transparency of the paper; hence every leaf of a book is folded, the fold being at the edge of the book, and the opening at the back, where they are bound together. They cover their books with a neat sort of grey pasteboard, to which they sometimes add fine satin or flowered taffety; and some are covered with red brocade, on which are gold and silver flowers. This method of binding is very neat and convenient, but they never gild the edges, nor even colour them.

China-ware is made of a mixture of different sorts of earth; one called pe-turtse is white, with a greenish cast, and is found in the quarries. It is very hard, and being broke into small pieces with hammers, is put into mortars; and by the help of stone-pestles, capped with iron, is reduced into a fine powder. These pestles are worked without ceasing, either by man's labour or by the assistance of water, in the same manner as the hammers of paper-mills. This powder is cast into a large vessel filled with water, and briskly stirred with a strong iron spatula; when, after it has rested a few minutes, there rises on the surface a cream four or five inches thick, which they take off, and pour into another vessel of water. Thus they agitate the water of the first vessel several times, constantly taking off what swims on the top, till nothing remains but the gross part, which they take out and pound afresh. With respect to what is put into the second vessel, they wait till it has formed at the bottom a kind of paste; and when the water appears clear they pour it off gently, and cast the paste into large moulds, in which it is dried.

Another earth used as a material in the composition of China-ware is a kind of chalk, of a somewhat glutinous and soapy nature. They wash it in river-water, to take off a yellow earth that sticks to its surface; and then breaking it, put it into a vessel of water to dissolve; after which they prepare it in the same manner as the other.

The finest, lightest, and most beautiful China-ware is made only by well incorporating together eight parts of this last chalk with two of the former; after which the vessels are turned on the wheel, that is placed on a round board, which whirls round by means of a wheel placed under it, and is turned by the foot in much the same manner as our potters make mugs, bowls, and other vessels: some pieces of China-ware are made in moulds, and all of them pass through a multitude of hands.

The great pieces of China-ware are made at twice, one part is lifted upon the wheel by two or three men, in order to receive its proper shape; and the other half, after it is formed and almost dry, is joined to it and united by the same matter it is made of, moistened with water. When

the pieces thus fastened together are quite dry, they scrape and polish the place where they are joined with a knife, both on the inside and out. In the same manner they apply handles, spouts, and the like.

Men, grotesque figures, animals, idols, busts, and the like, which are hollow, are made in moulds in three, four, or more pieces; after which they are joined together, and finished with tools proper to trace, hollow, and polish the different strokes the mould had not impressed.

As to flowers and other ornaments that seem engraved, they are formed on the china by stamps and moulds; and relievos, ready prepared, are stuck on.

When they have the model of a piece of China-ware that is beipoke, and which they cannot imitate by the wheel only, they make use of a kind of yellow fat clay, which they knead very much, and then apply it to the model; and when the impression is taken, separate the mould from the model in several pieces, which they suffer to dry gently. When they intend to make use of the model, they place it for some time near the fire; after which they fill it to what thickness is designed with the paste proper for making China ware, pressing it in all places with the hand; and then place it a moment before the fire, which loosens the mould by drying up the moisture that united the one to the other. The several pieces thus made separately, are united again in the same manner as the large China-vessels; and the figure being suffered to grow hard, is afterwards finished by tools proper for that purpose.

The labour of painting the China-ware is also divided between a great number of workmen, who do every thing by rote, assisted by a very poor imagination: it is the business of one to make the coloured circle near the edge; another traces the flowers, which are painted by a third. It belongs to one to make rivers and mountains, another makes birds, flies, and other animals; but the figures of men are commonly the worst performed.

Du Halde says they glaze and bake it before this part of the work is performed; and then having painted and laid on the gilding, they bake it a second time.

They use all colours in painting China-ware; though there are seldom any brought to Europe but blue upon a white ground, sometimes mixed with red and gold. Some are quite red with small spots, others entirely blue, others of a shining black, others marbled, and others painted with landscapes, mixed with almost all colours, and enlivened by gilding. This beautiful brittle furniture has been finely imitated in the Dresden china, and in that made at Chelsea, Bow, and at Worcester; some of which, with respect to the beauty of the painting, greatly exceed that made by the Chinese.

The best authors have agreed, that silk and silk-worms came originally from China; from thence they passed to the Indians, from them to the Persians, and from the latter to the Greeks and Romans; among whom silk stuffs, at their first introduction, was valued at their weight in gold.

The silks most in use among the Chinese are plain and flowered gauzes, which are their summer wear; damasks of all sorts and colours, striped sattins, black Nanking sattins, coarse taffeties, brocades, velvets, and a great many sorts for which the Europeans have no name. For their gold tissue, they do not make use of fine gold thread twisted on silk; but cutting a long slip of gilt paper into small slips, very artfully roll them about the silk. These stuffs, when fresh, look very fine; but being soon tarnished by the air, and spoiled by wet, they are unfit for garments. None but the mandarines, and their ladies wear them; and that but seldom.

The Chinese being the first nation that discovered the art of rearing silk-worms, and rendering their labours of service to mankind, a concise account of the manner in which this is performed, and the silk produced in that country, cannot fail of being agreeable to the curious reader; and the more so, as the silk manufacture there is much greater than in any other country upon earth.

The silk-worm proceeds from a small egg no bigger than a pin's head, and grows till it becomes of the size of a caterpillar, feeding all the while on mulberry-trees till it comes to its maturity; it then ceases to eat, and prepares for its dissolution, by wrapping itself in a kind of cochin, or silken ball, of the size and shape of a pigeon's egg: this

task is no sooner accomplished, than its head separates from its body, which is slender, of a light chestnut colour, and covered with hard scaly rings; in short, it is metamorphosed into a chrysalis, and in no respect resembles its original form, but remains without the least sign of life or motion: yet, if taken out of its sepulchral case, it will writhe on being touched; though on opening it no sign of an animal form is to be seen with the naked eye, for nothing appears within its scaly covering but a liquid substance. In this torpid state, without limbs, or any distinction of head or tail, it remains, till at length it awakes to a new life, puts off the rings with which it was surrounded, and making a passage out of its silken sepulchre, appears a perfect moth or butterfly, with head, legs, and wings: yet in this state it never eats, but fluttering about, as if rejoiced at its resurrection to a new and more eligible life, propagates its species; and each female having laid abundance of eggs, both the males and females die.

There are two methods of bringing up these curious insects, both practised in China; these are, either suffering them to expatiate at full liberty on the mulberry-trees, by which they are nourished, or by keeping them in rooms. As in this last method the finest silk is produced, we shall give a particular description of the manner in which the Chinese proceed.

To begin with the eggs, which are laid on large sheets of paper, to which they firmly adhere. The females have no sooner done laying, than those eggs which stick together in clots are thrown away, and the sheets hung up on a beam of the room, with the eggs inward, and the windows are opened in the front to admit the wind: but no hempen ropes must ever come near the worms or their eggs. After some days the sheets are taken down, rolled up loosely with the eggs inward, and then hung up again, during the summer and autumn.

At the end of December, or the beginning of January, the eggs are put into cold water, with a little salt dissolved in it, taking care that it does not freeze, and a China-dish put over them, that the sheets may not swim. Two days after they take them out, hang them up again, and when dry roll them a little tighter, and enclose each separately, standing on one end in an earthen-vessel. Some put them into a lye made of mulberry-tree ashes, and then lay them some moments in snow-water, or else hang them up three nights on a mulberry-tree to receive the snow or rain, if not too violent. The design of this is to cherish the internal heat in the eggs.

The time of hatching them is when the leaves of the mulberry-trees begin to open, for they are hastened or impeded according to the different degrees of heat or cold to which they are exposed. When they are ready to come forth, the eggs swell and become a little pointed.

The third day before they are hatched, the rolls of paper are taken out of the vessel, stretched out, and hung up with the back-sides towards the sun, till they receive a kindly warmth, and then being rolled up close, they are set upright in a vessel in a warm place. This is repeated the next day, and the eggs change to an ash-grey: they then put two sheets together, and rolling them close tie the ends.

The third day, towards night, the sheets are unrolled and stretched on a fine mat, when the eggs appear blackish. If any worms are hatched they must be thrown away, for they would much increase the care and trouble of those who attend them: they then roll three sheets together, and carry them into a pretty warm place, sheltered from the south wind. The next day the people taking out the rolls and opening them, they find them full of worms like small black ants. The eggs not hatched within an hour after must be thrown away, as must also those with a flat head that are shrivelled and discoloured.

The apartment for the silk-worms ought to be on a dry rising ground, in a sweet air, and free from noise. The rooms should be square, and very close, for the sake of warmth; the door should be to the south, and covered with a double mat, to keep out the cold; yet there should be a window on every side, that when it is thought necessary the air may have a free passage. In opening of a window to let in a refreshing breeze, care must be taken to keep out the gnats and flies. The room must be furnished with nine or ten rows of frames, about nine inches one above the other. On these they place rush hurdles, upon which

the worms are fed till they are ready to spin; and, to preserve a regular heat, stove-fires are at the corners of the room, or else a warming-pan is carried up and down it; but it must not have the least flame or smoke. Cow-dung dried in the sun is esteemed the most proper fuel; for the worms like its smell. The women who attend them must be clean and neat, and avoid eating or handling wild succory, the smell of which is prejudicial to the worms; which must be managed with great care before their first molting. Every day is to them a year, and has in it the four seasons: the morning is spring, the middle of the day summer, the evening autumn, and the night winter. While the eggs are kept, before they are hatched, they require much cold; when first hatched they want as much heat; when become caterpillars they need a moderate heat; after the great molting they must be kept cool; when upon the decline they should be warmed by degrees; and a great heat is necessary when they are working their cones.

The mulberry-leaves should be gathered two or three days before hand, and kept in a clean place; the first three days they give them the tenderest leaves cut with a sharp knife into little threads, without bruising them. At the end of three or four days, when they begin to turn white, their food must be increased, but not cut so small: and when they become blackish, they must have a greater quantity of leaves quite whole. As they turn again white, and eat with less appetite, they give them fewer leaves, and fewer still when they grow yellow; and when they are ready to change their skins they give them nothing. Every molting time they must be treated in the same manner.

To render this and what follows intelligible it is necessary to observe, that when the silk-worm leaves its little egg, it is perfectly black; but in a few days it assumes a whitish hue, or an ash-grey; after which its coat becoming sullied and ragged, it casts it off, and appears in a new habit. As it increases in bulk it grows whiter, but inclines a little to green; till ceasing to feed, and sleeping almost for two days, it a second time divests itself of its skin, and appears in its third habit; when its colour, head, and whole form are so changed, that it seems another animal. It now begins to eat again, and continues to do so for some days; then changes to a bright yellow, and relapses into its former lethargy, at the conclusion of which it once more quits its covering; and having continued feeding some time longer, it at length renounces feeding and all society, and builds its silken tomb.

But to proceed. The worms eat equally day and night: the Chinese give them on the first day forty-eight meals, that is, one every half hour; the next thirty; the third day they have still less. As cloudy and rainy weather takes away their stomach, just before their repast a whisp of very dry straw, the flame of which must be all alike, is held over the worms to free them from the cold and moisture that benumbs them, or else the blinds are taken from the windows to let in the full day-light.

Eating so often hastens their growth, on which the chief profit of the silk-worms depends. If they come to maturity in twenty-three or twenty-five days, a large sheet of paper covered with worms, which at their first coming from the eggs weighs little more than a drachm, will produce twenty-five ounces of silk; but if not till twenty-eight days, they then yield only twenty ounces; and if they are a month or forty days in growing, they then produce but ten.

They must be kept extremely clean, and often removed; and when they are pretty well grown, the worms belonging to one hurdle must be divided into three, afterwards they must be placed on six, and so on to the number of twenty or more: for being full of humours, they must be kept at a due distance from each other.

The critical moment for removing them is when they are of a bright yellow and ready to spin; they are then put into a proper apartment prepared for them to work in. This is a large case or closet, divided all round into partitions, each with a shelf; there they place the silk-worms, who afterwards range themselves in their proper situations. There ought to be room for a man to go in, and to keep a small fire in the middle, just to yield a gentle heat, which makes the worms work more eagerly, and renders the silk more transparent. They must be surrounded with mats at a small distance, which must cover the top of the place, to keep off the outward air; and because they love to work in the

the dark. However, after the third day's labour the mats are taken away from one o'clock till three, but the rays of the sun must not shine upon them. They are at this time covered with the sheets of paper that were used on the hurdles.

As to the manner in which the silk-worm performs this work; it at first seems to labour without design, and forms only a kind of flue or down: this is its first day's employment. On the second it begins to form the outside of the cone or ball, in the midst of the loose silk or flue made the proceeding day. On the third day it is quite hid, and the rest of his performance is concealed from our sight. At length the cones being finished in seven days, the worm changes its form and becomes a chrysalis; the cones are then gathered and laid in heaps, but they first set apart those designed for propagation upon a hurdle in a cool airy place.

The next care is to kill the moths in those cones which the people would not have bored. The best way of doing this is to fill large earthen-vessels with cones in layers of ten pounds each, throwing in four ounces of salt with every layer, and covering it with large dry leaves like those of the water-lily, and closely stopping the mouth of the vessels. But in laying the cones into the vessels they separate the long, white, and glittering ones, which yield a very fine silk, from those that are thick, dark, and of the colour of the skin of an onion, which produce a coarser silk.

This is the method of raising worms in the spring, which is the general season for doing it, though some hatch eggs in summer and autumn, and almost every month after the spring crop; but were all to do so, the mulberry-trees would scarce furnish them sufficient food. The silk-worms bred in summer are kept cool, and the windows covered with gauze to keep out the gnats. Those raised in autumn are at first to be kept cool: but after their molting, and when they spin, they must be kept warmer than in the spring.

When the silk-worms are ready to spin, if you lay them on the top of a cup covered with paper, they will spin a piece of silk flat, thin, and round like a large wafer. These are not clogged with this viscous matter which the worms emit when long inclosed, and they are as easy to wind as the cods, without requiring to be wound in such a hurry.

When they wind off the silk they first clear away the down, and then throwing the cones into a copper of warm water, stir them about with small twigs bound together, and cut like brushes; by which means the ends of the silk being disengaged catch on the twigs, and thus are drawn out, and eight, ten, or twelve of them fastened together to a reel, which a woman turns round, and at the same time guides the threads, and substitutes new ones when any of them breaks, till all the silk is wound off.

Though the Chinese chiefly wear silk, yet they are not without woolen and linen manufactures. Wool is very common and cheap, especially in the provinces of Chan-si, Chen-si, and Se-tchuen, where they feed abundance of sheep; yet the Chinese do not make cloth. That furnished by the English is highly esteemed; but being dearer than the finest silks, they buy but little of it: yet as for druggets, serges, and tammies, they make them very well; these are worn by the bonzes, and are commonly manufactured by their wives.

They make cotton cloth; and for the summer nettle linen for long vests. But the cloth most valued, and to be found no where else, is made of a plant called co, found in the province Fo-kien. It is a kind of creeping shrub that spreads over the fields, with leaves much larger than the ivy; they are round and smooth, green within, and downy on the out side: the stems of some are as thick as one's finger, but very pliable and downy like the leaves. When they begin to dry they leave them to rot in water, as they do flax and hemp: the first skin is peeled off and thrown away; but the second, which is more fine and delicate, they divide by the hand into very slender threads, and, it is said, weave it without either beating or spinning it. This kind of linen is transparent and pretty fine, but so light and cool, that the person who wears it seems to have nothing on his back.

Among the other arts practised by the Chinese we ought not to omit their being long acquainted with founding of bells. Some of these are of a prodigious size, par-

ticularly several cast at Peking between three and four hundred years ago, each of which weigh an hundred and twenty thousand pounds. They are eleven feet wide, forty feet round, and twelve feet high besides the ear, which is at least three feet in height: but Le Compte observes, that those of Europe exceed them in sound, as much as they exceed the European bells in size; for, instead of iron clappers, they strike upon them with a large wooden hammer, which probably deadens the sound. They have also great bells in all their cities, which are used to distinguish the hours of the night.

In every city there are mechanics of almost all sorts; some work in their shops, others go about the streets to be hired; but the greater part are employed in private families. For instance, if you want a suit of cloaths, the taylor comes to your house early in the morning, and returns home in the evening. He uses no thimble, but instead of it ties a rag about the ball of his thumb; and he generally sows standing, only leaning against the table on which his work lies. The other handicrafts also work at the houses of their customers, and all bring their tools along with them, even to the smith with his anvil and forge to make things for common use.

The barbers, with their shoulders loaded with a stool, their basin, pot and fire, with a towel and clouts, give notice of their approach with a little bell; and when called, very dexterously on the spot, whether it be in the street, the middle of a square, at the door of a house, or any where else, shave the head, set the eye-brows in order, clean the ears with proper instruments, stretch out the arms, and rub the shoulders, all for less than a half-penny, which they receive with many thanks, and then ring the bell again, in order to obtain another job. The shoe-makers go about in the same manner, and will either make shoes, or, for about three-pence, will sole them so as to last a year or two, if the person does not walk much abroad.

It will not here be improper to mention the method by which the Chinese stock their ponds and pools with fish. In the month of May the country people place mats and hurdles across the river Yang-tse-kiang, in the province of Kiang-si, leaving only room for the passage of the boats. These hurdles stop the spawn, which, together with the water, they convey into proper vessels, and expose it to sale; after which it is carried into different provinces for the purposes already mentioned.

The fishermen, besides nets and lines, the first used in their great fisheries, and the latter in their small, in several provinces fish with a kind of cormorants, which they train up as hawks are taught in Europe to catch birds. Early in the morning one may see on the rivers a considerable number of boats, and several of these birds sitting at the end of each, when, at a signal given by striking the water with an oar, they take their flight, and dispersing over the river, watch their prey, and suddenly diving, seize the fish by the middle, and then rising carry it to the boat. The fisherman takes the bird, and holding its head downward, passes his hand along the neck, to make it discharge the small fish it had devoured; for they are hindered from entering into the gullet by a ring put on the lower part of the neck, which, after the fishing is quite over, they take off, and give them something to eat. When the fish happens to be too large for one bird, they mutually assist each other, one taking the head, another the tail, and bring it to the boat to their master.

They have another method of taking fish: for this purpose they have long narrow boats, on each side of which is nailed a long plank, two feet broad, japanned with very white shining varnish, and slanting gently till it almost touches the water. In the night-time, when these boats are used, they turn them towards the moon, that the reflection may increase the splendor of the varnish; so that the fish, which are sporting about the boats, easily mistaking the colour of the japanned planks for that of the water, frequently leap upon them, and sometimes into the boat.

In some places the soldiers shoot the fish very dexterously with arrows, fastened to the bow with a line of pack-thread; as well to prevent their being lost, as to draw out the fish when it is shot. In other places, where there are great numbers in the mud, men stand up to the waist in water, and pierce them with a three forked spear.

To these extraordinary methods of fishing we shall add the manner in which they take wild ducks, which are very numerous in the lakes. They leave a number of shells of large calabashes or gourds floating in the water, and when they have a mind to catch the ducks, put on their heads one of these shells, with holes to see and breathe through, and then go naked into the water, or swim deep with their bodies, that nothing may appear above the surface but the calabash, which the ducks being accustomed to see floating, approach without fear; when the duck-hunter taking them by the feet, pulls them under the water, wrings their necks, and fastens them to a girdle he wears for that purpose; thus pursuing his exercise, till he has got as many as he can carry, and then returns the shore to disburthen himself of his load.

SECT. VI.

Of their Skill in the Sciences.

WERE we to take a view of the numerous libraries in China, handsomely built, finely adorned, and enriched with a prodigious collection of books; were we to consider the multitude of the doctors and colleges established in all the cities of the empire, their observatories, and constant application to watch the course of the stars; were we farther to reflect, that learning is the only path to preferment, and that for above four thousand years none but the learned have been governors of cities and provinces, and have enjoyed all the offices about the court, we should be tempted to believe that China must be the wisest and most learned nation upon earth. Yet by a very small acquaintance with them we shall soon be undeceived, and fully convinced that they are far from having brought any of the speculative sciences to perfection. But there are two principal obstacles that hinder their progress; the first is, that they have nothing to excite their emulation; and the other, that they who are able to distinguish themselves can do it only by studying morality, the history and laws of their country, and by learning to write in a polite manner. By this means they obtain the degree of doctor, and are possessed of honour and credit. This is soon followed by their obtaining a government, and by their enjoying all the conveniences of life.

Their logic and rhetoric are without rules, imitation generally serving them instead of precept. In the first, they are guided only by the light of reason, without any assistance from art; and, in the last, are satisfied with reading the most eloquent pieces, and observing the strokes most likely to affect the mind.

They pretend to be the inventors of music, and boast of their having formerly brought it to the highest perfection. They like the European music well enough, provided there be but one voice to accompany the sound of several instruments; but as for the contrast of different voices, of grave and acute sounds, syncopes, fugues, and dièses, they consider them as no better than a disagreeable confusion; for all their concerts have no dependence on the variety of tones, or the difference of parts.

They have no musical notes, nor any sign to denote the diversity of tones, the raising and falling of the voice, and the rest of the variations that constitute harmony. They learn the tunes by the ear, and when these are played upon their instruments, or sung by a good voice, they have something in them not disagreeable even to the ear of an European.

Du Halde observes, that in the year 1679, the emperor Cang-hi, who had himself composed some tunes, sent for Grimaldi and Pereira, two missionaries, to play upon an organ and an harpsicord that they had formerly presented him with: he greatly admired the sweetness of our European airs, and seemed to take great pleasure in them; then ordered his musicians to play a Chinese air upon their instruments, and at the same time played himself in a very graceful manner.

While the emperor's musicians were playing, Pereira took his pocket-book and pricked down all the tune, and when they had made an end repeated it without missing one note, which so astonished the emperor, that he bestowed great encomiums upon the justness, harmony, and

facility of the European music; but that which surprised him most was, that the missionary had learnt an air in so short a time, that had given him and his musicians so much trouble, and that by the assistance of characters he could recollect it at pleasure.

The emperor, to be more fully persuaded, sung several different airs, which Pereira pricked down in his book also, and then repeated them with great accuracy and justness: this also pleased the emperor so well, that he owned the European music to be incomparable, and that Pereira had not his equal in the whole empire. This prince afterwards established an academy of music, and made the most skilful persons of that science members of it.

The Chinese have invented eight sorts of musical instruments, which they imagine have the nearest resemblance to the human voice; some are of metal, like our bells; one has some resemblance to our trumpet: they have wind instruments of two or three sorts, as flutes, and a kind of small organ, which yields an agreeable sound. They have also instruments with strings, which are generally of silk, as cymbals and violins, each with only three strings: they have another instrument with seven strings, that is much esteemed, and not disagreeable when played upon by a skilful hand: they have also several kinds of drums, composed of skins, some of which are so heavy that they are obliged to place them on a piece of wood.

They are pretty well versed in arithmetic, of which their books contain the four principal rules, addition, subtraction, multiplication, and division. Yet it is not by calculation that they put them in practice, for they have nothing like our figures by which they can perform the operation. This is done by an instrument consisting of a small board crossed from the bottom to the top by ten or twelve parallel rods, with a separation at a small distance from one of the sides: upon these rods are small ivory balls, that slip up and down; the two which are in the upper division of each rod stand each for five, and five balls below for units.

In joining and separating the balls they reckon as we do with counters, but with such ease and readiness that, Du Halde says, the Europeans, with the assistance of figures, are not near so quick as the Chinese in casting up the most considerable sums.

Their geometry is very superficial; however, they neither want skill nor exactness in measuring their land, and their method of surveying is easy and certain.

The other parts of the mathematics were unknown to the Chinese till they were visited by the missionaries. The emperor Cang-hi was never weary of seeing and hearing of them; on the other hand, the jesuits being sensible how necessary it was for them to procure his protection, omitted nothing capable of exciting his curiosity.

To give him an insight into optics, they made him a present of a semi-cylinder of a light wood, with a convex-glass placed in the middle of its axis; which being turned towards any object, painted the image within the tube to a great nicety.

The emperor, greatly pleased with such an unusual sight, desired to have a machine placed in his garden at Peking, in which, without being seen himself, he might see every thing that passed in the streets and neighbouring places. For this purpose they prepared an object-glass of much greater diameter, and made in the thickest garden-wall a window in the form of a pyramid, the basis of which was towards the garden, and the point towards the street: at the point they fixed a convex-glass, opposite the place where there was the greatest concourse of people, and at the base made a large closet shut up close on all sides and very dark. There the emperor came with his queens to observe the lively images of every thing that passed in the streets, a sight that pleased him extremely; but it charmed the ladies a great deal more; since they could no otherwise behold this spectacle, the customs of China not allowing them to go out of the palace.

Grimaldi gave another surprising instance of his skill in optics, in the jesuits gardens at Peking. He made upon the four walls four human figures, each of the same length as the wall, which was fifty feet. As he had perfectly observed the rules of optics, nothing was seen in the front but mountains, forests, chaces, and other things of this nature; but at a certain point they perceived the figure

of a man well made and well proportioned. The emperor honoured the jesuits house with his presence, and for a long time beheld these figures with admiration. The grandees and principal mandarines, who came in crowds, were equally surpris'd; but what struck them most, was to see the figures so regular and exact upon irregular walls, that in many places had large windows and doors.

In catoptrics they presented the emperor with telescopes of all sorts, and glasses for diminishing, magnifying, and multiplying. Among other things they made him a present of a tube, formed like a prism, having eight sides, which being placed parallel with the horizon, presented eight different scenes in so lively a manner, that they might be mistaken for the objects themselves. They gave him another tube, in which was a polygon-glass, that by its different faces collected into one image several parts of different objects; so that instead of a landscape, woods, flocks, and other things represented in a picture, was distinctly seen an human face or some other figure. They likewise amused the emperor with the shadows of a magic lantern.

Nor was perspective forgotten. Three paintings were shown in the jesuits garden at Pekin; the mandarines flocked thither out of curiosity to see them, and were equally struck with the sight. They could not conceive how it was possible on a plain cloth to represent porticoes, galleries, halls, vistas, and roads, that seemed to extend as far as the eye could reach, and that so naturally that at the first sight they were deceived.

In explaining statics they showed the emperor a machine, the principal parts of which were only four knotted wheels and an iron grapple. By the help of this machine a child without difficulty raised several thousand weight, and stood firm against the efforts of twenty strong men. Some pneumatic machines also greatly excited the emperor's curiosity. They caused a waggon to be made of light wood, about two feet long, in the middle of which they placed a vessel full of live coals, and upon it an æolipile, the wind of which came through a little pipe upon a kind of wheel made like the sails of a wind-mill. This small wheel turned another, and by that means set the waggon in motion for two hours together. The same contrivance was likewise fixed to a little ship with four wheels: the æolipile was hid under the deck, and the wind proceeding out of two small pipes filled the sails, and made the ship wheel about a long time; the artifice being concealed, nothing was heard but a noise like a blast of wind, or like that which water makes about a vessel.

In short, they presented the emperor repeating-watches, clocks with chimes, barometers, and thermometers, which were sent them for that purpose by several European princes. All these different inventions, till then unknown to the Chinese, somewhat lowered their natural pride, and so far raised their opinion of foreigners, that they began to look upon the Europeans as their masters.

It ought not however to be omitted, that no nation whatever has applied more constantly to astronomy than the Chinese, who have made observations in all ages, and from the earliest times have appointed persons to watch the heavens night and day; and this has been one of the principal employments of the learned. Hence they have an account of an eclipse two thousand one hundred and fifty-five years before the birth of Christ: and Gaubil observes, that from above an hundred and twenty years before the same era, they have given the number and extent of their constellations, what stars answered the solstices and equinoxes, the declination of the stars, the distance of the tropics and the two poles. He adds, they were acquainted with the motion of the sun and moon from west to east, and likewise of the planets and fixed stars, though they did not determine the motion of the latter till four hundred years after Christ. But Le Compte observes, that the astronomers, when he was in China, were very unskilful, and took little care to improve that science; for provided their salary was paid, they were in no great trouble about the changes that happen in the sky: but if an eclipse or comet appears, they dare not be so negligent.

Though the Chinese astronomy is of an antienter date than that of any other nation in the world; yet the same author observes, that they reason as absurdly on this subject, as those who are most ignorant and illiterate. They

fancy that in the heavens is a dragon of a prodigious size, who is a professed enemy to the sun and moon, and ready at all times to eat them up. They therefore no sooner perceive an eclipse, than they make a terrible noise with their drums and brass kettles, till the monster being frightened, lets go his prey. Even the chief mandarines fall on their knees in a court of the palace, and frequently bow towards the sun, striking the ground with their foreheads, to express their pity for that orb, or rather to beg of the dragon not to deprive the world of its light.

Thus though the learned are free from this vulgar error, and are persuaded that eclipses are owing to natural causes; yet, from the prevalence of custom, they continue these ridiculous ceremonies, which are practised in the same manner in all parts of the empire.

The Chinese astronomers every year compose a calendar, or almanac, at the head of which is the emperor's edict, by which all are forbid, under pain of death, to use or to publish any other calendar; and of this work several millions of copies are annually sold.

The Chinese year begins from the conjunction of the sun and moon, or from the nearest new moon to the fifteenth day of Aquarius, which, according to us, is the sign which the sun enters about the tenth of January, and stays there till the same day in February: from this point their spring begins; the fifteenth degree of Taurus is the point that determines the beginning of their summer; the fifteenth of Leo, their autumn; and the fifteenth of Scorpio, their winter.

They have twelve lunar months, among which some consist of twenty-nine days and some of thirty; and every five years they have an intercalary month to adjust the lunations with the course of the sun. They, like us, divide the weeks according to the order of the planets, to each of which they assign four constellations, in such a manner, that after the twenty-eight, which succeed each other by seven and seven, they return to the first.

Their day, like ours, begins at midnight, and ends at the mid-night following; but they are only divided into twelve equal hours, each of which contains two of those used by us.

The Chinese have not neglected the art of medicine; they applied themselves to it from the establishment of the empire, and have many authors who treat of that subject; but as they have little skill in natural philosophy, and particularly in anatomy, they have not made the same progress as our European physicians.

They suppose that the body in its muscles, veins, and arteries, resembles a kind of lute, or a musical instrument, whose strings have various sounds, according as they are braced; that all these have a certain kind of temperament proper to themselves by reason of their figure, situation, and various uses; and thus the different pulses are marks by which they can infallibly judge of their disposition, in the same manner as a string by the different degree of tension, or its being touched in one place or another, in a manner more strong or more gentle, shews if it be too loose or too much extended.

By the beating of the pulse they pretend to know the cause of the disease, and in what part of the body it resides; indeed, all their skilful physicians by this means discover pretty exactly the symptoms of distempers; and it is chiefly this that has rendered the Chinese physicians so famous.

When they attend a sick person they lay his arm upon a pillow, and then they place their four fingers upon the artery, sometimes hard and sometimes gently; they take time to examine the beating, and distinguish the differences according as the motion is more or less quick, full or slender, uniform or irregular; which they observe with the utmost attention, and afterwards, without asking the patient, tell him where his pain lies, whether in the head, stomach, or belly; or whether it be the liver or spleen that is affected. They also tell when he shall obtain ease, and when the distemper will leave him. Indeed, the knowledge of the Chinese physicians in this respect, is very extraordinary and surprising.

Some physicians when they visit the sick bring in their chair, or by their servant who follows them, a chest of various drawers, which are separated into forty small compartments well furnished with roots and simples, which they administer according to the nature of the disease: these

these are either sudorific, or serve to purify the blood and humours, to dispel vapours, to stop fluxes, to strengthen the stomach, or are gently purgative.

Others carry no chest, but give a prescription, and leave the sick at liberty to take them of him, or to buy them of the druggists, who are to be met with in almost every city. Some are above dispensing medicines, and these require more for their visits.

The Chinese physicians, after having made use of simple decoctions and restored health, depend very much upon their cordials to extirpate the very root of the disease; they have these of all sorts, generally composed of herbs, leaves, fruit, dried seeds, and roots. Variety of simples are sold in every city of the empire; one province borrows from another what it has not itself, and there are fairs, where nothing but medicines are sold.

The physicians allow water to their patients, but order it to be boiled. They generally forbid all other food, and if the sick person is extremely hungry, they allow him to take but very little; for they imagine that, while the body is indisposed, the stomach is unfit to perform its functions, and that the digestion made in this condition is always pernicious.

S E C T. VII.

Of their public Buildings, particularly the great Wall, which divides Tartary from China; the Pagods or Temples; the China Tower; the Triumphal Arches, the Bridges, and Roads.

THE celebrated great wall, which divides China from Tartary, excels all the fortifications attempted by the ancients, it being fifteen hundred miles long, and continued through three great provinces. It is strengthened by towers, in the same manner as the walls of the cities: the gates are fortified on the side of China with large forts, and where the passes might be more easily forced, they have raised two or three bulwarks behind each other, that each may afford a mutual defence.

As China is divided from Tartary by a chain of mountains, the wall has been carried over them. It begins at a large bulwark of stone, raised in the sea to the east of Peking, and almost in the same latitude, it being in forty degrees two minutes. It is built like the walls of the common cities of the empire, but much wider, and consists chiefly of brick, bound with such strong mortar, that, tho' it has lasted several centuries, it is still pretty entire: it is from twenty to twenty-five feet high, and so broad, that five or six horsemen may travel a-breast with ease. Some parts of the wall are, however, only of earth, which is in particular places cased on the outside. This wall was raised above eighteen hundred years ago by the emperor Chihohamti, to prevent the incursions of the neighbouring Tartars, and, as Le Compte observes, was one of the greatest and maddest undertakings ever known; for though it was prudent to guard the easiest avenues, nothing, he adds, could be more ridiculous than for them to carry their wall to the top of some precipices, which the birds can scarce reach with their wings, and which it is impossible the Tartarian horse should ascend. If they fancied that an army might have clambered up thither, how could they imagine that so low a wall could be any defence? As for my part, he continues, I admire how the materials were conveyed thither. This was not done without a vast expence, and the loss of more men than could have perished by the greatest fury of their enemies. It is said that, during the reigns of the Chinese emperors, this wall was guarded by a million of soldiers; but as that part of Tartary now belongs to China, they are content with manning well the most dangerous and best fortified parts of it.

Among the fortresses of the kingdom there are about one thousand of the first rate, the rest scarcely deserve the name. The cities are divided into three classes; of the first there are above one hundred and sixty, of the second two hundred and seventy, and of the third above twelve hundred, besides near three hundred walled cities, which they omit in this calculation as not worth observing, tho' most of them are trading places, well inhabited. The villages are numberless, especially those of the southern provinces; and in those of Chanfi and Chenfi most of them

are surrounded with walls and good ditches, with iron gates, which the country people shut at night, and guard in the day-time, to protect them from robbers, and from the soldiers, who, in spite of their officers, would insult them as they pass by.

Among the buildings most worthy of notice, we ought not to omit their pagods, or temples, erected by the superstition of the princes and people to their fabulous deities. These are very numerous; the most celebrated of them are built on barren mountains, to which the industry of the people has given beauties denied them by nature. The channels formed in the rocks to convey the water from the heights into reservoirs made for that purpose, with the gardens, groves, and grottos, formed in the rocks for shelter against the heat of the climate, render these solitudes extremely delightful. These temples partly consist of porticos, paved with large square stones, and partly of halls that have a communication by long galleries, adorned with statues of stone, and sometimes of brass. The roofs of these structures shine with very beautiful green and yellow tiles, and the corners are embellished with dragons of the same colours, projecting forward. Most of these pagods have a lofty tower, terminated by a dome, to which they ascend by a winding stair-case. Under this dome is commonly a square temple, which is often adorned with mosaic-work, and the walls covered with the figures of animals and monsters in relievo. Of this form are most of the temples, and these are also the habitations of the bonzes.

The towers erected in almost every city are their principal ornaments, and among these that of Nanking is the most famous. This is called the China-tower. It joins the temple of Gratitude, which is erected on a massive basis, built with bricks, and surrounded with rails of unpolished marble. The ascent to it is by a stair-case of ten or twelve steps, which lead to the hall. This room, which serves for the temple, is a hundred feet high, and stands on a small marble basis, that projects two feet all round, beyond the rest of the wall. The front is adorned with a gallery, and several pillars; the roofs, which in China are generally two, one next the top of the wall, and a narrower over that, are covered with green shining tiles; and on the inside the cieling is painted, and formed of little pieces differently wrought one within the other, which the Chinese esteem very ornamental. Indeed, such a medley of beams, joists, rafters, and pinions, appear extremely singular and surprizing to an European, who naturally thinks that such a work must be very expensive; but, in reality, all this proceeds from the ignorance of the workmen, who are unacquainted with the noble simplicity which renders our buildings at once solid and beautiful. The hall receives no light but through the doors, of which there are three very large ones on the east side, that open into the China-tower.

This last structure makes a part of the above temple, and is of an octagon figure, about forty feet wide, so that each side is about fifteen feet in length. A wall of the same form is built round it, at the distance of two fathoms and a half, and being of a moderate height, supports a roof covered with shining tiles, that seems to proceed from the tower, and forms underneath a pretty kind of gallery. The tower is nine stories high, each adorned with a cornice three feet above the windows, and adorned with a roof like that of the gallery, except its not projecting so far, and these, like the tower, decrease in breadth as they increase in height. The outside of this structure is encrusted with a coarse china-ware, which has, in a great measure, retained its beauty, though the tower has been erected between three and four hundred years. The stair-case, which is on the inside, is narrow, and the steps very high. Each story has a room with a painted cieling, and in the walls of the upper rooms are several small niches, with gilt idols in relievo, forming a pretty kind of inlaid work. The first floor is most lofty; but the rest are all of an equal height, and on the top of the work is a thick pole, that stands upon the floor of the eighth story, and reaches more than thirty feet above the roof. A kind of spiral line like a screw winds round at several feet distance from the pole, and on the top is placed a golden ball, of an extraordinary magnitude. The height of the whole tower, from the ground to the ball, is above two hundred feet.

Triumphal

Triumphal arches are very numerous in every city, but many of them are unworthy of notice. Those at Ning-po have generally three gates, a large one in the middle, and two small ones on the sides; the pillars, consisting of stone, make the door-posts; the entablature is composed of three or four faces, generally without projection, and without any molding except the last, or the last but one, which is in the place of a frieze, and on which they engrave an inscription. The two other gates are made in the same manner, only proportionably less. Upon these triumphal arches, which seldom exceed twenty or twenty-five feet in height, are the figures of men, flowers, birds, and other ornaments, in relievo, that project so much, as to be almost separated from the work.

The canals, which we have already mentioned, are, perhaps, the noblest works of the Chinese, considering their great extent, and their being cased on each side with a wall of large stones, and sometimes with marble. The communication with the country is rendered extremely convenient by the bridges over the canals: these consist of three, five, or seven arches, that in the middle being very high, that barks may pass through it. Some have only one arch; as these are not very thick towards the top, they cannot be strong, but they answer the purpose, as no waggons are ever used in China, and the porters who carry bales of goods pass over these bridges by the help of stairs on each side, with steps about three inches thick. Some of the bridges have three or four great stones placed on the top of the piers, in the form of planks, and there are some of these stones eighteen feet in length.

The bridges built over the rivers are some of them very handsome structures, and of a surprising length: of these there is a remarkable one at Fau-tcheou-fou, the capital of Fo-kien. The river over which it is built is half a league in breadth, and is separated into small arms by several islands, which are all united by bridges, the principal of which has above an hundred arches of white stone, with a balustrade on each side, handsomely carved: but there is still a more extraordinary one at Suen-tcheou-fou, which extends over the point of an arm of the sea, and is two thousand five hundred Chinese feet in length, and twenty in breadth. It is supported by two hundred and fifty-two strong piers, one hundred and twenty-six on each side.

A bridge two leagues and a half to the west of Peking was one of the finest ever seen, till a part of it was thrown down by a sudden inundation. It was entirely of white marble, supported by seventy small pillars, which were separated by pannels of fine marble, on which were carved flowers, foliage, birds, and several sorts of animals. At the east end were two marble pedestals, one on each side, on which were two lions of extraordinary magnitude, under which were several others of a smaller size. At the west end, on two other marble pedestals, stood the figures of two children well executed.

Where bridges could not be built of stone, they have contrived other methods. The famous iron bridge, as it is called, is the work of a Chinese general in former times. On each side of the banks of the Panho, a torrent not very wide, though exceeding deep, they have built a great gate, between two stone piers that are six or seven feet broad, and seventeen or eighteen high. From each of the piers on the east side hang four chains by large rings, which are fastened to the piers on the western side, and there linked together by small chains, which give it the appearance of net-work, with great meshes. On this they have laid thick planks, fastened together; but as they do not reach within some paces of the gate, on account of the bending of the chains, particularly when they are loaded, they have supplied that defect by a floor, supported by brackets. On the sides of the planks they have set up little wooden pilasters, which sustain a small roof of the same materials, the ends of which rest on the piers.

The Chinese have made other bridges in imitation of this, and in particular they have two or three supported only by thick ropes; but those bridges, though small, are tottering and insecure.

In the province of Se-tchuen, they have fastened wooden poles into the rocks of the mountains, and on those have laid thick planks, and thus formed a kind of bridges, or rather roads hanging over the vallies; but these appear

very dreadful to those who are unused to them; yet the people of the neighbouring country pass them on horseback, or on their mules, without the least apprehension of danger.

The Chinese, extend their care to the high roads, which they render safe, handsome, and commodious. These are commonly very broad, and often well paved, especially in the southern provinces, where they use neither waggons nor horses. They have formed ways over the highest mountains, by cutting through rocks, levelling the tops of hills, and filling up the vallies. In some provinces the high roads are lined on each side with tall trees; and at proper distances are neat resting places. Most of the mandarines, when their office is expired, on their return to their country, recommend themselves by works of this kind. The inns too are very large and handsome; but those on the lesser roads are wretched ill contrived buildings.

We have already mentioned the canals, in describing the fertility of the country; and shall take notice of some farther particulars relating to them, in Chap. IX. where we shall treat of the skill of the Chinese in dragging their barks up their sluices, and in conveying them from one canal to another.

S E C T. VIII.

Of the Houses of the Chinese, and their Furniture. Of the Cities of the Chinese in general, and a particular Description of Peking, and of the Imperial Palace in that City. The Civil Policy observed in the Government of the Cities.

THE houses of the middling sort of people are very plain, for they have no regard to any thing but convenience. They commonly begin with erecting pillars, and placing the roof upon them; for most of the buildings being of wood, the foundation is seldom laid deeper than two feet. They sometimes build their walls of brick or clay; but they have generally nothing more than a ground-floor, except those of the merchants, which have frequently a story above it, in which they deposit their goods; In the cities almost all the houses are covered with thick ridge tiles. They place the convex sides downwards, and cover the chinks where the tiles join, by laying on others in a contrary position. The spars and joists are either round or square; upon these they lay either tiles that are large, square, and flat, or else pieces of board, or mats made of reeds, plastered over. When it is a little dry they lay on the tiles, and, if they can afford it, join them with roach-lime.

The vulgar, in building their walls, use unburnt bricks; only in front they are cased with burnt bricks. In some places they are made with tempered clay; and in others of nothing but hurdles, covered with lime and earth. But the walls of the houses of persons of distinction are of ground bricks handsomely carved, or impressed with figures in relievo. In some provinces the houses of the villages are made with earth, and the roof thatched with reeds, and so obtuse that they seem flat.

The houses of the wealthy are much inferior to ours, for, besides the poorness of the architecture, they do not study to adorn them. One principal reason is, their receiving no visits in the inner part of the house, but only in a kind of divan appointed for ceremonies; this is a banquetting-room, all open, that has no other ornament besides one single order of wooden columns, painted and varnished, which serve to support the roof; so that it is not surprising that they should be sparing of superfluous ornaments in apartments scarce ever seen by strangers: they have, therefore, neither tapestry hangings, looking glasses, nor wrought chairs: gildings are in fashion only in the apartments of the emperors or princes of the blood. Their beds, which are their principal ornaments, are never seen by strangers; so that all their magnificence may be reduced to cabinets, tables, varnished screens, some pictures, and several pieces of white satin, upon which are written, in large characters, sentences of morality, and these are hung in different parts of the chambers. Vessels of china-ware are both the common moveables and ornaments of every house; for the tables, the side-boards, and

the very kitchen, is filled with them. Of this ware is made the vessels out of which they eat and drink; they have likewise large flower-pots of it, jars, and other vessels for holding liquids. The pictures with which they adorn their apartments have nothing worthy of notice, but the brightness of the colours; for they are ignorant both of perspective, and the proper dispositions of lights and shades. There are a great number of painters who represent on the chamber walls an order of architecture, without the least symmetry; they form bands or fillets round the rooms, at the top and bottom, and between them columns at an equal distance. They frequently hang up the pictures of their ancestors, and sometimes pieces of fatten, on which are painted flowers, fowls, mountains, and palaces. The rooms are also sometimes adorned with silk lanterns.

Though you are not permitted to enter the bed-chamber, yet their beds are very fine. In summer they have taffery curtains, embroidered with flowers, trees, and birds, in gold and silk. Others have curtains of the finest gauze, which is sufficient to admit the air, and yet is close enough to defend them against the flies and gnats, which are here in tolerable in the night. In winter they make use of coarse fatten, embroidered with dragons and other figures, and the counterpane is in the same taste. They do not use feather-beds, but their cotton quilts are very thick: their bedsteads are of joiners work, adorned with carved figures, some of which are very handsome.

Most of the cities of China resemble each other so nearly, that the seeing of one is almost sufficient to entertain a perfect idea of the rest. They are generally square, when the ground will permit, and encompassed by high walls, defended by towers, built as buttresses as convenient distances, and some have ditches either dry or wet. Within the cities are also other towers either round, hexagonal, or octagonal, and eight or nine stories high; triumphal arches in the streets; tolerably handsome temples, consecrated to their idols, or erected in honour of their heroes, and those who have been of important service to the state. In fine, there are public buildings more remarkable for their great extent than for their magnificence. To which we may add, many large squares, and long streets, in some cities very wide, and in others narrow, with houses on each side, that have only a ground-floor, or one story at most.

Having thus described the cities of China, in general, we shall give a particular description of Pekin, or Peking the residence of the emperor.

Pekin, the capital of the whole empire of China, and the ordinary residence of the emperors, is situated in the 40th degree of north latitude, in a very fertile plain, 20 leagues distant from the great wall. Its neighbourhood to the sea on the east, and the great canal on the south, afford it a communication with several fine provinces, from which it draws great part of its subsistence. It is an oblong square, and is divided into two cities: that which contains the emperors palace is called the Tartar city, because the houses were given to the Tartars when the present family came to the throne; and they refusing to suffer the Chinese to inhabit it, forced them to live without the walls, where they in a short time built a new city; which, by being joined to the other, renders the whole of an irregular form, six leagues in compass.

The walls and gates of Pekin are of a surprising height, so that they hide the whole city; and are so broad, that centinels are placed upon them on horseback; for there are slopes within the city of considerable length, by which horsemen may ascend the walls; and in several places there are houses built for the guard. Upon these walls towers are erected within bow-shot of each other; and, at proper distances there is placed one of an extraordinary height, in which may be stationed a small body of reserve. The gates are neither embellished with statues, nor other carving, all their beauty consisting in their prodigious height, which at a distance gives them a noble appearance. There are nine in number; all are well arched, and support very large pavilions nine stories high, each story having openings either of windows or port-holes; and on the lowest story is a large hall, where the officers and soldiers retire who come off the guard. Before each gate is an open space of about three hundred and sixty feet, which serves for a

parade, surrounded by a semi-circular wall, equal in height and breadth to that which incloses the city; and into this parade you enter, not at the front, but at the side wall, where you pass to the gate which commands the country; and proceeding through it, turn to the right, and come to a second tower which commands the city, and has a gate like the former; but the gate-way is so long that it grows dark in the middle. The arches of the gates are built of marble, and the rest with large bricks, cemented with excellent mortar. The ditch is dry, but very broad and deep; and the city is as regularly defended by a strong garrison, as if the people were under the continual dread of a siege.

Most of the streets are built in a direct line, the largest are about one hundred and twenty feet broad, and a league in length. The shops where they sell silks and China-ware generally take up the whole street, and afford a very agreeable prospect. Each shop-keeper places before his shop, on a small kind of pedestal, a board about twenty feet high, painted, varnished, and often gilt, on which are written in large characters, the names of the several commodities he sells. These being placed on each side of the street, at nearly an equal distance from each other, have a very pretty appearance; but the houses are poorly built in front, and very low, most of them having only a ground floor, and none exceeding one story above it.

Nothing can be more surprising than to behold the innumerable multitudes who crowd these streets, without seeing one single woman among them; and the confusion occasioned by a vast number of camels, horses, mules, asses, chairs, waggons, and carts; without reckoning the crowds of one or two hundred men who, at a distance from each other, are gathered about fortune-tellers, players at cups and balls, ballad singers, or to hear a fellow read a comical story to make them merry: or to listen to the quack doctors, who distribute their medicines, and with many rhetorical flourishes explain their wonderful effects. Besides, the streets are always incommoded with either mud or dust; hence both winter and summer are equally troublesome to those who walk abroad; for the dirt spoils their silk boots, and the dust sticks to their cloaths, especially if they are made of fatten, which they have a way of oiling to give it a greater lustre. There is indeed so much dust raised by the multitude of horses, that the city is constantly covered with a cloud of it, which gets into the houses and penetrates into the closest closets; so that, notwithstanding all their care, their goods are full of it. Indeed they strive to alleviate this inconvenience by continually sprinkling the streets, but still there is so much left as is prejudicial both to health and cleanliness.

Of all the buildings in this great city the most remarkable is the imperial palace, the grandeur of which does not consist so much in the nobleness and elegance of the architecture, as in the multitude of its buildings, courts, and gardens, all regularly disposed; for within the walls are not only the emperor's house, but a little town, inhabited by the officers of the court and a multitude of artificers employed and kept by the emperor; but the houses of the courtiers and artificers are low and ill contrived.

The inner palace contains nine courts built in one line, without mentioning the wings which contain the kitchens, stables, and other offices. The arches through which you pass from one to the other are of marble, and over each is a large square building, in a kind of Gothic taste, for the timbers of the roof projecting from the wall are formed by other pieces of wood into a kind of cornice, that has a pretty appearance at a distance. The sides of each court are joined by smaller apartments or galleries; but on coming to the emperor's lodgings, the porticoes, supported by stately pillars, the gilt roofs, the carved work, varnish, gilding, and painting of the halls, the marble steps by which you ascend to them, and more particularly the great number of different pieces of architecture of which they consist, appear extremely splendid. The whole is covered with shining tiles of such a beautiful yellow, that at a distance they seem as bright as if they were gilt. Another roof, as splendid as the former, springs from the wall and ranges round the buildings, supported by a multitude of beams, joists, and spars, japanned with gold flowers on a green ground. The terraces on which the apartments are built, contribute

contribute to give them an air of grandeur; they are fifteen feet high, cased with white marble, and adorned with ballustrades of pretty good workmanship, open only at the steps, placed on each side, and in the middle and corners of the front; but the ascent in the middle is only a slope of marble, with neither steps nor landing-place. No person is permitted to pass this way into the apartments; the emperor alone is carried through in his covered chair, on days of ceremony.

The hall appointed for ceremonies has on the platform before it large brazen vessels, in which perfumes are burnt during any ceremony; and also candlesticks, in the shape of birds, large enough to hold flambeaux. This hall is about one hundred and thirty feet in length, and almost square; the ceiling is carved, japanned green, and adorned with gilt dragons. The pillars that support the roof are at the bottom 6 or 7 feet in circumference, incrusting with a kind of paste, and japanned red. The pavement is in part covered with an ordinary sort of carpets, in imitation of those of Turkey; but the walls are destitute of all ornaments, they are well whitened, but have neither tapestry, paintings, looking-glasses, nor sconces. In the middle of this room is a throne, under a lofty alcove, very neat, but neither rich nor magnificent. There are other lesser halls, concealed by the former; one of them is a pretty circular room, with windows all round, and is adorned with japanned work of various colours; the other is of an oblong form.

On viewing these buildings the different pieces of architecture dazzle the eyes of the beholder, but the imperfect notion the Chinese have entertained of all the arts, is shewn by the most unpardonable faults. The ornaments are not only irregular and puerile, but the apartments are ill contrived, and want that connection which forms the beauty and convenience of the European palaces, and cannot fail of disgusting all who have the least skill in architecture.

The guards at the gates and the avenues have no other arms but their scymitars. The whole palace was formerly inhabited by eunuchs, whose power and insolence at length grew to such a height, that they became insupportable to the princes of the empire; but the last emperors descended from Tartary have so humbled them, that the youngest are obliged to serve as pages, while the task of the others is to sweep the rooms and keep them clean; and for the least fault they are severely punished.

The emperor's house is the only one in Pekin that deserves the name of a palace; the others are extremely mean, and none of those of the grantees exceed one story high; however, the many rooms for themselves and their servants make some amends for their want of magnificence. The Chinese nobility, like those of other nations, are fond of making a splendid appearance; but, with respect to their houses, they are curbed by the customs of their country. Le Compte observes, that while he was at Pekin, one of the principal mandarines caused a house to be erected for himself, that was more lofty and magnificent than the rest; for this supposed crime he was accused before the emperor; when, being afraid of the consequence, he pulled it down while the affair was under examination.

Among the most remarkable buildings is the imperial observatory, of which some of the missionaries have been extremely lavish in their praises. Le Compte says he conceived an high idea from their descriptions of this famous place, but was much disappointed on seeing it. In going to it he and his friends entered a court of moderate extent, where they were shewn the dwelling-house of those who have the care of the observatory; then ascending a narrow stair-case, they reached the top of a square tower, joined on the insides to the walls of Pekin, and raised ten or twelve feet above the bulwarks. Upon this platform the Chinese astronomers had placed their instruments, which, though but few, took up the whole space; but Father Verbieft, having thought them useless, had prevailed on the emperor to pull them down, and to have new ones set up of his own contriving: the old ones were therefore in a hall near the tower, buried in dust and oblivion. Le Compte saw them through a window secured with iron bars, and they appeared large and well cast; he had, however, an opportunity of examining more narrowly a celestial globe, of about three feet diameter, left in a bye court; when

he found that it was of a form inclining to an oval, divided with little exactness, and the whole work very coarse. The Chinese would never have been persuaded to leave these old instruments, and make use of those set up by the priest, which are infinitely superior to them, without the express orders of the emperor; for they are more fond of the most defective pieces of antiquity, than of the most noble improvements.

But to return to the description of Pekin in general. All the riches and merchandize of the empire are continually pouring into this city. It is usual to be carried in a chair, or more commonly to ride through the streets, and chairs and hackney horses are easily procured. For a shilling or fifteen-pence one may hire a horse or mule for a whole day; and, as all the streets are filled by great crowds of people, the owner often leads his beast by the bridle, in order to make way. These people know exactly the street and house where every considerable person lives: there is also a book which gives an account of the place of residence of every one who has a public employment.

All the great streets, which are drawn by a line from one gate to another, have several guards both for day and night; the soldiers walk with their swords by their sides and whips in their hands, in order to chastise those who raise any disturbance; and they have power to take into custody whom-ever they find quarrelling.

The little streets, which extend into the greater, have gates in the manner of a lattice, which do not prevent seeing all that pass along; they are guarded by the soldiers placed over against them in the great street; and there are others on duty in the middle of most of those small streets. The lattice-gates are shut at night by the guard, and are seldom opened except to persons who are well known, who carry a lantern in their hand, and are able to give a good account of the motives of their appearing in the streets, as that they were going to fetch a physician, or the like.

At the first stroke given by the watch on a great bell, a soldier or two comes and goes from one guard to the other, and as they walk along continually play on a sort of rattle; the guard must also answer every call of the sentinel on duty. The governor himself is obliged sometimes to walk round the town, when his presence is least expected; and also the officers who keep guard on the walls, where they beat the hour on large drums of brass, and send subalterns to examine the quarters that belong to their respective gates: the least neglect is punished the next day, and the officer is broke.

This exact discipline, which prevents all nocturnal assemblies, is expensive to the emperor, for a great number of soldiers are kept intirely to take care of the cities; they are all foot, and have large pay. Besides their watching night and day, it is their duty to see that every person cleans the street before his door; that it is swept every day, and in dry weather watered morning and night; and that the dirt be taken away after rain. The streets being very wide, one of their chief employments is to labour at keeping the middle of the streets clean, for the convenience of passengers: after they have taken up the dirt, they level the ground; for the city is not paved.

To preserve order in the cities, they are divided into wards, each of which has a principal, who takes care of a certain number of houses, and is answerable for every thing that happens within his district; and if any tumult should be raised, and the mandarine not be immediately informed of it, he would be severely punished.

Masters of families are equally responsible for the conduct of their children and servants, and persons in authority are esteemed guilty when those who should pay them obedience and respect have committed a crime; even the very neighbours themselves are obliged to lend their mutual assistance, whenever any misfortune happens, or any crime is committed.

If a quarrel happens among the populace, and they come to blows, they take care to shed no blood; and therefore if they chance to have any weapon of steel in their hands, they lay it aside, and use only their fists. They frequently put an end to their contests by complaining to the mandarine, who sitting in his chair of state, surrounded by his inferior officers, coolly hears both parties plead their cause; after which he sentences the culpable person to be bastinadoed in his presence, and sometimes both together.

There

There are common prostitutes in China as well as in other countries; but as they naturally cause disturbances, they are not permitted to live within the walls of the city. The houses they inhabit are of a particular kind, and several of them lodge together, generally under the management of a man, who is answerable for any disorder they shall occasion: yet, notwithstanding this, lewd women are scarcely tolerated; for some governors of cities will not permit them to live within their district.

A good guard is always kept at the gates of every city, who examine all passengers that enter in; especially if any singularity renders them suspected; so that if their countenance, air, or accent, raises a suspicion of their being strangers, they are immediately stopped, and notice sent to the mandarine. It is one of their principal maxims, which they believe greatly contributes to good government, that foreigners ought not to be suffered to settle in the empire; for, besides their hatred and contempt of other nations, they are persuaded people of different countries would introduce a diversity of manners and customs, which would gradually bring on personal quarrels, that would end in parties, and proceed to rebellions fatal to the tranquillity of the empire.

S E C T. IX.

Of the Chinese Junks and Barks, with their Method of raising the Barks up the Torrents of the Sluices of the Canals; of their hauling them from one Canal to another; and the Manner in which they sail down the Cataracts of the Rivers. Of their Fleets, and of the Mariners Compass used by the Chinese.

THE Chinese junks are in every respect inferior to our ships, few carrying more than from two hundred and fifty to three hundred tons, and are properly only wide barks, about eighty or ninety feet in length, with two masts. The fore part is not made with a beak-head, but is split and rises up in the manner of two wings or horns, which has an odd appearance. The stern is split in the middle, in order to afford shelter for the rudder in a high sea. This rudder, which is about five or six feet broad, may easily be raised or lowered by means of a cable that is fastened to it from the stern. These vessels have neither mizen-mast, bow-sprit, nor scuttle, but only a main-mast and fore-mast; to which they sometimes add a top-mast, that is of little use. Their main-mast and fore-mast are placed very near each other, and their proportion is commonly as two to three; and the height of their main-mast is usually two-thirds of the whole length of the vessel.

Their masts, sails, and rigging are extremely rude; for their masts are made of trees no otherwise fashioned than by barking them, and lopping off their branches. Each mast has only two shrouds of twisted rattan, which are often both shifted to the weather side; and the halyard, when the yard is up, serves instead of a third shroud. The sails are of mat, strengthened every three feet by an horizontal rib of bamboo; they run up the mast with hoops, and when they are lowered down, fold upon the deck.

These vessels are not caulked with pitch and tar, but with a particular kind of gum, mixed with lime and the threads of rasped bamboo, and, by means of a well or two at the bottom of the hold, they keep the vessel pretty dry, by drawing out the water in buckets; for they are unacquainted with the use of pumps. Their anchors are not made of iron, like ours, but of iron-wood; and they pretend that they are much more serviceable than those of iron, because they will not bend: however, the two ends are commonly tipped with iron. These vessels are very indifferent sailers, though they hold much more wind than ours, because of the stiffness of the sails, which do not yield to the gale.

The traders carry no cannon, and appear utterly incapable of resisting any European armed vessel. Nor is the state provided with ships of considerable force, or of a better construction, to protect their merchant-men; for at Canton, where their principal naval power is doubtless stationed, commodore Anson saw no more than four men of war-junks, of about three hundred tons burthen, of the make already described, and mounted with only eight or

ten guns, the largest of which did not exceed a four pounder.

The barks appointed to carry the mandarines into the provinces, are flat-bottomed; they are of three sorts, and some of them are very large and neat, being painted, gilt, embellished with dragons, and japanned both within and without. Those of the middle size are most in use, and are about twenty-four feet long, sixteen broad, and nine in depth from the deck. Besides the cabin of the master of the bark, who has his family, his kitchen, two rooms, one before and another behind, there is a hall about six or seven feet high, and eleven broad; an anti-chamber, two or three other rooms, and a by-place without ornaments, which form the mandarine's apartment, and are all upon the same deck. It is all coloured with red and white japan, and adorned with carved work, painting, and gilding upon the ceiling, and on the sides; the tables and chairs are japanned with red and black; the hall has windows on each side, which may be taken away at pleasure. Instead of glass they make use of very thin oyster-shells, or fine silk glazed with transparent wax, and adorned with painted trees, flowers, and a variety of figures. The deck is surrounded with galleries, through which the sailors pass and repass, without incommoding the passengers. This apartment is covered with a kind of platform, open on all sides, and upon it sit four or five musicians, who make a harmony that can ravish no ears but those of a Chinese. The hold is divided into several apartments that contain the baggage. The sails, as in the other vessels, are made of mats.

To force on the great barks, they also make use of long thick poles, or else of oars of several shapes. These are commonly poles, with a broad end, and a hole in the middle to receive the pegs fixed on the sides of the bark: there are others that are never taken out of the water, but are moved to the right and left, and resemble the motion of a fish's tail. When the winds are contrary, or they are obliged to go against a rapid stream, they are drawn along with ropes, which are generally formed of canes made into threads.

The bark that carries a great mandarine, has always a small and light one appointed to go before, to give notice, that all things necessary may be prepared in the passage; and he is always followed by several others, one of which contains his kitchen, catables, and cooks, and another is full of soldiers. All these barks have their rowers, and, in case of necessity, are also drawn with ropes along the bank, by a number of men that are supplied by the mandarines of each city, and are changed every day.

When a number of mandarines go together, which is often the case, they spend their time very agreeably; they visit each other almost every day, without being troubled with ridiculous ceremonies, and mutually treat each other. This society appears the more agreeable from its not being forced and constrained as in other places, by the incumbrances of nice ceremonies, nor subject to those suspicions that a free correspondence would infallibly create, were they to act with such freedom in the cities.

There are an infinite number of barks belonging to private persons, and some that are very convenient, are let out to learned or wealthy men who have a mind to travel; others that are of a larger size are used by the merchants in commerce: besides, there are a prodigious multitude of other barks, in which whole families reside, and have no other habitation. In the smallest sort of these, where there are no cabins, they use thin mats about five feet square, which they set up in the form of an arched roof, to defend them from the rain and heat of the sun.

Some of the barks resemble a kind of galleys, and are proper for sailing on the rivers, sea coasts, and among the islands. These are as long as our trading-ships of three hundred and fifty tons, but they draw only two feet water; their oars are of a great length, and do not lie across the sides of the bark, like those in Europe, but are supported on the outside, almost in a parallel line to the body of the vessel; hence the oars are easily moved, and they go very swiftly.

The merchants who trade in timber and salt are esteemed the richest in all China. These merchants cause the timber to be cut down in the mountains, when being sawed into beams, planks,

planks, and boards, it is brought to the side of the rivers; they then bore holes in the ends of the pieces, and fastening them together, form floats five feet high, ten broad, and of any length, there being some that extend half a league. The several parts of the raft thus joined, move easily any way, like the links of a chain, and are guarded by four or five men on the fore part with poles and oars; while others, placed at equal distances along the sides, help to conduct it. Upon these rafts they build from space to space booths or houses, covered with boards or mats, where they dress their provisions, stow their moveables, and take their rest. In the different cities at which they touch they sell these houses along with their timber. They float above six hundred leagues when they convey the timber to Pekin.

If the Chinese, as it is affirmed, be the first inventors of the mariner's compass, they have hitherto made little advantage of that admirable discovery, but steer their course by a card of a very simple make. The rim of the box is divided only into twenty-four points, instead of thirty-two and is placed upon a bed of sand. They direct the head of the ship to the rhumb they design to steer upon, by the help of a filken thread, which divides the surface of the card into two equal parts. For instance, to sail south-east, they put this rhumb parallel to the keel of the ship, and then turn the vessel till the needle point to north-west, marked on the rim. The needle of the largest compass is about three inches long, one end of which has a kind of flower de luce, and the other a trident. The Chinese are so absurdly superstitious as even to worship the compass, to offer it incense, and place meat before it.

Though the Europeans greatly exceed the Chinese in the art of navigation in the open sea, yet upon rivers and canals they have a particular skill that we are not masters of. In the canals are sluices made to retain the water, and these they are able to ascend and descend, which cannot be done without great art and considerable danger. One of these sluices is called by the Chinese The queen and mistress of heaven, on account of its extraordinary height; and yet up this great fall of water the barks are drawn by four or five hundred watermen, or more if required, many of whom haul by a great number of ropes fastened to the prow, while others labour at capstans placed upon the walls of the canal. When the ropes are all fastened they begin to haul up the sluice leisurely by the sound of the bafon, on which they at first strike slowly, till near half of the bark is raised above the upper channel; and then beating faster on the bafon, all the watermen haul together, and at one pull mount the vessel up and secure it in the dead water, between the sides of the canal and the current.

The barks descend this fall with more speed and ease, but with much greater danger. To prevent any accident men on each side hold ropes fastened to the bark, and give them way or hold them tight as they see occasion. There are others in the vessel with long poles to keep her in the middle of the canal. As soon as she has got down into the lower stream, the ropes are let go, and she shoots forward with the swiftness of an arrow shot from a bow.

Le Compte observes, that in some places where the waters of two canals have no communication with each other, they make the barks pass from the one to the other up a slope fifteen feet high: for at the end of the upper canal they have built a double glacis or sloping bank of free-stone. When the bark is in the lower channel, they, by the help of capstans, hoist it up the first glacis, till being raised to the top it falls by its own weight down the second glacis into the water of the upper channel, where it scuds away with great swiftness for some time. After the same manner they cause it to descend from the higher to the lower canal. Le Compte expresses his surprise, that these barks, which are commonly very long and heavy laden, escape being broke in the middle, when poised in the air upon this acute angle; yet he never heard of any ill accident of that kind: all the precautions taken by the people when they do not choose to go ashore is to tie themselves fast to something on board, for fear of being thrown down or tossed out of the vessel.

Besides the steep water-falls in the canals, there are certain rivers that flow with prodigious rapidity across abundance of rocks, for the space of seventy or eighty leagues together, forming a most rapid and dangerous current.

In the province of Fo-kien there is a river in which the cataracts are continual, and the people sail eight or ten days in perpetual danger of perishing, the torrents being broken by a thousand points of rock that scarce leave breadth sufficient for the passage of the barks. There are nothing but turnings and windings, while the contrary currents dashing against each other, hurry the bark along with surprising velocity. You are always within two feet of shelves; that in avoiding one you fall foul upon another, unless secured by the surprising skill of the pilot. No people in the world, except the Chinese, are capable of undertaking such voyages; yet, notwithstanding all their address, scarcely a day passes in which some vessel is not lost, and it is a wonder that they do not all perish.

The barks they make use of are built with very thin light timber, that they may be more easily managed, and are divided into five or six apartments, separated by strong partitions; so that when they strike upon a rock only one division is filled with water, while the other parts remaining dry afford time to stop the leak. To check the rapidity of the motion where the water is not too deep, six seamen, three on each side, hold a long pole against the bottom, and by means of a small rope give way by little and little; or one end being fastened to the bark, and the other twined round the pole, it slips leisurely; and by a continual rubbing, slackens the motion of the vessel: so that if the torrent be ever so rapid, yet, if it be even and uniform, you float with the same slowness as if you were on the calmest canal.

When the stream winds and turns they have recourse to a double rudder, shaped like an oar, forty or fifty feet long, one at the head and the other at the stern. All depends on plying these two great rudders: the reciprocal jerks they give the bark to drive it on or turn it into the current, to shun the rocks, or cut a torrent, and to pursue a fall of water, without running headlong with it, whirl it about a thousand different ways. It is not navigation, says Le Compte, it is a manage, for no managed horse labours more under the hands of a riding-master, than the bark does under those of the Chinese mariners; so that when cast away, it is not so much for want of skill as strength: for did each of them, instead of eight men, carry fifteen, all the violence of the torrents would not be able to hurry them away.

S E C T. X.

In what Manner the present Tartarian Family ascended the Throne of China. The Authority and Power of the Emperor, his Revenue, and Forces. The Pomp in which he appears whenever he goes out of the Palace; and when he goes to make his Offerings at the Temple of Tien.

NOTWITHSTANDING the great antiquity and power of the Chinese empire, it was subdued by a foreign power but little more than a hundred and twenty years ago, when the king of Tartary made himself master of that crown. This conquest, through the various factions which divided the court and the empire, was made with surprising facility. The greatest part of the imperial army was then employed near the great wall in repulsing the king of the Manchews, a nation of the Eastern Tartars. That prince, in order to revenge the injustice which his subjects had received in their trade with the Chinese merchants, and the little regard the court had shewn to his complaints, had entered into Leao-tong at the head of a formidable army, and begun a war that lasted several years, with various success on both sides.

Mean while the emperor Tsong-tching lived in tranquillity in his capital, while the unjust punishments he had inflicted on one of his principal ministers, his excessive severity, and his war with the Tartars, which prevented his easing the people by lessening their taxes, created a multitude of malecontents, not only in the provinces, but in the capital.

At this juncture a Chinese in the province of Se-tchuen named Li-cong-tse, a bold and enterprising man, put himself at the head of a considerable number of rebels; and his army increasing daily, he soon took several large towns, conquered some of the provinces, and gained the affection

of the people by easing them of their taxes, by removing several magistrates, and placing in their stead others in whom he could confide, whom he ordered to treat his subjects with mildness; but on the other hand, he plundered every city that opposed him, and gave the plunder to his soldiers.

Having enriched himself with the spoils of the delightful province of Ho-nan, he entered into that of Chen-si, and there assumed the title of emperor, under the name of Tien-chun, which signifies obedient to heaven, in order to persuade the people that he was appointed by heaven to deliver them from the cruelty and oppression of the ministers.

The rebel heard of the factions and divisions which subsisted among the mandarines; he was informed that most of the troops had been sent to the frontiers of Tartary; and that several of the chief officers who remained at Peking, prevailed on by his bribes, had consented to receive him. Upon this intelligence he privately sent many of his best soldiers, disguised like merchants, into that city, and gave them money to set up shops, that they might be ready to join him when he should appear before the walls.

The success answered his expectation; for, on his marching to Peking, one of the gates was opened to him, and he entered the city in triumph, meeting only with a faint resistance from a few of the emperor's soldiers, which he immediately revenged by a cruel slaughter of the citizens. He now marched directly to the palace, and had forced the wall by which it is surrounded, before the emperor was informed of his having entered the city. That unfortunate monarch, then finding that he was betrayed, would have marched out against him with six hundred guards, who still remained with him; but he had no sooner made this proposal, than they all abandoned him: then dreading his falling into the hands of his enemies, as the greatest of all evils, he retired into a garden with his only daughter; and having wrote with his blood these words on the border of his vest, "My subjects have basely forsaken me. Spend thy rage on my body, but spare my people;" he first stabbed the princess his daughter, and then hanged himself on a tree.

The chief colao, the queens, and the most faithful eunuchs followed his example, and slew themselves. The emperor's body, after a long search, was brought before the tyrant, seated on a throne; who, after treating it with indignity, caused two of the emperor's children and all his ministers to be beheaded, but his eldest son escaped by flight.

After his death all submitted to the usurper, who, in order to establish himself on the throne, put several of the chief mandarines to death, and exacted several considerable sums from others. There was none but Ou-san-guey, general of the forces on the frontiers of Tartary, who refused to acknowledge him emperor. This general had a father called Ou, who then lived at Peking, whom the emperor sent for, and gave orders that he should follow him. He immediately put himself at the head of a considerable army, in order to reduce the Chinese general, who had retired into one of the towns in the province of Leaotong. After he had for some time carried on the siege, he ordered the general's father to be brought before the walls loaded with irons, and threatened the general, that if he refused immediately to submit and surrender the place to him, he would cut his father's throat before his face.

But Ou san-guey, preferring the good of his country to his duty and filial tenderness, suffered his father to be thus murdered, while the old man highly extolling the fidelity of his son, submitted with an heroic courage to the rage and fury of the tyrant.

This cruelty provoked the general to seek for revenge; but knowing that it would be difficult for him long to resist the efforts of the usurper, he applied to the king of Tartary, with whom he had been at war, and not only concluded a peace with him, but prevailed on him to march against the usurper with all his forces.

Tsong-te, the Tartarian prince, influenced more by ambition than by the bribes offered by the Chinese general, willingly accepted the proposal, and the very same day appeared at the head of eighty thousand men. The usurper, being informed of this union, did not dare to encounter two such great generals; but retiring in haste to Peking,

loaded several chariots with the most valuable goods he found in the palace, and then setting it on fire, fled into the province of Chen-si, where he concealed himself with such care, that the place of his retreat could never be found; though part of the plunder he carried off fell into the hands of the Tartarian soldiers. This revolution happened in the year 1644.

The young prince, being conducted to Peking, was received with great acclamations of joy; for the people looking upon him as their deliverer, nothing was heard on all sides but "Long live the emperor! may he live ten thousand years."

The exasperated Ou-san-guey found too late the error he had committed, in sending for the Tartars to chastise the tyrant, and would sometimes say, That he had brought lions to drive away dogs. He, however, received the dignity of king from the hands of Chun-tehi, with the title of peace-maker of the west, and the town of Si-ngan-fou was assigned him for his residence.

Though Chun-tehi ascended the throne at Peking with such applause, yet the southern provinces took up arms against him, and several of the grandsons of the preceding emperor aspiring to the throne perished. The Tartars, though sometimes defeated, maintained their footing in China against all who opposed them. At length a Chinese leader, of a most cruel and sanguinary disposition, ravaged the western provinces, and the storm of his fury fell on the province of Se-tchuen. He behaved with humanity to none but his soldiers, whom he treated with great familiarity. He put to death the king of the capital of the above province, and for every trifling fault committed by a single man, murdered all who lived in the same street; five thousand eunuchs were slain because one of them had not given him the title of emperor: having called fifteen thousand literati to an examination, they were no sooner assembled than he caused them all to be assassinated, under the pretence that by their sophisms they incited the people to rebel. Upon his leaving the city of Tchin-tou-tou he caused all the inhabitants to be brought out in chains, and massacred in the fields. He ordered all his soldiers to kill their women, because they were only troublesome in war, and set them an example by cutting the throats of three thousand of his own, reserving only twenty to wait on his three queens. In short, he burnt the capital of Se-tchuen, and several other towns. But as he was preparing to engage the Tartars, he was told that five warriors were seen upon the hills at some distance, he immediately went to reconnoitre them, without putting on his breast-plate; and no sooner came in sight of them than he was shot through the heart with an arrow. His army then dispersed; and the people receiving the Tartars as their deliverers, joyfully submitted to their yoke.

There were yet, however, four provinces in the south under the government of the Chinese; against which the court sent three different armies. The next year died Amavan, uncle and tutor to the emperor, who then took the government into his own hands, though he was but fourteen years of age; and after a series of successes and disappointments, at length became sovereign of all China.

Chun-tehi soon gained the love of the Chinese. Instead of imitating the Chinese emperors, by shutting himself up in his palace, he began his reign with shewing himself in public, and giving free access to his person. As he was sensible the Tartars were much inferior to the Chinese in number, he obliged the Chinese to cut off their hair, leaving only one lock on the crown of the head, and to change their habits to those of the Tartars, that it might not be discovered how few they were in comparison of the Chinese. All the Chinese soldiers who enlisted among his troops were also obliged to appear like the Tartars. But what contributed still more to the establishment of the Tartarian family, was his employing the Chinese both in civil and military affairs; he advanced the most popular of the grandees to be viceroys and governors of provinces; remitted one-third of the taxes; governed the Chinese by their own laws; and, instead of changing their language, he would not even suffer a Chinese to learn the Tartarian tongue without a particular licence.

Thus he united the Chinese and Tartars into one nation; and by this union the latter seem rather to have submitted to

to the laws of the former, than to have imposed any upon them. In reality, Tartary is become subject to China, which still holds the seat of empire, and has the supreme courts of justice. Thither flows all the wealth of the united kingdoms; and there all honours are conferred. Thus China has gained a great addition of strength from Tartary, and has now no enemy to fear. Their northern neighbours are under the same sovereign, who keeps them in such subjection, that they are no longer able to disturb the repose of the empire. Many of the petty kings of Tartary are no more than his viceroys, and the emperor has forts and garrisons throughout their whole country. In short, Tartary, instead of becoming the seat of government, is the place of banishment for the guilty, who are sent thither with their families to people those vast deserts, that the children who are born there may become accustomed to hardships, and lose the softness and pusillanimity of the Chinese, in the rougher temper and manners of the Tartars.

The emperor has an absolute authority, and the respect paid him is a kind of adoration; his commands are as readily and as strictly obeyed as if they came from heaven, nor are any admitted to speak to him but on their knees; not even his elder brother, unless it be at his command. None, except the lords who attend him, are allowed to stand in his presence; but when they speak to him, they put only one knee to the ground.

The officers receive the same honours when they represent the emperor's person, and give his orders, either as mandarines of the presence or as envoys. His governors also receive the same honours when they administer justice, because they are his representatives. Indeed such respect is paid to the emperor, that the princes of the blood, and all the the grandees of the court, not only kneel before him, but before his chair, his throne, his cloaths, and every thing made for his particular use.

Persons of the highest rank are not allowed to ride on horseback or to pass in a chaise before the gates of his palace, but are obliged to alight at a place appointed for that purpose. If the emperor falls dangerously ill it creates a general alarm, the mandarines assemble in one of the courts of the palace, and pass whole days and nights without regard to the inclemency of the air or the rigour of the season, imploring heaven on their bended knees to restore his health.

Yellow is the imperial colour, and none must wear it but the emperor and those who attend his person. His vest is adorned with dragons that have five claws: this is his coat of arms, and nobody else must bear them. He has the disposal of the lives and fortunes of his subjects, nor can any criminal suffer death till he has confirmed the sentence.

The princes of the blood are allowed a palace and a court, and have a revenue agreeable to their rank. They are obliged to live at court, but have not the least degree of power. The emperor alone disposes of all places in the empire. He nominates the viceroys and governors, and displaces them at his pleasure. He chooses which of his sons he pleases for his successor; and if he prefers to the eldest one of more distinguished merit, his name becomes immortal.

In order to preserve their reputation, the emperors are continually inquiring into the state of the empire, affecting a kind of paternal care for their people; particularly when any of the provinces are afflicted with calamities, the emperor shuts himself up in his palace, abstains from all pleasures, and publishes decrees to ease such provinces of their usual taxes.

The seals of the empire are considerable ensigns of the imperial authority, and are applied to authorize all public acts. The emperor's seal is near eight inches square, and is a very fine jasper; a precious stone so highly esteemed in China, that none but the emperor is allowed to use it. The honorary seals given to the princes of the blood are of gold; those of the viceroy, great mandarines, or magistrates of the first order are of silver; while those of the inferior mandarines are either of brass or lead, and are either larger or smaller, according to the dignity of those magistrates.

These seals are carried before the mandarines when they perform any ceremony, or visit persons to whom they would shew respect; they are then deposited in a gold box,

placed upon a kind of litter, supported by two men, who walk before the chair of the mandarine.

The revenues of the emperor are amazingly great; but it is not easy to give an exact account of them, because the annual tribute is paid partly in money and partly in commodities; it particularly arises from the produce of their lands, as rice, wheat, and millet: from salt, silks, stuffs, linen, cotton, with innumerable other articles. All these, together with the customs and forfeited estates, annually amount to above twenty-one million sterling.

The troops he constantly keeps in pay amount to above seven hundred and seventy thousand soldiers; these are stationed near the great wall, and other fortified places; a part of these also compose his guards, and those of the mandarines, whom they escort on their journeys, and at night keep watch about their barks or at their inns. The emperor likewise maintains near five hundred and sixty-five thousand horses to remount his cavalry, and for the use of the posts and couriers who convey his orders, and those of the tribunals, into the provinces.

The emperor enjoys the right of making peace and war, and he may conclude treaties upon what conditions he pleases, provided they are not dishonourable to the empire.

It might be imagined that this unlimited power would often occasion very unfortunate events; this has been sometimes the case, but not often, for so many provisions have been made by the laws, that a prince must be wholly insensible to his own reputation and interest, who continues to make an unjust use of his authority. If he has any regard to his reputation, there are several things which must induce him to govern with justice, and not from the dictates of passion. The old law-givers, from the first foundation of the government, made it a standing maxim, that kings are the fathers of their people; whence in all ages the emperor has been called the great father: a title which he is taught to prefer before all others. This idea of the prince is so deeply imprinted in the minds of the people, and of the mandarines, that whenever they make any panegyric in the emperor's praise, they always take notice of his affection to the people. Their teachers and philosophers represent in their books the state as a large family, and therefore if the prince loses sight of this maxim, though he may be a good warrior, an able politician, and a very learned man, yet he will meet with little esteem from the people.

Every mandarine may tell the emperor his faults, provided it be done with all that submission and humility that is agreeable to the veneration and profound respect which is his due. Here the mandarine, who observes any thing in the emperor's conduct inconsistent with the constitution of the empire, draws up a request, where, having expressed his profound respect for his imperial majesty, he most humbly beseeches him to reflect upon the ancient laws and good examples of the great princes his predecessors, and then takes notice in what instances he apprehends the emperor has deviated from them. This request lies upon a table among many other petitions that are daily presented, and which the emperor is obliged to read. If upon this he does not change his conduct, he is again admonished as often as the mandarine's zeal and courage will permit him to do it; for they cannot, without great danger, venture to expose themselves to his resentment.

Besides the manner in which their histories are wrote, is alone sufficient to keep within bounds any prince who has the least regard for his fame. A certain number of men, who are chosen on account of their learning and impartiality, remark with all possible exactness not only all the prince's actions, but even his words; and each of these persons takes minutes of every thing that passes, without communicating his observations to the others, and puts the papers, containing his remarks, through a chink into an office set apart for that purpose.

The emperor's virtues and vices are set down in those papers with impartiality. *In such an affair, say they, the prince stopped the sword of justice, and had the partiality to invalidate the sentence passed by the magistrates. On such a day the punishment he inflicted on a person was rather the effect of his passion, than the result of justice. Or else, At such a time, notwithstanding the commendations given him by his flatterers, he was so far from being puffed up, that his words were tempered*

pered with all possible sweetness and humility. He gave such and such marks of his love to his people.

Thus they set down every thing that occurs in his administration; but that neither fear on the one hand, nor hope on the other, may bias them to be partial in the account they give of the emperor, this office is never opened during the prince's life, or while any of his family sit on the throne. When the crown passes into another line, which often happens, all these loose memoirs are gathered together, and after having compared them, they from thence compose the history of that emperor; and if he has acted wisely, propose him as an example to posterity, or if he has been negligent of his duty, and acted inconsistently with the good of the people, expose him to the censure of the public.

The emperor has two sovereign councils; one, called the extraordinary council, is only composed of princes of the blood; the other, called the council in ordinary, has, besides the princes, several ministers of state, named Colaos who examine all state-affairs, and make their report to the emperor, by whom they are finally determined.

On particular days the mandarines go in their proper habits to salute the emperor, when, if he does not appear himself, they pay their reverence to his throne, which is the same as if done to himself in person. While they wait for the signal to enter the court before the hall in which the throne is placed, they all sit on cushions before the south gate of the palace. The court is paved with brick and is as clean as a room, and the cushions are different according to the degree of the mandarine. Those who have a right to use them, for all have not, distinguish them in the summer time by coloured silks, but the difference of the degree is chiefly shewn in the middle of the cushion. In the winter they use skins for the same purpose, which are distinguished by their value. In this multitude, among whom one might expect nothing but confusion and disorder, every thing is admirably regulated according to the most exact order; for as all know their places there are no disputes about precedence.

When the emperor goes out of his palace he is attended by a great number of the lords of his court, who make a very pompous procession. The princes of the blood and the lords lead the van on horseback, followed by the colaos or ministers of state, and the great mandarines; who ride close to the houses on both sides, leaving the middle of the street clear; these are followed by four-and-twenty standards of yellow silk, embroidered with dragons of gold; then appear twenty-four umbrellas of the same colour, and as many curious and rich fans; the horse-guards come next, dressed in yellow, wearing a kind of helmet on their head, and carrying a javelin or half pike gilt, on the top of which is either a sun, a crescent, or the head of some animal. The emperor's chair, which is very magnificent, is carried by twelve footmen dressed in the same colour. A troop of trumpeters and musicians, playing on all sorts of instruments, accompany the emperor; and the procession is closed by a multitude of footmen and pages.

The pomp with which he goes to make his offerings in the temple of Tien is still more extraordinary. The procession begins with twenty-four drums ranked in two files, and twenty-four trumpets formed of a wood greatly esteemed by the Chinese. They are about three feet long, and about eight inches in diameter at the end, adorned with circles of gold. After them follow twenty-four men in a line armed with red slaves seven or eight feet long, varnished and adorned with gilt foliage. Next to these are a hundred soldiers carrying halberts, the iron part of which terminates in a crescent. Then follow an hundred men with red races ornamented with flowers, and gilt at the end. Then advance four hundred very fine lanterns; four hundred flambeaux made of wood, which burn a long time and yield a very great light; two hundred men with spears, some adorned with tufts of silk of various colours, others with the tails of foxes, leopards, and other animals: twenty-four banners, on which are painted the signs of the zodiack, which the Chinese divide into twelve parts: fifty-six other banners, whereon are represented the fifty-six constellations, to which the Chinese reduce all the stars: two hundred fans, on which are painted various figures of dragons, birds, and other ani-

mals, these are supported by long gilt sticks; twenty-four umbrellas richly adorned, and a beaufet supported by the officers of the kitchen, and furnished with gold utensils, such as ewers, basons, &c. Then appears the emperor on horseback richly dressed, and on each side is held a magnificent umbrella, large enough to shade both him and his horse; he is surrounded with ten led horses; these are always white, with the saddles and bridles enriched with gold and jewels; and also by a hundred spearmen, and pages of the bed-chamber.

After them the princes of the blood, the reguloes, the chief mandarines, and the lords of the court appear in the same order, and in their proper habits, together with five hundred young gentlemen belonging to the palace richly clad, followed by a thousand footmen in red gowns bordered with flowers, and stars of gold and silver; immediately after thirty-six men carry an open chair, followed by another that is much larger and close, supported by a hundred and twenty chairmen; then appear four large waggon, two of which are drawn by elephants, and two by horses covered with embroidered housings; every chariot and chair is followed by a company of fifty men to guard it. This procession is closed by two thousand mandarines of letters, and two thousand mandarines of arms, or officers of war, richly dressed in their proper habits. The same order is always invariably observed.

Such is the power and grandeur of this great monarch, who is the soul that gives motion to the whole empire, and preserves all ranks in a proper subordination.

S E C T. XI.

Of the Nobility.

NONE but those who belong to the reigning family have any title of distinction: these possess the rank of princes, in whose favour five honorary degrees of nobility are established, much like those of dukes, marquises, earls, viscounts, and barons in Europe. These titles are granted to the children of the emperor, and to those to whom he gives his daughters in marriage, who have revenues assigned them equal to their dignity, but not the least power. When the founder of the present Tartarian family was settled on the throne, he conferred on his brothers, who were very numerous, and had contributed by their valour to the conquest of many countries, several titles of honour, to which the Europeans have given the appellation of reguloes or princes of the first, second, and third rank, and it was then determined, that from among the children of every regulo one should always be chosen to succeed his father in the same dignity.

The emperor also creates others of an inferior sort, which are bestowed on such of the other children as are most worthy. But though those of the fourth and fifth ranks are above the greatest mandarine in the empire, they have nothing to distinguish themselves from the mandarines, either in their habits or equipage, except their wearing the yellow girdle, which is common to all the princes of the blood as well those that possess dignities, as those who have none, but the latter hide it, and are ashamed to let it be seen, when their circumstances will not permit them to have an equipage suitable to their birth.

The princes of the royal blood are allowed a palace and a court with officers, and a revenue suitable to their rank; but have not the least authority over the people. All the princes live at court, and have houses and lands, besides the revenue they receive from the emperor.

These princes, besides one lawful wife, have generally three others, on whom the emperor bestows titles, and whose children take place next to those of the lawful wife, and are more respected than those of their concubines, of whom they may have as many as they please. They have also two sorts of servants, the one slaves, and the other Chinese or Tartars, whom the emperor bestows upon them; the latter are part of their retinue, and among these are considerable mandarines, and even viceroys, who are entirely subject to their will; and after their death become subject to their children.

Yet

Yet these princes have no other employment than making their appearance every morning at the emperor's palace, and assisting at public ceremonies: after which they return home, and have nothing to do but to govern their families; for they are not permitted to visit each other, or even to lodge out of the city without leave.

But the family esteemed the most noble in all China is that of the celebrated Confucius, of whom we shall give some account in treating of the religion of the Chinese. The honours conferred on that great man have been continued in a direct line for two thousand years in the person of one of his nephews, who is called, The nephew of the Great or the Wise Man.

The emperor sometimes bestows titles of honour upon persons of distinguished merit, and gives them for five, six, or more generations, in proportion to the services they have done the public. Sometimes, when a person has distinguished himself in an extraordinary manner, the emperor not only bestows on him these titles, but by distinct patents extends them to the father and mother, the grandfather and the grandmother of him he has honoured: or rather he bestows on each a particular title of honour in acknowledgment of the care they have taken in the education of a man of such distinguished merit. All his relations are so proud of the dignity, that they cause it to be written in several parts of their houses, and even upon the lanterns that are carried before them when they walk in the evening, which infallibly procures them great respect.

Hence it is evident, that except the family of Confucius, and the princes related to the reigning family, no person in China is noble, any farther than his merit is rewarded by the emperor; for every one is of the rank of which he judges him worthy, and all the rest are numbered among the vulgar.

The mandarines, who are the governors of provinces and cities, and, according to their different ranks, enjoy all the posts under the government, are chosen for their proficiency in learning. But the children even of those who enjoy the highest offices under the emperor, are in danger of sinking to the rank of the vulgar, and are often obliged to follow the meanest professions. It is true, the son of a mandarine may succeed to his father's wealth, but not to his dignity or reputation: he must rise by the same steps as those by which his father rose; and, by applying himself to study, be like him advanced for his learning.

S E C T. XII.

Of the different Tribunals, the Mandarines, the Honours that are paid them, their Power, and their Offices: the civil Regulations for the Administration of Justice, and the Punishments inflicted on the Guilty.

THERE are at Pekin six sovereign courts, whose authority extends over all the provinces of China, each of which has different matters under its jurisdiction.

The first supreme court, called the tribunal of the mandarines, presides over all the mandarines, watches over their conduct, and examines their good and bad qualities, that they may be rewarded or degraded by the emperor according to their deserts.

The second, called the royal treasury, has the care of the treasure, expences, and revenues of the emperor, and of raising the supplies.

The third supreme court, named the tribunal of rights, hath the superintendence of all ceremonies, of arts and sciences, of the imperial music, and its officers, and examines those who are candidates for degrees.

The fourth supreme court, called the tribunal of arms, has the management of the soldiery of the whole empire, and of all the fortresses, arsenals, and magazines of arms, and in general of every thing necessary for the defence and security of the empire.

To the fifth supreme court belongs the examination of criminals, in order to judge and sentence them as the laws require.

The sixth, and last supreme court, called the tribunal of public works, has the inspection of all public buildings, and the palaces of the emperor, princes of the blood and

viceroy. It has likewise the superintendence of the triumphal arches, towers, bridges, rivers, canals, lakes, streets, and highways.

Each of these courts is divided into several offices, the principal of which is managed by a president and two assistants, who have the final inspection of all that comes under the notice of that court, and the rest are under-officers, consisting of a president and several counsellors, all subject to the president of the principal office.

As there might be reason to apprehend that bodies invested with such power would gradually weaken the imperial authority, the laws have prevented this inconvenience, by making it necessary for each of these courts to have the assistance of another to put its decisions in execution: as for instance, the army is subject to the fourth supreme court, which is that of war, but the payment of the troops belongs to the second; and the arms, tents, and waggons come under the cognizance of the sixth court; so that no military enterprise can be put in execution without the concurrence of these different courts.

To prevent the unjust and iniquitous practices that might take place in any of these courts, there is an officer in each, who attends to all their proceedings, and, though he is not of the council, is present at all their assemblies. His office obliges him to give private information to the emperor of the faults committed by the mandarines, not only in the administration of public affairs, but in their private conduct: they even admonish the emperor himself when he stands in need of it. These public censors are extremely dreaded, and the very princes of the blood stand in awe of them.

The mandarines are nominated by the emperor, and consist of all on whom he bestows any authority in the provinces. They are governed by two general officers, on whom all the rest depend. One is the viceroy of a single province, and the other has two, and sometimes three provinces subject to him. They are both at the head of a supreme tribunal in the province where all important affairs are decided, and to them the emperor sends his orders, while they take care to transmit them to all the cities in their district.

The cities are of three different orders, and have also their governors and several mandarines who administer justice. There are likewise mandarines that have the care of the posts, with the royal inns and barks in their district. Others have the inspection of the army; others take care of the rivers; others oversee the repairing of the high-roads, and the employment of others is to visit the sea-coasts. They have also power to punish criminals, and are a kind of substitutes of the six supreme tribunals of the court.

All the mandarines are extremely fond of the ensigns of their office, by which they are distinguished not only from the common people, but from all others of the learned, especially those of an inferior rank. This mark of their dignity consists in a piece of square stuff, which they wear upon their breasts, and is richly embroidered with a device peculiar to their office. Some have a dragon with four claws, others an eagle or a sun; and the mandarines of arms bear lions, tigers, leopards, &c.

There is an absolute dependence between the several powers which govern the empire. The most inconsiderable mandarine regulates every thing within the extent of his district, but depends on other mandarines, whose power is greater, but are dependent on the general officers of every province, as these latter are on the tribunals of the imperial city, and the presidents of the supreme courts, who keep all other mandarines in awe, while they themselves tremble before the emperor, in whom resides the imperial power.

The ease with which a single mandarine governs the people is surprizing; he only publishes his orders on a small piece of paper sealed with his seal, and fixed up in places where the streets cross, and he is instantly obeyed. This proceeds from the extraordinary veneration paid him by the people. He seldom appears in public without a majestic train; he is richly dressed, and is carried in summer by four men in an open gilded chair, which in winter is covered with silk, and is attended by all the officers of his tribunal, some carrying whips, others long staves or iron chains, the noise of which make the people tremble, for they

they are naturally timorous, and know that they cannot escape correction if they venture to disobey his commands. Hence whenever he appears, the people in the streets show their respect, not by bowing, which would be thought a culpable familiarity, but by retiring on one side, standing upright with their arms hanging down; and in this posture, which they esteem the most respectful, they stand till the mandarine has passed by.

Nothing can equal the ostentatious parade with which a viceroy appears in public; for as the Chinese are ever fond of shew, it is not very surprising that so great an officer should appear with all possible pomp.

First advance two men beating upon copper basons, to give notice of his approach; then come eight ensign-bearers, having on their ensigns the viceroy's title of honour in large characters. These are followed by fourteen standard-bearers, on whose standards are the symbols of his office, as the dragon, phoenix, flying tortoise, and other animals. Then advance six officers, each bearing a board raised high, on which is written, in large golden characters, the particular qualities of this mandarine; two others bear, the one a large umbrella of yellow silk three heights above one another, and the other the case in which the umbrella is kept. Then come two archers on horseback, at the head of the chief guards: the guards armed with large hooks adorned with silk fringe: two other files of armed men, some bearing maces with long handles, and others having maces in the form of a serpent. Other guards bear sharp axes, and some are armed with scythes fixed straight to the poles. Other soldiers carry halberds; then come two porters loaded with an handsome chest, containing the seal of his office: two men beating on kettles: two officers, each with a cane to keep the crowd at a distance: two men-bearers, with gilt maces in the form of dragons, and many officers of justice; some armed with whips, or flat staves, to give the bastinado: others carrying chains, whips, cutlasses, and hangers: then come two standard-bearers and the captain who commands the company. These precede the viceroy, who is carried in his chair, surrounded by pages and footmen, with an officer near him holding up a large fan in the form of a screen. He is followed by several guards, some carrying maces, and others long handled sabres; after which come several ensigns and cornets, with many domestics on horseback, each bearing something belonging to the viceroy.

When he travels in the night-time, instead of flambeaux he has several large lanterns, on which are written the titles and quality of the viceroy, to inspire every one with the reverence which is due.

As the mandarines of cities and towns are appointed to protect the people, they must always be ready to hear their complaints. In an urgent affair they go to the mandarine's palace, and beat upon a kind of kettle-drum, which is sometimes on the side of the hall of justice, but generally out of the palace, that the people may beat upon it both by night and day. At this signal the mandarine, though ever so busy, is obliged immediately to grant the audience that is demanded; but whoever gives the alarm, unless there is some notorious act of injustice, is sure to receive the bastinado.

One of the principal offices of the mandarines is to instruct the people as the representatives of the emperor, who is considered as their common father; and therefore, on the first and fifteenth of every month, they assemble the people, and give them a kind of sermon on all the social and relative duties.

To prevent commotions among the people when they groan under oppression, the least disturbance which happens in a province is imputed to the viceroy, and if it is not immediately appeased, he is almost sure of losing his office.

The laws prescribe, that no person shall enjoy the office of mandarine of the people, either in the city where he was born, or even in the province where his family has been used to reside; and generally he does not possess the same office many years in the same place before he is removed. By this means he cannot contract any friendship with the people of the country, so as to render him partial, and not being acquainted with the mandarines that govern with him, he has the less reason to shew them favour. If he receives an employment in a province joining to his

own, he must live at least fifty leagues from it. This is because he should solely pursue the public good: if he exercised an office in his own country, he might be troubled with the solicitations of his neighbours and friends, and would probably be biased in his judgment, and do injustice to other persons; or might be influenced by a principle of revenge against those who had injured him or his relations.

This niceness they carry so far, that they will not allow a son, a brother, or a nephew to be a subordinate mandarine where his father, brother, or uncle are superior mandarines, lest they should favour each other; and either tolerate or wink at their faults; and besides, it would be very hard for a father or a brother to draw up an accusation against his son or his brother.

Every three years a general review is made of all the mandarines of the empire, when every superior mandarine enquires into the conduct of the inferior, and gives notes to every one containing praises or censures. For instance, the chief mandarine of a city of the third order has under him three or four petty mandarines, to whom he gives notes, and sends them to a mandarine of a city of the second order on whom he depends: the latter, who has under him several mandarines who govern cities of the third order, examines these notes, and either agrees to what is inserted, or adds other circumstances according to his knowledge. When the mandarine of the city of the second order has received the notes from all the mandarines of the cities of the third order, he gives his note to them, and sends a catalogue of all the mandarines in his district to the general mandarines of the province, who reside at the capital. This catalogue passes through their hands to the viceroy's, who, having examined it in private, and afterwards with the four general mandarines, sends it to court with his own remarks, that the chief tribunal may be fully acquainted with the conduct of all the mandarines of the empire, in order that they may be rewarded or punished according to their deserts.

In giving the above-mentioned notes they write under their name and title of their mandariate, that he is greedy of money, too severe in his punishments, or is too old to perform his office; that another is proud, of a capricious temper, &c.

When all the notes are arrived at Peking, the chief tribunal examines them, and sends them back to the viceroy, after setting down the reward or punishment appointed for each mandarine. Those who have bad notes are deprived of their offices, and those who are commended are raised to a superior mandariate.

But as the general officers might be bribed by the governors of the cities, and thus connive at the injustice of those who oppress the people, the emperor from time to time sends inspectors into the provinces, who go into the cities and into the tribunals, while the mandarines give audience, and secretly enquire of the people how they behave in their offices; and if he finds any irregularity, he discovers the ensigns of his dignity, declaring himself the emperor's envoy: he then immediately brings to trial the guilty mandarines, and punishes them as the laws require; or, if the injustice be not notorious, sends his informations to court, that they may determine what is to be done.

These inspectors of provinces are supposed to be possessed of the greatest integrity; yet as they may be tempted to enrich themselves at the expence of the guilty, whose injustice they may overlook, to keep them upon their guard, the emperor, when they least think of it, goes into certain provinces in person, in order to hear the just complaints of the people against their governors; and those visits make the mandarines tremble.

In one thousand six hundred and eighty-nine the emperor Cang-hi took a journey into the southern provinces, and rode on horseback, followed by his guards and about three thousand gentlemen. The people met him in the cities with standards, flags, canopies, and umbrellas. At the distance of every twenty paces they erected in the streets triumphal arches covered with the finest stuffs, and adorned with festoons, ribbons, and tufts of silks, under which he passed. This great prince, being once at some distance from his attendants, perceived an old man, who wept bitterly, and asked him the reason. Sir, replied the man, who did not know him, I had but one child, in whom I placed

placed all my happiness, and with whom I trusted the care of my family, but a Tartarian mandarine has taken him from me, so that I am deprived of all succour, and probably shall be so as long as I live; for how can a poor man, like me, oblige the governor to do him justice? This is not so difficult as you imagine, replied the emperor, get up behind me, and guide me to his house: the man obeyed without ceremony, and in about two hours time they arrived at the palace of the mandarine, who did not expect this visit. The guards and a great company of the emperor's attendants, after having long searched for him, overtook him at the mandarine's, and, without knowing what was the matter, soon surrounded the house; and others entered with the emperor, who having found the mandarine guilty of the violence of which he was accused, had his head cut off on the spot: then turning towards the afflicted father, "To make you amends, said he, I bestow upon you the office of the guilty person, who is put to death; take care to fill his place with greater moderation, and let his crime and punishment make you fearful in your turn of becoming a dreadful example to others."

In short, nothing could exceed the order established by the Chinese law, if the mandarines strictly conformed to them; but this is far from being the case; for they are not very scrupulous in violating the laws of justice and humanity in order to serve their private interest. There are no artifices to which the inferior officers have not recourse to deceive the superior mandarines; and among the latter some endeavour to impose upon the supreme tribunals of the court, and even to mislead the emperor himself. Indeed they so artfully cloak their passions, and affect in their memorials such an air of disinterestedness, that it is very difficult for the prince to avoid being deceived.

Besides, as their salaries are not always sufficient to maintain their pomp and luxury, the acts of injustice they commit, provided they are secret, are attended with no hazard. Ministers of state and the chief presidents of the supreme courts sometimes privately extort money from the viceroys of provinces, and those again, to indemnify themselves, oppress the subordinate officers, and these last reimburse themselves by their exactions upon the people. No crimes, when they are discovered, pass unpunished in China; the bastinado is the common punishment for slight faults, and the number of blows is proportioned to the nature of the offence: when these do not exceed twenty, it is esteemed a fatherly correction, and is not infamous. The emperor himself sometimes commands it to be inflicted on great persons, and afterwards sees and treats them as usual.

A small matter will incur this correction, as foul language, or fighting with the fists; for if these things reach the mandarine's ears, he immediately causes them to be bastinadoed; which being done, they must kneel before him, bow their bodies three times to the earth, and thank him for the care he takes of their education.

This punishment is performed with a split bamboo, which is a wood that is hard, strong, and heavy: the lower part is as broad as one's hand, and the upper smooth and small that it may be easily managed. The criminal is laid down with his face to the ground, his drawers are pulled over his heels, and the stripes are given over his bare posteriors.

A mandarine may cause this punishment to be inflicted wherever he is; it is sufficient for one of the poor vulgar not to dismount from his horse when a mandarine passes by, or to cross the street in his presence, to receive five or six blows by his order, which is performed with such expedition, that it is often done before those who are present perceive any thing of the matter. Masters use the same correction to their scholars, fathers to their children, and noblemen to punish their domestics, only the battoon is less.

Captain Hamilton observes, that he knew an English gentleman who underwent the chastisement of the bamboo; and upon this occasion mentions a diverting incident, which he says, he was told, happened at Amoy, where he himself was present, and where the English traded before they removed to Canton.

A mandarine, says he, going in his chair, with his usual retinue, met a sailor with a keg of arrack under his arm.

Every body went off the street but the jolly sailor, who had been tasting his arrack; yet was so mannerly as to walk aside, and give the mandarine the middle of the street; but one of the retinue gave the sailor a box on the ear, and had almost shoved him down kegs and all. The sailor damned him for a son of a whore, and asking what he meant by it, gave the aggressor a box on the ear in return. The poor seaman was soon overpowered by the retinue; but the mandarine ordered them to do him no harm, till he had sent for the English linguist, who soon came. The mandarine told the linguist what had happened, and bid him ask the sailor why he gave him that affront? The sailor swore that the mandarine had affronted him, in allowing his servants to beat him while he was walking down the street civilly, with his keg of samshew under his arm; and that he would box the mandarine, or any of his gang, for a Spanish dollar; and with that put his hand in his pocket and pulled out a dollar.

The mandarine ordered the linguist to tell him what the sailor said, and why he pulled out his money. The linguist having told him, the mandarine laughed immoderately; and, after he had composed himself, asked if the sailor would stand to his challenge, who swore he would. The mandarine had a Tartar in his retinue famous for boxing, at which he had won many prizes, and called for him to try his skill on the Englishman. The Tartar was a lusty man, and the sailor short, but well set. The Tartar promised an easy conquest, and to the combat they went. The Tartar was used to kick high at the belly, but at the first kick the sailor had him on his back. Ashamed of the foil he had received, the Tartar attacked him again; but he again tripped up his heels. He then desired to have a fair bout at boxing, without tripping, which Jack agreed to; and with his head battered the Tartar's face and breast with such force, that, to use Mr. Hamilton's words, he was forced to yield to Old England. The mandarine was so pleased with the bravery and dexterity of the seaman, that he made him a present of ten tayals of silver.

The wooden collar is a more infamous punishment. This is composed of two pieces of wood hollowed in the middle for the neck, and when it is put on the person can neither see his feet nor put his hand to his mouth; but is obliged to be fed by some other person. This disagreeable load he carries day and night: it is lighter or heavier according to the nature of the offence; some weigh two hundred pounds and some are three feet square and five or six inches thick; the common sort weigh fifty or sixty pounds.

When these two pieces of wood are in the presence of the mandarine joined about the criminal's neck, they paste on each side two long slips of paper, on which they fix a seal, that the two pieces may not be separated without its being perceived: then they write in large characters the crime for which the punishment is inflicted, and the time it is to last. For instance, if it be a thief, a seditious person, a gamester, or a disturber of the peace of families, he must wear it three months. They are generally exposed in some public place; but the criminals find various ways to ease themselves, some walk in company with their relations and friends, who support the four corners that it may not gall their shoulders; others have a chair to support the four corners, and so sit tolerably easy; and some kneel down, and placing the edge of the collar on the ground, amuse themselves with viewing the people as they pass.

At the expiration of the time of punishment, the criminal is brought back to the mandarine, who having exhorted him to behave better for the future releases him from the collar; and to take his leave of him, orders him twenty strokes with the battoon; for the Chinese never inflict any punishment, except a pecuniary one, which is not preceded and succeeded by the bastinado.

There are some crimes for which the criminals are marked on the cheek with a Chinese character, signifying their crime. There are others for which they are sentenced to draw the imperial barks; and there are others for which they are condemned to banishment.

There are three ways of punishing with death, the most honourable of which is, in their opinion, strangling, which is frequently done by a bow-string. In some places they put a cord of seven or eight feet long, with a running knot, round the criminal's neck. Two servants belonging to the

the tribunal draw it hard at each end, then loose it a moment, and drawing it again the second time, kill the criminal.

Another kind of punishment is extremely cruel: this is inflicted on rebels and traitors, on a son who strikes his father, and on merciless robbers; and is called cutting in ten thousand pieces. The executioner fastens the criminal to a post, then fleaving the skin of his head, pulls it over his eyes, and afterwards mangles him by cutting pieces from all parts of his body; and when he is weary of this barbarous exercise, he delivers him to the cruelty of the populace. But this cruel death is very seldom inflicted, for those who rob, deterred by this punishment, never murder.

The other is beheading, which is for crimes of great enormity, as murder, and is looked upon as very shameful, because the head, which is the principal part of man, is separated from the body; and because in dying they do not preserve the human form as entire as it was when they received it from their parents. The party condemned to suffer this punishment is not, on the day of execution, exposed on a scaffold, but being made to kneel in some public place, with his hands tied behind him, a person holds him so fast that he cannot move, while the executioner coming behind, takes off his head at one stroke, and at the same time lays him on his back with such dexterity, that not a drop of blood falls on his cloaths, which on that occasion are generally better than ordinary: for his relations and friends, though ashamed to own him in those unhappy circumstances, usually send him new cloaths, and cause provisions and drink to be offered him by the way.

The executioner is commonly a soldier; and his office is so far from being scandalous, that at Pekin he accompanies the criminal girt with a sash of yellow silk, and his cutlafs is wrapped in silk of the same colour, to shew that he is vested with the emperor's authority.

Those who suffer this death are also sentenced to be deprived of common burial, which in China is a most terrible infamy; the executioner, therefore, after having stripped the body, throws it into the next ditch.

The Chinese, being persuaded that such as are beheaded must have been disobedient to their parents, and that this separation of the members is a judgment that befalls them for that crime, sometimes buy the bodies of their parents or relations at a great price from the executioner, and sew on the head again with abundance of lamentations, to atone in some measure for their disobedience. The executioner, by thus selling the body, runs the hazard of being severely punished, unless he bribes the mandarine or the informer pretty high; and on this account the body often costs the relations six hundred or a thousand crowns.

The ordinary torture customary in China to oblige criminals to make a confession is extremely painful, and is inflicted on the feet and hands: for the feet they make use of an instrument which consists of three pieces of wood, one of which is fixed, and the two others move and turn upon it. The feet of the criminal being put in this machine are squeezed so violently, that they make the ankle-bone flat. They place pieces of wood between the criminal's fingers, and tying them very hard with cords, leave them for some time in this torment.

The Chinese have remedies to diminish the sense of pain; and they are said to have others, after the torture, so efficacious as to heal the criminal, who in a few days recovers the use of his limbs.

SECTION XIII.

Of the Religions in China, particularly the ancient Religion of the Chinese; of that of Confucius; of the Sects of Taoisee and of Fo; and of the Jews and Mahometans settled in China.

IT appears from the classical books of the Chinese, that they formerly worshipped the Supreme Being, as the Lord and Sovereign of all things, under the name of Changti, or supreme emperor, and Tien, which signifies the spirit which presides in heaven. They likewise paid a subordinate adoration to inferior spirits depending on the

Supreme Being, and who in their opinion preside over cities, mountains, rivers, and the like.

They maintained that, for the preservation of regularity and purity of manners, those who command should imitate the conduct of Tien, in treating their inferiors as their children, and those who obey ought to consider their superiors as their fathers.

It appears from one of their ancient books, that this Tien, the object of public worship, is the principle of all things, the father of the people, independent, almighty, omniscient; to whom the secrets of the heart are fully known, and who watches over the conduct of the universe; who is holy without partiality, a rewarder of virtue, punishing wickedness, and raising up and casting down the kings of the earth according to his pleasure: that public calamities are exhortations to the reformation of manners; and that the end of these evils is followed by mercy and goodness.

In times of public calamity the princes were not satisfied with only addressing their vows to Tien, and offering sacrifices, but carefully applied themselves to discover the secret faults which had drawn down the punishment from the Supreme Lord; they examined if they were not too expensive in their habits, too luxurious, or too fond of magnificence and splendor.

A work called the Chuking often mentions a master who presides over the government of his dominions; who has an absolute empire over the designs of mankind, and conducts them to wise and just ends; who rewards and punishes man by other men, without any abridgment of their liberty. This persuasion was so common, that princes, naturally jealous of their own honour, never attributed the success of their government to themselves, but referred it to the Supreme Governor of the universe.

It is also said in the same work, that Changti sees from the highest heavens what is done here below: that he makes use of our parents to bestow upon us the material part of our frame; but that he himself gives an understanding mind capable of reflection, which alone raises us above the rank of brutes: that to offer an acceptable sacrifice, it is not sufficient for the emperor, to whom that office belongs, to join the priesthood to the royal dignity: but that he should be upright and penitent, and before the sacrifice acknowledge his faults with fasting and tears: that Changti's councils and designs are unfathomable: that we ought not to believe that he is too exalted to attend to what is done below; for he himself examines all our actions, and has set a tribunal in our own consciences, by which we shall be judged.

Fohi, who was one of the heads of the colony which came to settle in this part of the east, and is acknowledged to be the founder of the Chinese monarchy, gave public marks of his profound veneration for the Supreme Being. He kept in a park six sorts of animals to serve as victims in his sacrifices, which he solemnly offered twice a year at the two solstices, when all the people left their employments, and joined with the prince in observing these festivals.

Chinnong, Fohi's successor, added to these sacrifices two offerings at the equinoxes; that in the spring to implore a blessing on the fruits of the earth, and that in autumn after the harvest was over, to offer the first fruits to Changti. This prince cultivated a field with his own hand, and made a solemn offering of both the corn and the fruit.

Houngti, who ascended the throne after Chinnong's death, fearing lest bad weather should hinder him from offering the usual sacrifices in the open air, erected a large temple, in which they might be offered in all seasons, and wherein he himself instructed the people in their principal duties. His successors generally followed his example; and it appears from the Chinese books, that for the space of two thousand years the nation acknowledged, revered, and honoured with sacrifices the Supreme Being and Sovereign Lord of the universe.

At length the troubles which arose in the empire, the civil wars by which it was divided, and the corruption of manners which became almost universal, had very near suppressed the ancient doctrine, when Confucius arose, and revived it, by giving fresh reputation to the ancient books.

He made a collection of the most excellent maxims of the ancients, which he followed himself, and taught to the people. He preached up a severe morality, and endeavoured to prevail upon men to condemn riches and worldly pleasures, and to esteem temperance, justice, and other virtues: he strove to inspire them with such magnanimity as to be proof against the frowns of princes, and with a sincerity incapable of the least disguise. What is most to be admired, was his preaching more by his example than by his words, whence he reaped considerable fruits from his labours; kings were governed by his counsels, and the people revered him as a saint. Yet he frequently met with reverses of fortune, which obliged him to travel from province to province, and was often reduced to such extremities, that he was in danger of starving.

Yet, far from being discouraged, he was never weary of instructing those who loved virtue. Among the many disciples that put themselves under his tuition, he taught some to reason justly, and to express themselves eloquently in public: he instructed others to form a just idea of a good government; but those for whom he had a more particular kindness he taught to govern themselves well, to improve their minds by meditation, and to purify their hearts by virtue. Human nature, said he, came from heaven most pure and perfect, but it has been corrupted by ignorance, the passions, and evil examples. It is our duty to re-instate it, and give it its primitive beauty. In order to be perfect, we must re-ascend to the point from whence we have descended; obey heaven, and follow the orders of the Sovereign Ruler; love your neighbour as yourself; never suffer your senses to be the guide of your conduct; but in all things listen to reason; it will instruct you to think well, to speak discreetly, and to act aright.

He sent six hundred of his disciples into different places of the empire to reform the manners of the people, and used frequently to say, It is in the West where the true saint is found. This sentence was so imprinted in the minds of the learned, that sixty-five years after the birth of our Saviour, the emperor Mimi sent ambassadors into the West, with strict orders to continue their journey till they should meet this saint.

It is said that about that time St. Thomas preached in the Indies, and therefore if these mandarines had followed his orders, China might, perhaps, have had the benefit of receiving instruction from that apostle; but the dangers of the sea made them stop at the first island, where they found the idol Fo, and learning the superstitions of the country, they, at their return, propagated idolatry throughout the empire.

But to return to Confucius, who seems to have carried the religion of nature as far as unassisted reason could reach. Though after his death he was revered by the greatest part of the nation as a saint, as a messenger inspired and sent by heaven to instruct mankind, and almost as a god; yet very early interpreters arose, who explained away the simplicity and purity of his doctrine, and, by introducing idle distinctions and superstitious observances, by wresting his meaning and giving false interpretations of the ancient books, they destroyed the worship due to the Supreme Being, and formed a system of religion and philosophy equally impious and absurd. This is now the religion of the learned, who, while they pay homage to the memory of Confucius, are far from following his precepts or imitating the innocence and sanctity of his life. The emperors have even ordered, that the literati should annually celebrate a festival to his honour.

The evening before this festival a butcher comes and kills a hog, and the servants of the tribunals bring rice-beer, fruit, flowers, and herbs, which they set on a table, on which are placed wax-candles and censers. The next day the governors and the several orders of the learned repair, with drums beating and hautboys sounding, to the hall of the feast, where the master of the ceremonies commands them sometimes to bend forwards, sometimes to kneel and bow their heads to the earth, and sometimes to rise and stand on their feet.

The ceremony begins with the chief mandarine's taking separately meat, rice-beer, and pulse, which he presents before the tables of Confucius, the music playing all the while to verses sung in honour of that great philosopher.

Afterwards they repeat his elogium, which are seldom more than eight or ten lines, in praise of his wisdom, knowledge, and good morals. The ceremony is concluded with repeated bows and reverences at the sound of flutes and hautboys, and reciprocal compliments among the mandarines. At length they bury the blood and hair of the animal they have offered; and burn, in token of joy, a large piece of silk fastened to the end of a pike, and hanging to the earth in the manner of a streamer. The formula is the same throughout all the cities of the empire; and these honours, which are, in effect, paid to Confucius, inspire the doctors with great emulation. They afterwards go into the second hall to pay certain honours to the ancient governors of cities and provinces, who are famous for having behaved well in their employments; and then pass into a third hall, where the names of citizens, celebrated for their virtues and talents, are exhibited, and there perform several other ceremonies.

The author of the sect of Taoisee was born two years before Confucius, his name was Laokun, and his disciples pretend that he did not come into the world till forty years after his conception. His books, which are still extant, are supposed to be much disguised by his followers; though there still remain many sentiments worthy of a moral philosopher. Among the sentences that are often repeated is one, where, speaking of the production of the world, he says, "Tao or Reason hath produced one, one hath produced two, two hath produced three, and three hath produced all things."

His morality is not unlike that of the Epicureans. It consists in avoiding vehement desires, and such passions as disturb the peace and tranquillity of the soul, and according to his disciples the wise man should pass his life free from solicitude and uneasiness, and never reflect on what is past, nor anxiously search into futurity.

Those who belong to this sect affect a calm which they say suspends all the functions of the soul, and as this tranquillity might be disturbed by the thoughts of death, they boast of having invented a liquor that has the power of rendering them immortal. They pretend to be versed in magic, and that by the assistance of the demons they invoke, they can succeed in their desires.

In the reign of the emperor Tchintsong these impostors, during a dark night, fixed a book on the principal gate of the imperial city, filled with characters and magical forms of invoking demons, and gave out that this book had fallen from heaven. The credulous prince went on foot with great veneration to fetch it, and having received it with deep humility carried it in triumph into the palace, and inclosed it in a gold box, where it was carefully preserved.

Those of this sect sacrifice to the spirit of darkness a hog, a fish, and a bird; they drive a stake into the earth, and trace upon paper an odd kind of figures, accompanying the stroke of their pencil with frightful grimaces and horrible cries. They practise divination, and pretend to heal diseases, and to drive away demons. The successors of the head of this sect are honoured with the dignity of chief mandarines, and reside in a town of the province of Kiang-si, where they have a magnificent palace, to which a great number of people flock from the neighbouring provinces, to procure remedies for their diseases, or to learn their destiny, and what is to happen during the remainder of their lives; they there receive a billet filled with magical characters, and return home well satisfied without complaining of the sum they pay for this singular favour.

We shall now give an account of the sect of Fo, or Foe. The ambassadors sent to the West, as already mentioned, having transported the idol Fo into China, and with it a corruption of the fables with which the Indian books are filled, that religion spread through the empire.

Fo lived and died in India, where he was first worshipped as a god, and his doctrines spread through all the East. The Chinese call his priests Hochang, the Tartars, Lamas; the Siamese, Talapouns, and the Japanese, Bonzes. His disciples did not fail to disperse a great number of fables after his death, and easily persuaded the simple and credulous, that their master had been born eight thousand times; that his soul had successively passed through different animals, and that he had appeared in the figure of and ape, a dragon, an elephant, &c. Thus this pre-

tended god was worshipped under the shape of various animals, and the Chinese built several temples to many different idols.

The bonzes of China say, there is a great difference between good and evil, and that after death the good will be rewarded and the wicked punished; that man ought not to kill any living creature, or take what belongs to others, not to be guilty of impurity, to forbear lying, and to drink no wine. But especially they must be kind to the bonzes, procure them the necessities of life, build them monasteries and temples, that by their prayers and penances the sins of the people may be expiated. At the funeral obsequies of your relations, say they, burn gilt and silver paper, and garments made of silk, and these in the other world shall be changed into gold, silver, and rich habits: by this means your departed relations will enjoy every thing necessary, and be able to reconcile the eighteen guardians of the infernal regions, who, without these bribes, would be inexorable. If you neglect these commands you must expect nothing after death but to become a prey to the most cruel torments; while your soul, by a long succession of transmigrations, shall pass into the vilest animals, and you appear in the form of a mule, a horse, a dog, a rat, or some more contemptible creature.

The many Chinese, who believe the doctrine of the transmigration of souls, are dupes of the bonzes, who find this opinion of great use in raising charitable contributions, and enlarging the revenues; and from this they find means to practise many frauds upon the people. Le Comte says, that two of those bonzes seeing in the yard of a rich peasant two or three large ducks, prostrated themselves on their faces before the door, and sighed and wept bitterly. The good woman seeing them from her chamber window, came down to learn the cause of their grief. We know, said they, that the souls of our fathers have passed into the bodies of those creatures, and our fear lest you should kill them, will certainly make us die with grief. I own, said the woman, we intended to sell them, but since they are your fathers, I promise to keep them. This was not what the bonzes wanted. But, continued they, perhaps your husband will not be so charitable, and then if any accident should happen to them, you may be sure it will kill us. At length, after a long discourse, the good woman was so far moved with their pretended grief, that she committed the ducks to their care. They took them with great respect, prostrated themselves before them twenty times; but that very evening made a feast of them for some of their society.

As they cannot trick people every day in this manner, they endeavored to get money from them, by doing public acts of penance, for which they are highly esteemed by the people, who shew them much pity and compassion: some drag after them a long iron chain fastened to the neck or legs; crying at every door, thus we expiate your faults, and sure this deserves an alms. Others in public places beat their head against a stone till they are almost covered with blood. They have several other acts of penances, but that which follows appears most extraordinary.

One day, says the last mentioned author, I met in the middle of a town a young bonze, whose genteel and modest look might excite any one's compassion. He stood upright in a kind of a sedan, the inside of which was full of nails with their points sticking towards him, so that he could not move without being wounded. Two fellows carried him from house to house, while he endeavoured to move the compassion of the people, by telling them he was shut up in that chair for the good of their souls, and was resolved never to leave it till they had bought all the nails, which amounted to above two thousand, at six-pence apiece; but that the very smallest of them would bring incomparable blessings on them and their families. That by buying them they would do an action of distinguished virtue, since these alms were not bestowed on the bonzes, to whom they might find other opportunities of being charitable, but on the god Fo, to whom they were going to build a temple.

As I then happened to pass by, he told me the same story, upon which I exhorted him to leave his prison and go to the temple of the true God in order to be instructed in heavenly truths; but he calmly replied, he was much obliged to me for my good advice, and would still be more so if I

would buy a dozen of his nails, which would certainly procure me a good journey. Here, hold your hand, said he, and take these upon the faith of a bonze, they are the very best in my sedan, for they prick me the most; yet you shall have them at the same rate as the others. He spoke these words in such a manner as would on any other occasion have made me laugh, but his blindness filled me with compassion, and I left him.

Some of these wretches are so far from being penitents that they are guilty of the most detestable crimes and horrid murders. The wisest part of the people are upon their guard against them, and some of the magistrates look upon them with an eye of suspicion. A governor of a town passing through the highway with his train, and seeing a great company of people, had the curiosity to send in order to know the occasion of this assembly. The bonzes were solemnizing an extraordinary festival, and had set a machine upon a stage, at the top of which a young man looked over a small rail that surrounded the machine. His arms and his body were concealed, and nothing seemed at liberty but his eyes, which he rolled about as if distracted. Below the machine an old bonze stood on the stage, who told the people that the young man was going to sacrifice himself by plunging headlong into a deep river which ran by the side of the road. He cannot die, added the bonze, if he would, because at the bottom of the river he will be received by charitable spirits, who will give him a kind reception. This is the greatest happiness that can befall him; an hundred persons have desired to sacrifice themselves in his stead, but on account of his zeal and other virtues we preferred him before the rest.

The mandarine observed that the young man had great courage, but he wondered that he himself did not tell the people of his resolution; and bid him come down that he might talk with him. The bonze was confounded and strove to hinder it, protesting the whole sacrifice would be ineffectual if he spoke a word, and that for his part he could not answer for the mischief it might bring upon the whole province. As for the mischief, replied the mandarine, I will be answerable for that, and then ordered the young man to come down, but he gave no other answer than by his frightful looks, and various distortions, his eyes rolling as if they would start out of his head. You may from hence, said the bonze, judge of the violence you offer him by this command; he is already almost distracted, and if you insist upon his coming down you will make him die with grief. Upon this the mandarine ordered some of his retinue to go up and bring him down. They found him tied and bound on every side, with a gag in his mouth, and they had no sooner untied him, and taken out the gag, than he cried out aloud, O my Lord, revenge me of those assassins who are going to drown me! I am a student, and was going to the court at Pekin to assist at the examinations, but yesterday a company of bonzes seized upon me by violence, and early this morning bound me to this machine, and took from me the power of crying out or complaining; for this evening they intended to drown me, and were resolved to accomplish their cursed ceremonies at the expence of my life.

He no sooner began to speak than the bonzes moved off, but the officers of justice, who attended the governor, stopped several of them. He who had just before pretended that the young man could not be drowned was immediately thrown into the river, where he instantly perished, and the others were carried to prison, and afterwards received the punishment they deserved.

These wretches to preserve their sect purchase children of seven or eight years old, instruct them in their mysteries, and make them young bonzes; but they are generally very ignorant, and there are few who understand the doctrines they profess.

The bonzes are of different degrees; for besides those employed in collecting alms, a small number of them gain the knowledge of books, speak politely, and employ themselves in visiting the learned, and insinuating themselves into the favour of the mandarines. Though they have not a regular hierarchy, they have their superiors, whom they call great bonzes, and this rank adds to the reputation they have acquired by their age, gravity, meekness, and hypocrisy.

In every province are certain mountains on which are idol temples that have greater credit than the rest. The people go far in pilgrimage to them, and when they are at the foot of those mountains prostrate themselves at every step they take in ascending. Those who cannot go on pilgrimage, desire some of their friends to purchase a large printed sheet of the bonzes. In the middle of the sheet is the figure of the god Fo, and upon his garment and round about it are a multitude of small circles. The devotees also hang on their necks, and round their arms, a kind of bracelet composed of an hundred beads, and eight large ones. On the top is one of an extraordinary size. When they turn these beads upon their fingers, they pronounce these mysterious words, O mi to Fo, the signification of which they themselves do not understand. They make above an hundred genuflexions, and then draw one of these red circles upon the paper. From time to time they invite the bonzes to come to the temple to pray and to authenticate by their seal the number of circles they have drawn. This they carry in a pompous manner to funerals in a small box sealed up by the bonzes, and call it a passport for travelling from this life to the next. This passport costs them a considerable sum; but they say they ought not to complain of the expence, because they are sure of a happy journey.

In some cities are several societies of ladies, who are commonly of a good family, and advanced in years, and consequently have money to dispose of. They are superiors of the society in turns, and it is generally at the superior's house that the assemblies are held. Whenever they meet, a bonze pretty well advanced in years is president of the assembly, and sings hymns to the god Fo, the devotees join in the concert, and after having several times cried O mi to Fo, and beaten some small kettles, they sit down to table and regale themselves.

On solemn days they adorn the house with idols placed in order by the bonzes, and with grotesque paintings represent the torments of hell. The prayers and feast last seven days, during which their principal care is to prepare and consecrate treasures for the other world. For this purpose they build an apartment with paper painted and gilt, containing every part of a perfect house: this they fill with a great number of pasteboard boxes, painted and varnished, in which are represented ingots of gold and silver, made of gilt paper. Of these there are several hundreds designed to redeem them from the dreadful punishments which the king of the infernal regions inflicts on those who have nothing to give him; and a number of them by themselves, to bribe his officers, the rest, as well as the house, are for lodging, boarding, and buying some office in the other world. All these little boxes are fastened by padlocks of paper, and then shutting the doors of the paper house, they secure it with locks of the same substance. When the person who has been at the expence happens to die, they burn the house with much ceremony, and afterwards both the keys of the house and of the little chests, that the good woman in the other world may be able to open them, and take out the gold and silver after the paper is turned into those metals.

All that has been hitherto mentioned relates only to the exterior doctrine of Fo, but as to the interior very few of the bonzes themselves are capable of understanding its mysteries. They teach that a vacuum or nothing is the beginning and end of all things; that from this nothing all things were produced, and to it shall return; and that all beings, both animate and inanimate, differ from each other only in their form and qualities. In order to live happily we must continually strive, say they, by meditation and frequent victories over ourselves, to become like this principle, and to that purpose must accustom ourselves to do nothing, to wish for nothing, and to think of nothing. The nearer a man approaches to the nature of a stone, or the trunk of a tree, the greater is his perfection. In short it is in indolence and in inactivity, and in a cessation of all desires, and annihilation of all the faculties of the soul, that virtue and happiness consist. When a man has once attained this state, all his transmigrations are at an end, he has nothing to fear, because properly he is nothing, or, if he is any thing, he is happy.

The greatest part of the learned, and particularly the disciples of Confucius, have warmly attacked this doctrine,

proving that this apathy, or rather monstrous stupidity, overtuned all morality; that man is raised above other beings only by his thinking and reasoning faculties, and by his application to the knowledge and practice of virtue; that to aspire after this foolish inactivity is renouncing the most essential duties; abolishing the necessary relation of father and son, husband and wife, prince and subject; and that if this doctrine was followed it would reduce all the members of the state to a condition much inferior to that of the brutes.

Though the mandarines are men of letters, and detest the idols of Fo and Tao; yet when there is a great drought, too much rain, or the country is ravaged by locusts, they endeavour to please the people by having recourse to these idols, and do not omit paying solemn visits to the temples, which, contrary to their custom, they perform on foot, sometimes negligently dressed, and their shoes made of straw. They are accompanied by the subordinate mandarines and principal persons of the city; but on their arrival at the temple, they only light up two or three small sticks of incense, and then sitting down, drink tea, smoke, and having spent an hour or two in chatting, retire.

Thus they treat the image with little ceremony; but if the favour they want be too long delayed, they sometimes cause the idol to be well cudgelled. In the province of Chan-si, an idol being long addressed in vain to send rain, they became exasperated at its obstinacy, and it was beat to pieces by order of the officers; but afterwards having wet weather they made another image, which they might easily do, as they are made of clay, or a kind of mortar, and taking it in triumph to the temple, placed it in the room of the idol they had destroyed, and presented their offerings before it.

The viceroy of a province acted with little less ceremony; for being exasperated at the idol's paying no regard to his reiterated prayers, he sent an inferior mandarine to tell the image from him, that if there was no rain by such a day he would drive it out of the city, and level its temple with the ground. The viceroy intending to keep his word, forbade the people to carry their offerings to the idol, ordered the temple to be shut up, and the gates secured. This was immediately done, but the rain falling a few days after, the viceroy's anger was appeased, and the senseless image permitted to be worshipped as before.

Indeed there are no marks of contempt, which, on these occasions, both the mandarines and the people do not shew to these impotent gods. Le Compte observes, that they sometimes address them in the most rude and reproachful terms, crying, "Thou dog of spirit, we give thee a lodging in a magnificent temple; we gild thee; we present thee food; we offer thee incense; yet after all thou art so ungrateful as to refuse to grant our requests." Then tying the image with cords they pluck it down, and drag it along the streets through all the mud, to punish it for all the expence of incense they have thrown away upon it; but if, in the mean time, they obtain their requests, they instantly, with much ceremony; wash the idol clean; carry it back, and replace it in the niche where it stood before: then falling down before it, apologize for what they have done. "Indeed, say they, we were a little too haughty, and thou wert too long in bestowing thy favours. Why dost thou bring this treatment on thyself? But what is done cannot be helped; let us therefore think of it no more: if thou wilt forget what is past, we will once more cover thee with gold."

How amazingly stupid! How unworthy is this conduct of rational beings! What absurd, what contemptible ideas do they entertain of the pretended gods to whom they offer up their adorations! But when reason is laid aside, man ceases to be rational.

We shall now mention two other foreign religions, of a very different nature, that have long been tolerated in China.

At Kay-fong-fu, the capital of Ho-nan, is a synagogue of Jews, who have been settled many centuries in China: they were visited in the year 1704, by a missionary named Cozani, who had a long conference with them. They shewed him their religious books, and permitted him to enter the most secret place of the synagogue, reserved only for the ruler, who never goes into it, but with the most profound

found reverence. In the midst of the synagogue was a very handsome pulpit, which stood very high, and had a cushion richly embroidered; there they every Saturday read in the book of the Pentateuch. There was also a tablet, on which was written the emperor's name; but there were no statues or images. There were likewise a censer, a long table, and some candlesticks. On several other tables were thirteen tabernacles, in the form of an ark, with curtains before them; twelve represented the tribes of Israel, and the thirteenth Moses, whose Pentateuch was shut up in each of them. On leaving the synagogue Cozani entered a large saloon, in which were only a great number of censers; and they told him, this was the place in which they honoured the great men of their law. From thence he was conducted to the hall of guests, in order to discourse with them; and here, on comparing his Bible with their Pentateuch, he found both the chronology and the descents of the patriarchs, with their ages, exactly agree. This synagogue looks to the west, to which they turn whenever they pray to God, whom they worship under the names of Creator of all things, and Governor of the universe. They call the law the law of Israel, the ancient law, and the law of God. Cozani prevailed on the ruler to let the curtains of one of the tabernacles be undrawn, and to unfold one of the books, they being written on long pieces of parchment and rolled round a piece of wood. The character was very distinct and clear; but one of the books having narrowly escaped an inundation when the Yellow river overflowed its banks, it happened to get wet, and some of the characters being half effaced, the Jews caused the above-mentioned twelve copies to be transcribed from it. They want several books of the Old Testament, and some they are not at all acquainted with.

Cozani was surprized to find that their ancient rabbies had blended several ridiculous tales with the facts related in Scripture; for besides the Bible they have several other books, composed by the antient rabbies: some of these, which contain the most extravagant stories, comprehend their ritual and the ceremonies they now use.

They still retain some of the ceremonies of the Old Testament; in particular they practise circumcision, and observe the seventh day, the feast of unleavened bread, and of the paschal lamb. They make no fires, nor dress any provision on their sabbaths; and whenever they read the Bible in their synagogue, they cover their face with a transparent veil, in memory of Moses, who descended from the mountain with his face covered: they also abstain from blood, and cut the veins of the animals they kill that it may all flow out.

Yet, notwithstanding this, they pay the same honours to Confucius as the Chinese literati. They join with them in the ceremonies performed in the halls of their great men, pay the honours due to their ancestors in the hall contiguous to the synagogue, and offer them the flesh of animals, except swine, with sweet-meats and incense, prostrating themselves on the earth. They used only censers, without either inscriptions or images, in the houses and halls of their ancestors. When Cozani spoke to them of the life and actions of the Messiah, they seemed greatly surprized, and said that they had never heard of any Jesus, except the son of Sirach mentioned in their Bible; they also told him, that their ancestors first appeared in the empire of China, in the dynasty of Han, which began two hundred and six years before the birth of Christ, and ended two hundred and twenty after the Christian era. There were once many families of them, but they are now greatly reduced.

There are also many Mahometans, who have been settled above six hundred years in several provinces, where they have their mosques, and are never disturbed, because they live peaceably without opposing the customs or religion of the country.

S E C T. XIV.

Of the Money, Weights, Measures, and Trade of China.

SILVER and copper are the only metals current in China in purchasing necessaries and in trade. Gold is not considered there as money, but is like precious

stones in Europe; for it is bought like other merchandize, and the Europeans draw considerable profit from this article of commerce.

Even silver is not coined, but is cut into great or small pieces as occasion requires; its value being determined by the weight, and not by the image of the prince. The Chinese generally carry with them a pair of small scales in a Japan case, not unlike the Roman balance: they are composed of a small plate, an ivory or ebony beam, and a sliding weight. The beam, which is divided into small parts, upon three different faces, is suspended by a string of silk at one of its ends, that they may easily weigh all sorts of weight. These scales are very exact, for the thousandth part of a crown piece will sensibly turn the scale.

Their silver is not equally fine, but is divided into an hundred parts, just as we account twenty-four carats to be the finest gold. Eighty is reckoned the basest alloy, and will not pass without augmenting the weight in proportion to the value of the commodity; but that from ninety to one hundred, which is the finest sort, passes currently.

The Chinese are very skilful in forming a judgment by the sight of the fineness of the silver, and are seldom deceived. The difficulty lies in purchasing small matters; for sometimes they are forced to put it in the fire, and beat it thin with a hammer, that they may the more easily cut it into little pieces, and give the price agreed upon; whence they are always longer in making the payment than the purchase.

They are sensible that it would be more convenient to have money coined of a determined value, but they are afraid that it would be a temptation to clippers and coiners; whereas there is now no danger, because they cut the silver as they have occasion to pay for what they buy.

Copper money is the only sort that has any character stamped upon it; but it has not the impression of the emperor's head, it being deemed disrespectful to the majesty of that prince for his image to be perpetually passing through the hands of tradesmen and the dregs of the people. The inscriptions on this coin are generally the pompous titles given by the emperor to the different years of his reign: as *The supremely peaceful*; *The eternally shining*; *The glorious*. These little pieces are of use in buying things of small price. It is in little round pieces, with a square hole in the middle, which they put on strings by hundreds and sometimes a thousand on one string. The metal is neither pure nor beaten, and six of the pieces are worth about a half-penny.

These small pieces have always been the current money of China, and the curious preserve some that were coined in the first dynasties of the empire, and have either passed from family to family, or have been found in the ruins of houses and cities.

It is easy to judge, that if the silver was coined in China as well as the copper, it would be greatly debased, since their small pieces of copper are often counterfeited. Those who follow this trade mark the counterfeit coin with the same characters that are seen upon the true; but the metal they use is of a baser sort, and the weight less. If they happen to be discovered the crime is capital, but some princes have been contented with cutting off the hand of the offenders, and others with sending them into banishment.

There were antiently much smaller pieces of money, which are now no longer in use; but those who happen to get any of them into their possession, beat them with a hammer till they are as broad as the current coin, and putting them upon a string among the rest they pass unperceived by the merchant: nay some, it is said, have gone so far as to cut pasteboard in the same form and to mix them with the rest upon a string, and the deceit is not discovered till the pieces are taken off.

Mr. Hamilton, in his *New Account of the East Indies* observes, that though these are the only coin, accounts are kept in tayals, macies, and condereens; ten condereens to a macie, and ten macies to a tayal; and that the value of the small brass coin above-mentioned often rises, and falls.

For the better understanding the value of money, it must be observed, that the Chinese divide their pound into sixteen leang or ounces; the leang into ten parts, called tien; the tien into ten fuen, and the fuen into ten li of silver.

silver. The beam of the Chinese scales carries these divisions no farther; and yet in relation to gold and silver of a considerable weight, the divisions extend in the same decimal proportions to imperceptible parts: on which account it is scarce possible to convey a just idea of them in our language; they divide the li into ten wha; the wha into ten se; the se into ten sou; the sou into ten tehin; the tehin, which signifies a grain of sand, into ten ya; the ya into ten miao; the miao into ten mo; the mo into ten tium; and the tium into ten fun.

Measures are said to have been invented as early as the reign of the third emperor. A grain of millet was taken to determine the dimensions of a line, or tenth part of an inch; and ten inches to a foot: but these grains being of an oval form, the various ways of ranging them have occasioned a diversity in the measures of different provinces.

At present there are three sorts of measures: 1. The foot of the palace is to the Paris foot, as ninety-seven and a half to an hundred of the feet used in the tribunal of the mathematics. 2. The foot of the tribunal of public works, used by workmen, is shorter by one line than the Paris foot. 3. The taylor's foot, which is also used by the mercers, is seven lines larger than that of the tribunal of public works.

The first being the measure constantly used by the missionaries in surveying the empire, Thomas, the Jesuit, found a degree to be two hundred lies, or Chinese furlongs, each consisting of one hundred and eighty Chinese fathoms of ten feet.

We shall now take a view of the trade of China, where the riches peculiar to each province, and the facility of conveying merchandize by means of the rivers and canals, have always rendered the domestic trade of the empire extremely flourishing and immensely great. Du Halde says, that it is much greater than that of all Europe. "That might be," says the baron De Montesquieu in his Spirit of Laws, if our foreign trade did not augment our inland commerce. Europe carries on the trade and navigation of the other three parts of the world; as France, England, and Holland, do nearly that of Europe."

As to its foreign trade, if compared to this, it is very inconsiderable, for by sea they never pass the Streights of Sunda, their farthest voyage that way being to Batavia; on the side of Malacca it never extends beyond Achen; and the limits of their navigation northwards is Japan.

They commonly sail to this last country in June or July at farthest; but first carry goods to Cambaya, or Siam, and freight themselves there with such as are in request at Japan, making two hundred per cent. by the voyage. If they sail directly thither from the ports of Canton, Emouy, or Ning-po, they export ginseng, birthwort, rhubarb, mirabolan, buffalo and cow hides, areca bark, and white sugar; gaining by the last sometimes a thousand per cent. All sorts of silk, chiefly sattins, taffeties, and damasks of different colours, but principally black; silk strings for instruments, eagle and sandal wood, which is in much request among the Japanese for perfumes, as they frequently offer incense to their idols, and European cloths and camblets.

The Chinese traders in return bring from Japan pearls, by which they sometimes gain a thousand per cent. fine copper in bars, also wrought copper, as scales, basons, chafing-dishes, incense-pans, &c. flowered paper, beautiful porcelain, Japan cabinets, and other goods; gold, which is very fine, and a certain metal called tombac, by which they gain fifty or sixty per cent. at Batavia.

They carry to Manila a great deal of silk, particularly striped and flowered satin of different colours, embroidery, carpets, cushions, night-gowns, tea, China-ware, Japan works, drugs, &c. by which they generally gain fifty per cent. and bring back only piasters. The trade they most regularly carry on is that to Batavia, to which they carry fine green tea, China-ware, leaf-gold, and gold thread made of gilt paper. Some of this is sold by hand in small scales, and is dear, because covered with the finest gold; but that brought by the Chinese to Batavia is sold only by weight, and is made up in parcels, with large hanks of red silk put in to set off the colour of the gold and increase the weight of the parcels. This the Dutch sell to the Malaysians for great profit. Toutenack,

a metal between tin and iron, that yields an hundred, and sometimes an hundred and fifty per cent, drugs, particularly rhubarb, copper vessels, as large as kettles, chafing-dishes, basons, &c.

From Batavia they import silver in piasters, nutmegs, cloves, pepper, and other spices; tortoise shells, of which the Chinese make very neat toys, as snuff-boxes, after the fashion of those in Europe; pipes, knife-handles, cups, boxes, and combs; sandal wood and black wood for making cabinet work, and Brazil wood for dying; agate stones ready cut, yellow amber, and European cloth, which they afterwards sell at Japan.

This is the principal foreign trade carried on by the Chinese; they sometimes sail to Achen, Malacca, Ihor, Potana, Ligor, Cochin-china &c. The trade they carry on at Ihor is the most easy and gainful; from thence they export cinnamon, pepper, birds-nests, rice, camphire, rattan, torches made of the leaves of certain trees which burn like pitch, gold, tin, &c.

As for the trade carried on by the Europeans in China, they have the liberty of scarce any port but that of Canton; nor do they sail up the river as far as that city, but cast anchor at Hoang-pou, about four leagues below it, where the river is crowded by a multitude of vessels; but there is no trading to advantage with any thing but silver in China, where considerable profit may be made by purchasing gold with it.

The gold bought at Canton comes partly from the provinces of China, and partly from foreign countries, as Japan, Cochin-china, and other places. The goods purchased there of the Chinese are silks, japaned works, and in much greater quantities all the different sorts of tea drank in Europe; and China-ware, hanging paper, fans, drugs, &c.

We shall conclude this description of China with an extract of the character given of the Chinese by the ingenious author of Commodore Anson's Voyage round the World; which we choose to insert here, both on account of our thinking it extremely just, and as it will serve as a summary of the whole, and, in one view, afford a just idea of that people. After which we shall describe the isles of Formosa and Hainan, which are in part under the subjection of China, and are the only islands subject to that empire that are worthy of a particular description.

"That the Chinese are a very ingenious and industrious people, is sufficiently evinced from the great number of curious manufactures which are established amongst them, and which are eagerly sought for by the most distant nations; but though skill in the handicraft arts seems to be the most valuable qualification of this people, yet their talents therein are but of a second rate kind; for they are much outdone by the Japanese in those manufactures which are common to both countries; and they are in numerous instances incapable of rivalling the mechanic dexterity of the Europeans. Indeed, their principal excellency seems to be in imitation; and they accordingly labour under that poverty of genius which constantly attends all servile imitators. This is most conspicuous in works which require great truth and accuracy; as in clocks, watches, fire-arms, &c. for in all these, though they can copy the different parts, and can form some resemblance of the whole; yet they never could arrive at such a justness in their fabrick, as was necessary to produce the desired effect. If we pass from those employed in manufactures to artists of a superior class, as painters, statuary, &c. in these matters they seem to be still more defective; their painters, though very numerous, and in great esteem, rarely succeeding in the drawing or colouring of human figures, or in the grouping of large compositions; and though in flowers and birds their performances are much more admired, yet even in these some part of the merit is rather to be imputed to the native brightness and excellency of the colours, than to the skill of the painter; since it is very unusual to see the light and shade justly and naturally handled, or to find that ease and grace in the drawing which are to be met with in the works of European artists. In short, there is a stiffness and minuteness in most of the Chinese productions, which are extremely displeasing: and it may perhaps be truly asserted, that these defects in their arts are entirely owing

“ to the peculiar turn of the people, amongst whom nothing great or spirited is to be met with.

“ If we next examine the Chinese literature, (taking our accounts from the writers who have endeavoured to represent it in the most favourable light) we shall find, that on this head their obstinacy and absurdity are most wonderful; since though, for many ages, they have been surrounded by nations to whom the use of letters was familiar, yet they, the Chinese alone, have hitherto neglected to avail themselves of that almost divine invention, and have continued to adhere to the rude and inartificial method of representing words by arbitrary marks; a method which necessarily renders the number of their characters too great for human memory to manage, makes writing to be an art that requires prodigious application, and in which no man can be otherwise than partially skilled; whilst all reading and understanding of what is written is attended with infinite obscurity and confusion, as the connection between these marks, and the words they represent, cannot be retained in books, but must be delivered down from age to age by oral tradition: and how uncertain this must prove in such a complicated subject, is sufficiently obvious to those who have attended to the variation which all verbal relations undergo when they are transmitted through three or four hands only. Hence it is easy to conclude, that the history and inventions of past ages, recorded by these perplexed symbols, must frequently prove unintelligible; and consequently the learning and boasted antiquity of the nation, must in numerous instances, be extremely problematical.

“ However, we are told by many of the missionaries, that though the skill of the Chinese in science is confessedly much inferior to that of the Europeans, yet the morality and justice taught and practised by them are most exemplary: so that, from the description given by some of these good fathers, one should be induced to believe, that the whole empire was a well governed affectionate family, where the only contests were who should exert the most humanity and social virtue. But the behaviour of the magistrates, merchants, and tradesmen at Canton, sufficiently refutes these jesuitical fictions. Besides, as to their theories of morality, if we may judge from the specimens exhibited in the works of the missionaries, we shall find them frequently employed in recommending a ridiculous attachment to certain frivolous points, instead of discussing the proper criterion of human actions, and regulating the general conduct of mankind to one another, on reasonable and equitable principles. Indeed, the only pretension of the Chinese to a more refined morality than their neighbours, is founded not on their integrity or beneficence, but solely on the affected evenness of their demeanor, and their constant attention to suppress all symptoms of passion and violence. But it must be considered, that hypocrisy and fraud are often not less mischievous to the general interests of mankind, than impetuosity and vehemence of temper: since these, though usually liable to the imputation of imprudence, do not exclude sincerity, benevolence, resolution, nor many other laudable qualities. And perhaps, if this matter was examined to the bottom, it would appear, that the calm and patient turn of the Chinese, in which they so much value themselves, and which distinguishes the nation from all others, is in reality the source of the most exceptionable part of their character: for it has been often observed by those who have attended to the nature of mankind, that it is difficult to curb the more robust and violent passions, without augmenting, at the same time, the force of the selfish ones: so that the timidity, dissimulation, and dishonesty of the Chinese may, in some sort, be owing to the pompousness and external decency so universally prevailing in that empire.

“ Thus much for the general disposition of the people: but I cannot dismiss this subject without adding a few words about the Chinese government, that too having been the subject of boundless panegyric. And, on this head, I must observe, that the favourable accounts often given of their prudent regulations for the administration of their domestic affairs, are sufficiently confuted by their transactions with commodore Anson; as we have seen

“ that their magistrates are corrupt, their people thievish, and their tribunals venal and abounding with artifice. Nor is the constitution of the empire, or the general orders of the state, less liable to exception; since that form of government, which does not in the first place provide for the security of the public against the enterprizes of foreign powers, is certainly a most defective institution: and yet this populous, this rich and extensive country, so pompously celebrated for its refined wisdom and policy, was conquered about an age since by a handful of Tartars; and even now, through the cowardice of the inhabitants, and the want of proper military regulations, it continues exposed, not only to the attempts of any potent state, but to the ravages of every petty invader.”

SECT. XV.

Of the Island of FORMOSA.

Its Situation, Climate, Vegetables, and Animals. The Treachery of the Chinese. A Description of the Part possessed by that Nation, and of the Persons, Dress, Manners, and Customs of the Natives under their Subjection. Of the Settlement made there by the Japanese, afterwards by the Dutch, and at length by the Chinese, who obliged the latter to leave the Island.

THE island of Formosa is situated to the east of China, near the province of Fo-kien, and is divided into two parts by a chain of mountains, which runs through the middle, beginning at the south coast and ending at the north. That part of the island which lies to the west of the mountains belongs to the Chinese, and is situated between 22 degrees 8 minutes and 25 degrees 20 minutes north latitude.

The word Formosa signifies beautiful, and the island well deserves the name, it being a very fine country. The air is pure and always serene, and that part possessed by the Chinese produces plenty of corn, rice, and other grain, and is watered by many rivers that descend from the mountains; but the water is not very good. Most of the fruits that grow in the Indies are to be found here, as oranges, papayas, goyavas, ananas, bananas, cocoes, &c. Besides peaches and apricots, pomegranates, grapes, figs, chestnuts, and other European fruits. The inhabitants also cultivate a kind of water-melons, much larger than those of Europe: some of these consist of a white and others of a red pulp, and contain a cool luscious juice; very grateful to the Chinese. Sugar and tobacco grow here extremely well, and all the trees in that side of the island are so agreeably ranged, that when the rice is, as usual, transplanted in lines and squares, the whole southern part resembles a vast garden.

There are no tigers, leopards, bears, wolves, nor wild boars to be met with here as in China. Horses, sheep, goats, and even hogs are very scarce; but deer and asses are seen in herds. They have abundance of oxen, which, for want of mules and asses serve for common riding, and, being disciplined betimes, go as good a pace as the best horses in the country. There are but few birds, the most common are the pheasants, but those the fowlers will scarce suffer to multiply.

The inhabitants of the eastern part of the island are described by the Chinese as barbarians; yet they acknowledge that they are chaste, of a sweet and gentle disposition, loving and mutually assisting each other; disinterested and setting little or no value on their gold and silver, of which they are said to have several mines. But with these good qualities they are like other uncivilized nations, extremely revengeful. They are said to live without any regular laws, and to eat only fish and the flesh of beasts, without shewing any signs of worship or religion.

The Chinese knowing there were gold mines in the island before they conquered it, and being unable to find any in that part under their subjection, would not venture to cross the mountains; but sent a small ship to the eastern parts, where they made no doubt they should find them. They met with an hospitable reception from the inhabitants, who generously offered them lodgings, provisions, and assistance; but gave them no information concerning the

the mines, possibly through jealousy of their power. After eight days search, they discovered only some ingots in the cottages, on which these innocent people seemed to set but little value.

The friendly natives having assisted them to equip their vessel in order for their return, the Chinese, whose avarice was inflamed at the sight of these ingots, invited their benefactors to a great entertainment, and having made them all drunk, cut their throats, and sailed away with the ingots. The news of this cruel act of more than savage ingratitude, was no sooner spread through the eastern part of the island, than the inhabitants took up arms, and made an irruption into the western part, where, without mercy, they put man, woman, and child to the sword, and set fire to their dwellings. Since that time the two parts of the island have been almost continually at war.

The lands possessed by the Chinese in the isle of Formosa, are divided into three subordinate governments that depend upon the capital of the island, and each of these governments has its particular magistrates, subject to the governor of the capital: and the governor himself is subject to the viceroy of the province of Fo-kien.

The capital, which is called Tai-ouan-fou, is very populous, and equal to most of the great cities of China. Every thing that can be desired may there be had in great plenty, not only what the island itself furnishes, but China and India cloths, varnish, China-ware, silk, and the several manufactures of Europe: there are but few mulberry-trees in the island, and consequently but little silk is made in the country. The emperor keeps there a garrison, consisting of a thousand men for the security of the settlement, and no Chinese can remove thither with his family without a passport.

Almost all the streets of the capital are drawn in a line, and covered seven or eight months in the year to defend the people from the heat of the sun. They are from thirty to forty feet in breadth, and some of them are near three miles long. Almost all of them are lined with shops of China-ware, silk, and other commodities in admirable order, in which the Chinese excel; and it would be exceeding pleasant to walk in them, were they better paved, and less crowded by passengers.

The houses are all thatched, and generally built of clay and bamboo; however, the disagreeable meanness of these buildings is concealed by the tents that cover the streets, so that nothing is to be seen but the shops.

This city has neither walls, or any other kind of fortifications, for the Tartars do not love to confine their courage within a rampart, but chuse to fight on horseback in the open field.

The harbour is sheltered from every wind; but the entrance into it becomes every day more difficult. There were formerly two entrances into it, but one of them is choaked up with sand, and the other, which has a rocky bottom, is not above nine or ten feet deep at high water.

The Chinese have three cities and many villages under their subjection; but their government and manners being the same as in China, we shall not tire the reader with a repetition of them. Those of the natives who are subject to the Chinese, are divided into forty-five towns, or plantations, thirty-six in the north, and nine in the southern part. The towns of the north are very populous, and the houses but little different from those of China; but those in the south are only a heap of round cottages made of clay and bamboo, in the form of a funnel inverted, and thatched at the top. They are from fifteen to forty feet in diameter, and some of them are separated by partitions; but in these huts are neither tables, chairs, benches, beds, nor any other furniture. Their beds are the fresh leaves of a particular tree, very common in the country, which they gather, and spread upon the ground, or on a board in their cottages, and there lie down to sleep. In the middle of the house is a kind of stove raised two or three feet from the ground where they dress their vicinals.

They are very slovenly at their meals, using neither dishes, plates, spoons, knives nor forks, but place what is provided upon a piece of board or mat, and use their fingers to eat with. They eat flesh half raw, and the less it is roasted the better they like it.

Their common food is rice, millet, and any game

they can take, which they either do, by killing them with their arrows, darts, and javelins, or overtake them by running, for they are so swift as to outstrip horses in their full speed, which the Chinese attribute to the custom of binding their loins and knees exceeding tight, till they are fourteen or fifteen years of age. They hurl their javelins seventy or eighty paces with the utmost exactness; and, though their bows and arrows are very ordinary ones, they kill pheasants flying.

The persons of the original inhabitants are not at all like their neighbours the Chinese. They are of a low stature, and have a large head, and high forehead, a wide mouth, high cheek bones, and a short flat chin, with very little beard. Their neck is small and long, their body short and square, and their arms and legs long, small, and ill-shaped.

Their whole apparel is a single piece of cloth two or three feet long, tied round the waste, and reaching down to the knees. Yet pride, which takes deep root in the human heart, is here indulged even in nakedness, and gives these people more pain and trouble than those who are more civilized feel, to procure the richest habits; for some of them imprint grotesque figures of trees, animals, flowers, &c. on their skin. But this privilege, which is allowed only to such as excel in running and hunting, costs them dear, and puts them to such violent pain, that the operation might endanger their lives was the whole to be performed at once; they therefore employ several months, and sometimes a whole year about it. However, all persons are at liberty to wear in their ears rings, and on their heads and necks coronets, and necklaces, consisting of several rows of small grains of different colours. These coronets are terminated with a plume of cocks or pheasants feathers; they also blacken their teeth, and wear bracelets above their elbows, and on their wrists. If we imagine a man with an olive complexion, a fine slender shape, with his hair hanging negligently on his shoulders, and adorned with those fantastical ornaments, with no other garments but a piece of cloth round his waste, and at the same time armed with a bow and arrows, we shall have a just idea of a beau of the south part of the isle of Formosa.

In the north part of the island, where the climate is cooler, they cover themselves with the skins of the deer they kill in hunting, and make them into a sort of coats without sleeves. They wear a bonnet in the form of a cylinder, made of the stalks of Banana leaves, which they adorn with coronets placed one above another, and tied with fillets and bands of different colours, having on the top a plume like those before mentioned.

When a man is desirous of marrying, he goes several days successively with music to the door of the house where the object of his affections resides, and if he be agreeable to her she goes out to meet him, and then they settle the terms between themselves; after which they speak to their parents, and desire them to prepare the wedding feast. This is made at the house of the bride's father, and there the bridegroom continues. Hence they place their good fortune, not in having boys, but girls, who procure them sons-in-law to be the props of their old age.

Though the islanders in this division are entirely subject to the Chinese, they still preserve some remains of their ancient government. Every town makes choice of three or four old men, most distinguished for their probity, to be their judges; these determine all differences, and if any one refuses to submit to their decision, he is instantly driven out of the town, without the least hope of ever returning, and no other town will receive him.

To regulate the tribute which they pay in grain, deer, skins, and other things easily procured in the island, there is in every town a Chinese who understands the language; and is interpreter to the mandarines; but instead of preventing these poor people from being oppressed, they behave like petty tyrants, and exercise the patience, not only of them, but of the mandarines themselves, who are forced to continue them in their employments to avoid greater inconveniences. There were formerly twelve towns in the south under subjection to the Chinese; but three of them revolted, drove out the interpreter, and united themselves to those of the eastern part of the island.

The

The Chinese themselves acknowledge, that amongst these people there is no cheating, robbing, or quarrelling, except with their interpreters, and that they practice all the duties of equity and benevolence. Whatever is given to any of them, they will not receive till those who shared the labour, partake of the wages.

In the year 1620, a Japanese squadron coming near Formosa, the commander was so pleased with the view of the country, that he resolved to settle a colony in the island, and therefore left some of his men on shore with orders to get information of every thing necessary to the execution of his design. Soon after a Dutch vessel was forced by a storm into the same harbour, and found the Japanese in no condition to oppose them. They thought the country extremely beautiful, and well situated for commerce, and therefore pretending to want refreshments, and to be under a necessity of refitting their vessel, which was damaged by the storm, they stayed on shore; and some of them made an excursion into the country, in order to view it more narrowly, which having done, they returned on board, and began to refit the vessel. They now desired the Japanese, whom they were unwilling to offend, for fear of injuring their trade to Japan, to allow them to build a house on the brink of the island at one of the entrances into the harbour, which they alledged would be of use to them in going and coming to Japan. The Japanese at first denied their request; but the Dutch pressing them to give their consent, and assuring them they desired no more ground than what could be encompassed with an ox's hide, the Japanese at last agreed to their request.

The Dutch then taking a large hide, cut it into small thongs, and tying them together, encompassed a spacious piece of land. The Japanese were at first a little vexed at this artifice; but were soon pacified, and laughing at the stratagem, suffered the Dutch to build a fort, to which they gave the name of the castle of Zealand. This fort gave the Dutch the command of the harbour, and made them masters of the only passage by which large vessels could enter it. The Japanese, either disgusted at the new fort, or not finding their account in staying in the island, soon after quitted it, and returned home. The Dutch, by this means, became sole masters of Formosa; for the inhabitants were unable to oppose them. They therefore strengthened themselves by building a fortification, consisting of four half bastions on the other side of the harbour, opposite to the fort of Zealand.

China was at this time all in a flame; the king of the Tartars was seated on the throne, and several of the provinces opposed him by a vigorous war, which was carried on with various success, till at length one of the Chinese generals being defeated, and driven out of China, he turned his views towards Formosa, resolving to drive the Dutch from thence, and erect a new kingdom there. The Dutch who apprehended no danger, had neglected to strengthen themselves with supplies of men from their other settlements, and there were only eleven of them to defend the fort and harbour of Formosa, the rest of the garrison being composed of Indians, and of the inhabitants of the country. Notwithstanding the great inequality of forces, the Dutch resolved to defend themselves, which they did with the utmost bravery. The Chinese general entered the harbour with a fleet composed of nine hundred sail, and landed part of his men, in order to attack the fort of Zealand both by sea and land. The siege lasted four months, in which the Dutch defended themselves with their great guns with more success than they themselves had expected. The Chinese general was enraged at meeting such opposition from a handful of Europeans against a numerous army: and as the Chinese had not the use of cannon, he had no hopes of reducing them, but by famine, which would require a long time, and in the mean while they might be relieved by ships from Batavia, or by those that trade to Japan. He therefore resolved to make use of his utmost efforts against the Dutch, who had four ships in the harbour, and had put on board each of them one of their own men, with some Indians, to guard it, the other seven Dutchmen remaining in the fort of Zealand.

The Chinese general finding no other method of injuring the Dutch, turned a few of his vessels into fire-ships,

and having the advantage of a high wind drove them upon the Dutch ships, and burnt three of them. Having thus succeeded in this attempt, he summoned the Dutch to surrender, offering them leave to depart with all their effects, and threatening if they refused to allow them no quarter. The Dutch, having now only one ship left, gladly accepted the offer, and having put on board all their effects, delivered the place into the hands of the Chinese, and departed. Some years after the Chinese in Formosa, taking advantage of a general amnesty, submitted to the emperor; this happened in the year 1683, and this island has ever since been subject to the Tartarian princes seated on the throne of China.

S E C T. XVI.

Of the Island of HAINAN.

Its Situation, Extent, and Climate. Its Soil, Minerals, Vegetables, and Animals. Of the Persons, Dress, Manners, and Customs of those of the Natives who have preserved their Freedom; and of the Government of that Part of the Island, which is subject to the Chinese.

HAINAN, which signifies South of the sea, is a large island, bounded on the north by the province of Quang-si, which, in clear weather, may be seen from the coast; on the east, by the Chinese sea; on the south by the coast of Cochinchina, and on the west by part of that kingdom, and part of the province of Quang-tong.

Its greatest length, from east to west, is between sixty and seventy leagues, and its breadth from north to south between forty and fifty, containing near one hundred and sixty leagues in circuit. The climate on the northern part is very unhealthy, chiefly on account of the water, for the inhabitants are obliged to boil in the morning all they propose to drink in the day.

The soil of that part of the island is a plain that reaches from the sea-side about fifteen leagues into the country; but the southern and eastern parts are very mountainous: yet there are some vallies in the center of the island, which are well cultivated, and produce two crops of rice every year; but the mountains for the greatest part are barren. In the midst of the island are gold mines, and in the northern part mines of lapis-lazuli.

Among the trees of the island are those which yield dragon's blood, and many others of different sorts, which, on an incision made in the bark, yield a white juice, which, as it hardens, turns red, but has not the consistence of gum: this matter being thrown into the fire burns slowly, and diffuses a smell weaker, but more agreeable than incense. Among the other trees are those called by the Europeans eagle-wood, and rose, or violet-wood, which is thus named, on account of its scent. There is also a yellow wood that is very fine, and in a manner incorruptible. Columns made of it are sold at a high price, and are kept for the sole use of the emperor.

The island not only produces the various fruits that grow in China, but sugar, tobacco, cotton, and indigo; they have also arca nuts and rattan canes.

Among the animals is a remarkable kind of large black apes, that very much resemble the human species, and have features well made; but these are very scarce. There are others that are grey and very ugly. All sorts of game are very plentiful, particularly deer, hares, and a kind of wild boars.

The partridges and quails are inferior to those of Europe; but snipes, teal, and all sorts of water fowl, are very good. The woodcocks here are excellent, and turtle-doves, and wood-pigeons, are in great plenty.

There are likewise several sorts of curious birds, some of which are of the size of a linnet, with feathers of a beautiful red, and others of a bright gold colour: these two sorts of birds are always together. There are ravens with white rings about the neck, starlings, with a little moon on their bills, and a bird of the shape and size of a black-bird, but is of a deep blue, with yellow ears about half an inch long. These birds talk and whistle to perfection.

In the island are also found snakes of a monstrous size, but so timorous, that they are frightened at the least noise, and

and are far from being dangerous, as the natives travel barefoot both by day and night through the plains and thick woods without being hurt.

This island is subject to China, except the middle part, where the natives have retired to the mountains, and live independent of the mandarines. They formerly traded with the Chinese, with whom they exchanged gold, which they dig out of their mines, China-wood, and Calamba-wood, for other commodities, which brought immense profits to the mandarines: but these islanders scarce ever appear unless it be to surprize some of the neighbouring villages; yet they are such cowards, and so ill disciplined, that it is said fifty Chinese would defeat some hundreds of them. However, a part of them pay tribute to the emperor, and are suffered to possess villages on the plain. Many others, particularly in the east and southern parts of the island, are in the service of the Chinese; these keep their sheep and till their lands, but they are generally deformed, very short and of a redish complexion.

Both the men and women wear their hair in a ring on the forehead, and on their heads a hat made of straw or rattan, and tied under their chin. The men wear only a piece of calicoe, which is either black or of a deep blue, and covers them from the waist to the knees. The women wear a kind of waistcoat of the same stuff, and also paint their faces from their eyes downwards with blue streaks made of Indigo. Both sexes wear gold and silver

ear-rings, with pendants made in the form of a pear and well wrought.

Their arms are bows and arrows, in the use of which they are not very skilful. They have also a kind of hanger, which they carry in a little basket fastened to their girdle behind. This is the only instrument they use for doing their carpenters work and clearing their way through the forests.

This island is in the district of the province of Quang-tong. Its capital, which is named Kiun-tcheou, is built on a promontory, and ships lie at anchor under its walls. 'Tis governed by two sorts of mandarines: those of the mandarines of learning, and those of arms. There are three cities of the second order, and ten of the third; all of them near the sea-side, and under the jurisdiction of the capital.

In the north of the island is the port to which the barks of Canton resort. It is formed by a wide river, the entrance of which is defended by two small forts; though it has but ten or twelve feet water. The capital is situated within two leagues of this port, and between them is a large plain, in which are many Chinese sepulchres. In the south part of the island is a fine port at the bottom of a great bay, where there is near twenty feet water: by the shore of this port are abundance of maritime plants and madrepores of all kinds.

C H A P. III.

Of K O R E A.

S E C T. I.

Of the Situation, Extent, Climate, and Soil of Korea. Its Vegetables and Animals. The Dress, Manners, and Customs of the Koreans. Their Houses described, and their Hospitality to Travellers.

THOUGH the kingdom of Korea, or Corea, be only tributary to China, yet as it is situated on the eastern extremity of Asia, we shall give a description of it before we treat of that part of Tartary that is immediately subject to the emperor.

Korea is called both by the Chinese and the natives Kaoli; and is a peninsula of Asia, that extends from about the thirty-fourth to the forty-third degree of north latitude, it being about four hundred and fifty miles in length from north to south, and two hundred and twenty-five in breadth from east to west. It is bounded on the north by the country of the Manchew Tartars: on the west by the province of Leao-tong and the Yellow sea; on the east it is bounded by the sea of Corea, which separates it from Japan; and on the south by the ocean. The coasts being inclosed with rocks and sands, strangers cannot approach them without danger.

On the north are long and high mountains, where the cold is so intense, that the rice and the cotton-plant will not grow. The poor people there feed on barley, while the rich have meal brought from the south. The mountains are, during the winter, covered with deep snow, and the people in order to walk upon it, wear pieces of boards under their feet, to prevent their sinking.

The most considerable rivers of Korea are the Yalou and the Towmen, both of which rise in the same mountain, which is one of the highest in the world. One of them flows to the east, and the other towards the west. They are both pretty deep, and moderately rapid; and the water is very good.

All the southern part of the country is extremely fertile, and produces all the necessaries of life, especially rice, wheat, millet and other sorts of grain. The ginseng, a root so highly esteemed by the Chinese for its medicinal virtues, is also found here, though not in such quantities as in the country of the Manchews. They have also

tobacco, hemp, and cotton; and most of the trees found in the northern parts of China.

They have plenty of horned cattle, which they use in tilling the land. They have also swine, dogs, and cats; of the wild kind, there are tygers, bears, wolves and fables, deer, foxes, and many others. The rivers are often pestered with alligators or crocodiles, and the land with abundance of snakes and other venomous creatures.

The country abounds with fowl, and there are plenty of herons, woodcocks, pheasants, pigeons, swans, geese, ducks, and all sorts of poultry; with eagles, storks, kites, magpies, daws, and lapwings; besides some sorts unknown in Europe.

Korea is divided into eight provinces, containing three hundred and sixty cities and towns, with many forts and castles on the mountains.

The Koreans are generally well shaped, and of a mild and tractable disposition; they are lovers of learning, and fond of music and dancing. The northern provinces produce the stoutest men and the best soldiers, but they are said to be in general very effeminate, and possessed of little courage: they are even not ashamed of cowardice, and lament the misfortune of those who are obliged to fight. They are terrified at the sight of blood, and fly whenever they meet with it. They are also much afraid of the sick, particularly of those who have contagious diseases, whom they remove into little straw hovels in the midst of the fields, where their friends look after them, and give notice to passengers to keep at a distance; but when the sick have the misfortune to have no friends, others will rather suffer them to die for want of attendance than come near them. When a town or village is infected with the plague, the avenues to it are shut up with hedges of briars, and some are placed on the tops of the infected houses, that people may know them. Though many medicinal plants grow in the country, the people are unacquainted with them, and most of the physicians are employed by the grandes; so that the poor, who are unable to be at the expence of having recourse to them, apply to a set of people whom they esteem conjurors.

Adultery and theft are but little known amongst them, and they have such little reason to be suspicious, that it is not usual for them to shut their doors at night. Indeed

the revolutions of government have made them deviate a little from their primitive innocence, yet they may still be considered as a pattern to other nations.

Their dress is a gown with long and wide sleeves, a high square fur cap, with a girdle about their loins, and boots of leather, linen, or fatten. The quality usually dress in purple-coloured silk, and the literati are distinguished by wearing two feathers in their caps. The cloth worn by persons of distinction on public occasions, is made of gold and silver brocade; however, the poor wear only skins and cloth made of cotton or hemp. Their arms are cross-bows and long sabres.

The houses of the Koreans of quality make a stately appearance, but those of the common sort are mean, nor are they allowed to build as they please, for no man must cover his house with tiles without leave; on which account they are generally thatched with straw or reeds. These houses are small, consisting of one story and a garret over it, in which they lay up their provisions; but they have seldom more furniture than is absolutely necessary. They are built with wooden posts fixed in the ground, and the spaces between filled up with stone to the first story. The rest of the structure is of wood, plattered without, and covered on the inside with white paper; the floors are vaulted, and in winter they make a fire underneath, so that they are always as warm as if in a stove.

The nobility have always an apartment in the front of the house in which they receive their friends and divert themselves; and there is generally before their houses a large square with a fountain, or a fish-pond, and a garden with covered walks. Tradesmen and the chief citizens have generally a ware-house adjoining to the building in which they dwell; and there they treat their friends with arrack and tobacco, for there are few of either sex but what smoke. The children of four or five years of age are also fond of smoking. The women's apartment is in the most retired part of the house, where none must approach them. Some wives, however, are allowed the liberty of seeing people and going to feasts, but they sit by themselves facing their husbands.

In the country are abundance of houses for pleasure, to which the Koreans resort to see women dance, sing, and play upon musical instruments. In summer they enjoy this recreation under the cool shade of a pleasant grove. They have no inns for the entertainment of passengers, but he who travels sits down at night near the pales of the first house to which he comes. Those within soon bring him boiled rice, and dress meat for his supper. He may stop at as many houses as he pleases; but in the great road to Sior there are houses where those who travel on public affairs have lodging and diet, at the expence of the public.

SECT. II.

Of their Marriages, the Education of their Children, and their Mourning at the death of a Parent. Of their Language, and different Manners of Writing.

KINDRED are not permitted to marry within the fourth degree. As the girls are married at eight or ten years of age, they are never courted by their future husbands. They no sooner change their state, than they remove to their father-in-law's house, where they reside till they have learned to get their living, or to govern their family. The marriage-ceremony is very simple: the man only mounts his horse, and riding about the town, attended by his friends, at last stops at the bride's door, where he is received by her relations, who soon after conduct her to his house, where the marriage is consummated without any other ceremony.

A man has the liberty of keeping as many women abroad as he can maintain, and may at any time repair to them without scandal; yet none lives with him but his wife. Noblemen indeed have two or three women besides in the house, but they have nothing to do with the management of the family. The Koreans use their wives little better than slaves; and though a woman has borne her husband many children, he may put her away on the slightest pretence whenever he pleases and take another: but what is

still more unjust, he can compel her to take and maintain the children.

Parents are indeed very indulgent to their offspring, and in return are much respected by them; but the case is very different with the slaves, who shew but little regard for their children, because they know they will be taken from them as soon as they are able to work. If a freeman lies with a female slave their children are slaves, and those whose father and mother are both slaves are the property of the mother's master.

The nobility and freemen in general are very careful of the education of their children, and put them while young to learn to read and write. The masters use no rigour in their manner of teaching, but manage all by fair means. They inspire their scholars with emulation by giving them an high idea of learning, and mentioning the worth of those of their ancestors, who by study have acquired great wealth. By such exhortations they make them improve in expounding the writings they give them to read, in which all their learning consists. There are besides in every town a house where the nobility, according to ancient custom, assemble the youth to make them read the history of their country and the trials of those who have suffered death for their crimes.

Assemblies are also annually held in two or three towns of each province, to which the youth assemble to get employments either by the pen or sword.

The governors of towns send thither able deputies to examine them, and choose the best qualified; and, according to the report made to them, write to the king, who bestows employments on those who are esteemed worthy of them. The old officers, who have had only civil or military commissions, at this time endeavour to increase their revenue by obtaining both; but their aspiring to these honours is often attended with ruin from the presents they make, and the treats they give to obtain votes.

When a freeman dies his children mourn three years, during which time they are incapable of any employment; and those who enjoy any posts are obliged to quit them: it is not even lawful for them to lie with their wives; and should they have any children born during the mourning they would be accounted illegitimate. The mourning-robe is a long hempen cloak, without any thing under it but what is made of sackcloth. On their caps, which are of green reeds interwoven, they wear a hempen cord instead of a hatband. They never go without a great cane or stick in their hand, which serves to distinguish who they are in mourning for; the cane denoting the father, and the stick the mother. During the whole time of mourning they never wash, and consequently appear extremely nasty. As soon as any one dies his kindred run about the streets shrieking and tearing their hair. They take particular care to bury him honourably in some part of a mountain chosen by a fortune-teller. Every corpse is inclosed in two coffins, each of which is two or three fingers thick; these are put one within the other, and painted and adorned according to the ability of the person who purchases them. They generally bury their dead in spring and autumn. Such as die in summer are placed in a thatched hut raised on four stakes, till the rice harvest is over. When they intend to bury them they bring them back to the house, and set out at break of day with the body, the bearers singing and keeping time as they go, while the relations and friends of the deceased make the air resound with their cries. Three days after the latter return to the grave, where they make some offerings, and eating all together are very merry. The great men have sepulchres of stone, on which are cut their names, qualifications, and employments; but the common people have only graves five or six feet deep. Every full moon they cut down the grass that grows on the grave, and offer new rice upon it, that being their greatest festival next to the beginning of the new year.

The children having performed this duty to their parents, the eldest sons take possession of the house, with all the lands belonging to it; and the rest is divided among the sons, the daughters being said to have no share on account of their having no fortunes to give their husbands, except their cloaths. When a father is fourscore years of age he declares himself incapable of managing his estate, and resigns it up to his children; upon which the eldest taking

taking possession, builds a house at the common expence for his father and mother, where he lodges with them, and supports them, treating them with the greatest respect.

Their language is very copious, and their way of writing and arithmetic are very hard to learn. They have three sorts of writing. The first consists of large broad strokes, like that of China, and is used in printing: The second is a kind of running hand used by the great men and governors, in answering petitions. The third, which is a ruder scrawl, is used by women, and the common people; it being easier to write in this character than in the other two, names and things never before heard of.

All these kinds of writings are performed with a hair pencil. They have abundance of old books, both printed and manuscript, which are preserved with the utmost care. Copies of them are deposited in several towns, that in case of fire they may not all be destroyed. They print from blocks of wood, like the Chinese; and keep their account of time by moons.

S E C T. III.

The Respect paid to the Chinese Ambassadors, who come to receive the Tribute. The Power of the King, and the Form of the Government. His Revenue, Military Officers and Soldiers, with the Punishments inflicted on Criminals.

AS Korea is tributary to the eastern Tartars, who conquered it before they subdued China, an ambassador comes three times a year to receive the tribute which the people pay in ginseng. The king, with his whole court, goes out to meet him, and waits upon him to his lodging. This ambassador is treated with such extraordinary respect that he seems to be more honoured than the king himself. He is preceded by musicians, dancers, and vaulters, who endeavour to divert him, and during the whole time he remains at court, all the streets from his lodging to the palace, are lined with soldiers, standing within ten or twelve feet of each other. Two or three men have no other employment than to pick up notes thrown out of the ambassador's window, in order to be carried to the king, who is solicitous to know whatever he is doing, and studies every possible method of pleasing this officer, that he may make a favourable report of him to the emperor of China.

The king of Corea has however an absolute authority over his own subjects. None of them have any property in the lands, and the revenues of the nobles arise out of those estates they hold of his majesty during pleasure, and from the number of their slaves. The chief officers by sea and land compose the king's council, and meet every day at court, but they must wait till their advice is asked before they give it, and till they are appointed to manage any business, must not interfere in it. These have the first places about the king, which they enjoy till fourscore years of age, provided their behaviour is unexceptionable. The same is practised in the inferior employments at court, which no man quits unless it be to rise. The governors of places, and subaltern officers, are removed every three years, but seldom serve out their time; they being frequently cashiered for misdemeanors on the accusation of the spies kept by the king in all parts of his dominions.

When his majesty goes abroad he is attended by all the nobles of his court, who wear their respective badges, consisting of a piece of embroidery before and behind, on a garment of black silk with a very broad scarf; a great body of soldiers following. He is preceded by a body of foot and horse, some carrying colours and banners, others playing on warlike instruments: They are followed by the life-guards, composed of the principal citizens. The king is in the middle, carried under a rich gold canopy. When he passes by the great men, or soldiers, they must turn their backs to him without offering to look; or so much as cough. Just before him goes a secretary of state, or some great officer, with a little box: into this he puts all the petitions and memorials, which private persons either present on the end of a cane, or hang along the walls, or pales; so that they cannot see who

prefers them. These, which are brought him by men appointed to gather them, are laid before the king, on his return to the palace; and whatever he orders relating thereto, is immediately put in execution. All the windows and doors of the houses in the streets, through which his majesty passes, are shut, and no person whatever dares presume to open them.

The king keeps a large number of soldiers, whose chief business is to guard his person when he goes abroad. The provinces are likewise obliged to send all their freemen, once in seven years by turns, to guard him for two months.

Every province has a general, with four or five officers under him; every one of whom is governor of some town or strong hold; insomuch that there is not a village, where a corporal commands, but has under him tithing men, or officers over ten men. These corporals are obliged once a year to deliver to their captains a list of what people are under their jurisdiction.

Their cavalry wear cuirasses, head-pieces, bows and arrows, swords, and whips, with small iron points. The foot likewise wear a corselet, a head-piece, a sword, and half pike. The officers carry nothing but bows and arrows. Every town, in its turn, is obliged to furnish a number of religious men, to guard and maintain, at their own expence, the forts and castles which are situate in narrow passes, or on the sides of the mountains. These are esteemed the best soldiers; they obey officers chosen out of their own body, and observe the same discipline as the other troops. Those turned of sixty are rendered incapable of duty, and their children supply their places.

The far greatest part of Korea being encompassed by the sea, every town is obliged to fit out and maintain a ship. These have generally two masts, and about thirty oars, to each of which there are five or six men. They carry some small pieces of cannon, and also artificial fireworks. Every province has its admiral, who once a year takes a view of these vessels, and gives an account of what he observes to the high admiral, who is sometimes present at these reviews. If, when he is present, any of the admirals, or officers under them, commits a fault he is punished with banishment or death.

The revenue for the support of the king's household and his forces arises out of the duties paid for every thing produced in the country, or brought by sea. In all towns and villages there are store-houses for the fruits of the earth, which the farmers of the revenues take upon the spot in harvest time. Those who have employments under the government receive their salaries out of the revenues of the place where they reside, and what is raised in the other parts of the country is assigned for the payment of the sea and land forces.

Justice is severely administered among the Koreans; whoever rebels against the king is destroyed with all his race; a proceeding equally contrary to justice, and shocking to humanity: his houses are thrown down, and no man dares ever rebuild them: all his goods are forfeited, and sometimes given to private persons. Nothing can save the man from punishment, who endeavours to intercede for the guilty, or to expostulate on the cruelty of this sentence.

If a woman murders her husband she is buried alive up to the shoulders in a high way, and an ax being laid by her side, all passengers, who are not noblemen, are obliged to give her a stroke upon the head till she expires. The judges of the town, where this crime is committed, are suspended from the execution of their office, and the place being deprived of a governor is made subordinate to another town, or at best only a private gentleman is left to command in it. The same penalty is inflicted on such towns as mutiny against their governor, or send false complaints against him to court.

It is lawful for a man to kill his wife for adultery, or any other heinous crime, on proving the fact. But if the woman thus killed was the slave of another person, he must give three times her value to her owner. Slaves who murder their masters are cruelly tormented, till they expire; but they think it no crime for a master to kill his own slave upon a slight provocation.

Murderers

Murderers are punished in the following manner. After they have long trampled upon the criminal, they pour vinegar, in which they have washed the putrified carcase of the person murdered, through a funnel down his throat, and when he is full, beat him on the belly with cudgels till he bursts.

Robbers are trampled to death.

If a single man be found in bed with a married woman he is stripped till he has nothing upon him but a pair of drawers, then daubing his face with lime, they run an arrow through each ear, and fasten a little drum on his back, which is beat through the streets, in order to expose the offender, whose punishment ends with his receiving forty or fifty strokes with a cudgel on his bare posteriors; but the woman receives them with drawers on. The men are so jealous that they seldom allow their best friends to see their wives.

If a married man be caught lying with another man's wife, he is to suffer death. This chiefly happens among people of rank. The criminal's father, if living, or else his nearest relation, is obliged to be the executioner; but the offender is to chuse his death. The man generally desires to be run through the back, and the woman to have her throat cut.

Those who, at an appointed time, do not pay their debts are beaten twice or thrice a month on the shin-bones, which is continued till they find means to discharge them; but if they die before they satisfy the creditor, their nearest relations must pay it for them, or suffer the same punishment.

The slightest punishment in this country is being bastinadoed on the buttocks, or calves of the legs, which they consider as no disgrace, it being so very common, that they are often liable to it for speaking a word amiss.

When a person is bastinadoed on the shin-bones, they tie the criminal's feet together on a small bench four fingers broad, and laying another under his hamis, which are bound to it, they strike on the shins with a sort of lath of oak, or alder, two inches broad, about the thickness of a crown-piece, and as long as a man's arm. They are not to give above thirty strokes at one time, and two or three hours after they repeat them, till the whole number be complete according to the sentence.

When they are to be beaten on the calves of the legs, it is done with wands as thick as a man's thumb. This punishment is inflicted upon women and servants, and while it lasts the criminals make such lamentations as are very painful to the spectators.

When an offender is to be bastinadoed on the soles of the feet he is seated on the ground, and his feet being bound together by the great toes, are placed on a piece of wood, and beat with a cudgel, as big as a man's arm, and three or four feet long.

The bastinado on the posteriors is thus performed: the men being stripped are laid with their faces to the ground, the women have a pair of wet drawers left on, and in this posture they beat them with a larger and longer lath than that beforementioned. An hundred strokes are equivalent to death, and many die before they receive fifty.

SECT. IV.

Of the Religion of the Koreans, and of their Priests, Monastics, and Nuns.

THE Koreans appear to have very little religion. The people at their festivals repair to the temple, where every one lights a piece of sweet wood, and putting it into a vessel, place it before the idol, and making a low bow, depart. This appears to be all the religious worship they pay to their gods. They are of opinion that the virtuous shall be rewarded, and the wicked punished, but as they have no religious mysteries, nor preaching, they are free from all disputes about matters of faith; and ignorance and uniformity of sentiment is preserved throughout the kingdom.

The priests offer perfumes before the idols twice a day; and on festivals, they all make a noise with their kettles, basons, and drums.

The temples and monasteries erected by the contributions of the people, are very numerous, and are generally

built on mountains. Some of these houses of retirement contain five or six hundred religious, and within the liberties of some towns there are at least four thousand of them. They are divided into companies of ten, twenty, and sometimes thirty. The eldest governs, and if any one neglects his duty, he has the power of ordering the others to punish him with twenty or thirty strokes on the posteriors; but if he is guilty of any heinous offence, they deliver him up to the governor of the town to which they belong. As every man is at liberty to embrace a religious life, Korea swarms with those of this profession, which they are the more ready to embrace, as they may quit it whenever they please. However, these monastics are generally held in as little esteem as the slaves, on account of the taxes they are obliged to pay, and the work they are forced to perform.

Their superiors are highly esteemed, especially when they are men of some learning; for they are considered as grandes, and being called the king's religious men, wear the badge of their order over their cloaths. They pay their visits on horseback, shave both their heads and beards, are forbid to converse with women, and to eat any thing that had life. The breach of these rules is punished with seventy or eighty strokes on the buttocks, and with being banished the monastery. When they are first shaved they impress a mark on their arm, which never wears off. The inferior priests work for their living, or follow some trade, but some of them spend their time in begging, yet all of them have a small allowance from the governor. They educate children in their houses, teaching them to read and write, and if any of the boys consent to be shaved, they retain them in their service, and receive what they earn, but when their master dies they become free, and heir to all his goods, and therefore they are obliged to mourn for him as if he had been a father.

There is another sort of religious men, who, like the former, abstain from flesh, but are not shaven, and are allowed to marry.

'Tis remarkable, that they have a tradition that mankind had originally only one language; and that the design of building a tower to ascend up into the heavens, caused the confusion of tongues.

The nobles frequent the monasteries to divert themselves, either with the common women they find there, or with others they take with them, for they are delightfully situated: they all afford the finest prospects, and have very beautiful gardens, so that they seem rather to be pleasure-houses than buildings formed for the service of the temples.

In the city of Sior are two convents of religious women, one of maids of quality, and the other of those of the inferior sort. These religious women are all shaven, and observe the same rules as the men. They are maintained by the king and the nobles; and are not confined for life, but have leave to marry.

SECT. V.

Of the Trade of the Koreans.

THE Koreans have scarce any trade but with the Japanese, and the people of the island of Ceuxima, who have a storehouse in the south part of the town of Poufang. They supply Korea with pepper, fragrant wood, allum, buffaloes horns, goats, and buck-skins, and, in exchange, take the produce and manufactures of the country. The Koreans also carry on some trade with the northern ports of China in linnen and cotton cloth; but it is attended with great expence from their being obliged to travel many leagues on horseback. None but the rich merchants of Sior trade to Pekin, and they are always three months at least on the road.

There is only one sort of weight and measure used throughout the kingdom, but it is very much abused by the traders, notwithstanding all the precautions of the governors. They have no money, but pieces called casies, which only pass on the frontiers of China. They pass silver by weight, in small ingots, like those brought from Japan.

They cast accounts with little sticks, as some other nations do with counters: but have very little knowledge in arithmetic.

C H A P. IV.

OF EASTERN TARTARY; or, the Country of the MANCHEWS,

S E C T. I.

Of Tartary in general, and particularly of Eastern Tartary. Its situation, Extent, and Climate. The Province of Mugden and its Capital described. The Road formed for the Emperor of China from Pekin to that City, and the Manner in which that Prince amuses himself with hunting in his journeys.

WE shall now proceed farther to the north, and view the desert regions of Tartary, a country of vast extent, which taken in its utmost limits, reaches from the Eastern Ocean to the Caspian Sea; and from Korea, China, and the two Bockarias, to Siberia and Russia; including all the middle part of Asia. This prodigious extent of country, inhabited by Tartars of different denominations, and different manners, is situated between the fifty-fifth and one hundred and forty-first degrees of longitude from London, and between the thirty-seventh and fifty-fifth degrees of latitude. Whence it is three thousand six hundred miles in length, and nine hundred and sixty in breadth; but in the narrowest part it is not above three hundred and thirty miles broad.

Above half of this extensive country either belongs to the emperor of China, or is tributary, or at least under the protection of that monarch; and a very considerable part of Western Tartary has been conquered by the Russians. We shall here only treat of the former; and in the descriptions of those desolate countries, which afford little entertainment to the reader, shall be as concise as possible.

The country of the Manchew Tartars is situated in the north of Laotong, the most eastern province of China, and from south to north extends from the forty-first to the fifty-third degree of north latitude; from west to east from about the one hundred and fourth degree of longitude from London to the Eastern Ocean: and is bounded on the north by the great river Saghalian-ula, on the south by the province of Laotong and Corea, on the east by the Eastern Ocean, and on the west by the territory of the Mongals.

Though the extent of this country is so very large it was always thinly peopled, especially since the emperors of China drew many of its inhabitants to Pekin. The air, notwithstanding its situation, is extremely cold, and the country mountainous and full of forests. The Tartars chiefly inhabit the banks of the rivers, where they build their huts, and divide their lives between hunting and fishing; for as they have plenty of game and fish the inhabitants of a great part of this country seek no other subsistence.

As this was the country from which the present emperors of China received their origin, it is intirely under the Chinese government, and is divided into three provinces, Mugden, Kirin-ula and Tsitsikar.

The province of Mugden is about two hundred and seventy miles long, and one hundred and twenty-five broad. It is inclosed by a wooden palisado seven or eight feet high, more fit to mark its bounds, and exclude petty robbers, than to prevent the entrance of an army. The gates are as weak as the rest of this trifling fortification, and are only defended by a few soldiers. The land is in general very good, and produces plenty of wheat, millet, roots, and cotton. The inhabitants feed numbers of oxen and sheep, which last are seldom seen in China. They have also plenty of apples, pears, nuts, filberts, and chestnuts, even in their forests.

The capital of the country is also named Mugden. The Manchews consider it as the metropolis of their particular nation; and therefore since their possession of China have not only adorned it with several public edifices, and stored it with magazines, but have settled here the same sovereign tribunals as those of Pekin, except the first and chief, which is called Ly-pou; these consist only of the

native, and all their public acts are written in the Manchew language, which is extremely copious.

This city is also the residence of a Tartarian general, who keeps there his lieutenant-generals, and a considerable body of soldiers. Near the gates of the city are two burying-places of the first princes of the reigning family: these are built according to the Chinese architecture, and several Manchew mandarines are appointed to take care of them; and, at particular times, to perform the same ceremonies there as if the princes were still living.

The city of Fong-whang-ching is the most populous, and has a very considerable trade from its being in a manner the key of the kingdom of Korea. This has drawn thither a great number of Chinese merchants, who have handsome houses in the suburbs. The principal merchandize is paper, made of cotton, which is very strong and durable, but neither very white nor transparent.

From Pekin to Mugden, which is by the Chinese called Shing-yang, a road has been made, near eleven hundred miles in length, for the emperor and his retinue, when he visits his Tartarian dominions. It is about ten feet broad, and as strait and even as possible. On the sides run a sort of little causeways, a foot high, exactly even, and parallel. This road, especially in fine weather, is as clean as a threshing floor, men being appointed for that purpose. Another road is made for the emperor at his return. In these roads they have endeavoured to level mountains; and have built bridges over torrents. When he approaches, these are lined on the sides with mats painted with animals, that have the same effect as the tapestry with which the streets are hung when processions are made.

But in these journeys the emperor and his nobles usually quit these roads, and as they pass along spend their time in hunting, which is thus performed: three thousand of the emperors guards, with their captains and the lords of the court, all armed with bows, arrows, and darts, disperse themselves on every side, and form a circle at least three miles in diameter: then approaching step by step, without breaking their order, they reduce this great circle to one of about three hundred paces in diameter; when all the beasts surrounded in the first are taken in the last; for the men draw up so close as to leave no room for them to escape, and keep up so brisk a chase, that the poor creatures, spent with running, are easily killed, or lie down at the hunter's feet. Verbiest, a missionary, who attended the emperor in one of these expeditions, saw two or three hundred wild horses thus taken in less than a day; besides a great number of wolves and foxes killed. Another time he saw above a thousand deer thus inclosed, and several bears, wild boars, and above sixty tygers slain.

S E C T. II.

Of the Province of Kirin-ula: its Extent and Climate. The Face of the Country. The Manner in which the Emperor's Soldiers search for the valuable Root Ginseng. Of the Yupi Tartars, their Dress, Manners, and Way of Life. Of the Kecheng Tartars.

THE second province, called Kirin-ula, is bounded on the west by the palisado of Laotong, on the east by the Eastern Ocean, on the south by the kingdom of Korea, and on the north by the great river Saghalian-ula; and is seven hundred and fifty miles long and six hundred broad; yet this extensive province is so thinly peopled that it has only three cities, which are very ill built, and inclosed with mud walls.

This country extends to the fifty-third degree north latitude, and is exceeding cold, and the winter begins much earlier than with us, the rivers being frequently frozen over in September. This is by some attributed to the extensive woods with which the land is covered. The

country

country to the north of Mugden rises in steep mountains, then sinks into deep vallies, and is sometimes spread out into desert plains, where the traveller for several days meets no human being, nor any friendly cottage. The hills, particularly towards the east, are covered with huge oaks, and forests uncut for ages past. Indeed the whole country appears like a wilderness, and nothing is seen all around but hills, vales, and the dens of bears, tygers, and other savage beasts; scarce a house is seen except some pitiful huts by the sides of the rivers and torrents: yet in the southern parts the eye of the traveller is sometimes delighted by his unexpectedly finding, amidst these desert tracts, a fine valley watered with rivulets, whose banks are enamelled with a variety of flowers, like those in the gardens of Europe, particularly roses and yellow lillies of the most lively colours.

The inhabitants raise oats, which, though scarce in China, are here so plentiful as to be given to the horses; but they have little wheat and rice. The plant most esteemed is the ginseng, or jingseng, called by the Manchews the queen of plants. It is highly prized for its virtues in curing several diseases, and particularly all decays of strength proceeding from excessive labour of body or mind. Hence it has ever been the principal riches of Eastern Tartary; and is so much valued, that at Pekin an ounce of it sells for seven times its weight in silver.

The Chinese use to go into this country among the crowds of mandarines and soldiers continually passing and repassing, and then getting the ginseng return with it to Pekin; but in 1709 the emperor, chusing that the Manchews should reap this advantage, ordered one thousand of his Tartarian soldiers, encamped without the great wall, to go and gather all the ginseng they could find, on condition that each should present him two ounces of the best, and take an equal weight of fine silver for the remainder; and thus the emperor that year procured twenty thousand pound weight of it for less than a fourth part of the price at which it is sold at Pekin.

The herbalists sent on this expedition undergo great hardships. On beginning their search they quit their horses, and carry neither tent nor bed with them, nor any other food but a bag of parched millet; and at night lodge upon the ground, either under a tree or in a slight hut formed with boughs. The officers who encamp at a distance, in places that afford pasture for their cattle, inform themselves of their diligence by persons they from time to time send to them with beef or the game they kill. Their chief danger is from wild beasts, especially tygers, against which they are obliged to be continually on their guard. If after the signal for the return of the troop any one be missing, they conclude that he is devoured; and, after having sought him a day or two, remove to another place, and continue their search with the same ardour as before. This fatigue and danger is in a manner inevitable, the plant only growing on the sides of mountains covered with woods, among the clefts of the rocks, or on the high banks of rivers.

The ginseng is easily distinguished from the other plants by which it is surrounded, frequently by a cluster of round fruit of a red colour, supported by stalks that shoot above the branches.

The root alone is used in medicine, and has this remarkable quality, that it shews the number of its years by the remains of the branches it has sent forth. Its age enhances its value, for the largest and firmest of these roots are the best.

The river Ufuri, which falls into the Saghalian, is the finest in the country, both for its clearness and the length of course. The Yupi Tartars live in villages on its banks, and its fish serve the inhabitants both for food and raiment. These Tartars are skilled in dressing skins, which they dye of three or four colours, and sew them so neatly that one would imagine they made use of silk, till on ripping a stitch or two is seen an exceeding fine thong, cut out of a very thin hide. They wear the same dress as the Manchews and Chinese; only the bottom of their long robes has commonly a red or green border, on a white or grey ground. The women also hang little bells or small pieces of brass coin at the bottom of their mantles, which, by their glingling, give notice of their approach. Their hair, which is parted into several tresses, falls upon their

shoulders, and is covered with rings, bits of looking-glasses, and other baubles, which they esteem as jewels.

Their manner of life is no less extraordinary. They spend all the summer in fishing, and lay up one part of what they catch to make oil for their lamps; another part serves for their daily food; and the rest, which they dry in the sun without salting, is laid up for their winter provisions, and of this both the men and beasts feed when the rivers are frozen. These people seem to have great strength and vigour, and yet the animals used for food are very scarce and extremely ill tasted. When the rivers are frozen they travel upon them in sledges drawn by dogs, which on that account are highly valued.

The missionaries, in passing through the province of Kirin-ula, met a lady of Ufuria coming from Pekin, where her husband, who had been general in chief of this nation, was lately dead; she told them, that she had an hundred dogs for her sledges, one used to the road went before, and was followed by those in harness to the end of the stage, where they were relieved by others from the spare pack. She assured them, that she had often run an hundred Chinese furlongs, or ten leagues, without resting. Instead of bringing the missionaries tea, which is customary among the Chinese and Tartars, her attendants served up small pieces of sturgeon upon a neat rattan salver.

This lady, who understood Chinese, had a very different air and manner from these Yupi Tartars, who are generally of a peaceable disposition, but heavy, unpolished, and without the least tincture of learning, or any public religious worship; the Chinese idols themselves not having as yet been introduced among them. This the Jesuits attribute to the poorness of the country; and the Bonzes not being willing to enter a place where the people sow neither wheat nor rice, but only a little tobacco near each village on the banks of the river. All the rest of their country is covered with a thick and almost impenetrable wood; whence they are annoyed with a cloud of musketoes, which they are obliged to drive away with smoke.

Almost all the kinds of fish taken in these rivers are to be found in Europe, but no European river can furnish such quantities of sturgeon. This is the principal fishery of the nation; they call the sturgeon the king of fishes, and eat certain parts of it raw, in order to partake of the virtues they attribute to it. Next to the sturgeon they highly prize a fish that is unknown to us, but is one of the most delicious that can be eaten: it is almost of the shape and size of a small tunny, but the flesh is intirely red: it is however very scarce, and the missionaries could never meet with it above once or twice. They have small boats formed of the bark of trees, so well sewed as to keep out the water. The natives commonly spear the large fish, and take those that are small in nets.

The language of the Upi Tartars seems to be a mixture of that of the Manchews, their neighbours on the south and west, and that of the Kecheng Tartars on the north and east. They have no king or sovereign, but every company chuses its own chief, whom they obey much like the Indians in America.

The same must be said of the country of the Kecheng Tartars, which extends one hundred and fifty leagues along the Saghalian-ula to the ocean: in all which space nothing is to be seen but ordinary villages, mostly seated on the banks of that great river. They do not shave their heads like the subjects of the empire of China, but wear their hair tied behind. Those who live at the mouth of the river are frequently visited by boats from the islands, which are very numerous near the entrance, where it is near three leagues over, and every where deep and navigable, so that the largest vessels may sail up it at least five hundred leagues.

Beyond the Saghalian-ula is only a few villages inhabited by the Kecheng Tartars; and the rest of the country, being wild and desert, is only frequented by sable hunters. It is crossed by a chain of mountains, and is watered by several rivers. The Tuhura-pira springs from another chain of mountains in the fifty-fifth degree of north latitude, and is the point whence the rivers flow contrary-ways: thus the Udi-pira directs its course towards the Northern sea, and belongs to the Russians, while the Silimfi-pira passes southward into the country of the Kecheng Tartars.

But

But the river most celebrated in the history of the Manchews is the Songari-ula, which abounds with fish, and is large, deep, and navigable, without danger throughout its whole course; it being but moderately rapid, even at its confluence with the Saghalian-ula.

The mountain whence it springs is the highest in all Eastern Tartary, and may be seen at a vast distance, one half of it covered with woods, and all the upper-part white with sand, whence the Chinese imagine that it is always covered with snow. On the top are five exceeding high rocks, that resemble so many broken pyramids, and are continually wet with the fogs and vapours peculiar to this country. Between them is a steep lake, whence flow the stream from which the Songari takes its rise.

S E C T. III.

Of the Province of Tsitfikar, and the Cities of Tsitfikar, Saghalian-ula, and Merghen. Of the Solon Tartars, who are expert at hunting Sables, of the Pearl Fisheries on the Coast, and of the Language of the Manchews.

THE third province of Eastern Tartary is that of Tsitfikar, which is bounded on the west and on the side of Russian Tartary by two rivers, both of which fall into the Saghalian-ula. The capital of this province is also named Tsitfikar, and is situated in forty-seven degrees twenty four minutes north latitude, near the Nonni-ula, a considerable river that falls into the Songari, and is inclosed by a strong palisado that is not very high, but is lined with a pretty good rampart. The garrison chiefly consists of Tartars; but most of the inhabitants are Chinese, who are settled there for the sake of trade, or have been banished thither for their crimes. The houses of both nations are without the palisado, which incloses little besides the tribunals and the palace of the Tartarian general: they are built of earth, ranged into pretty wide streets, and are all inclosed by a mud wall.

The jurisdiction of the government of Tsitfikar extends over the new cities of Merghen and Saghalian-ula. Merghen, which is about forty leagues from Tsitfikar, is much thinner of people than that city, and is inclosed with a simple wall. The lands belonging to the two last cities are sandy and barren, but those of the Saghalian-ula yield good crops of wheat.

The city of Saghalian-ula stands on the south side of the river Saghalian, and is as populous and as rich in commodities as Tsitfikar. The lands about it have several Manchew villages and large forests in which fables are hunted.

The skins of the fables caught in this country are highly esteemed by the Tartars for their wear and service. The Solon Tartars who hunt them are more robust, brave, and skilful than the other inhabitants of these parts; and even their women, who ride on horseback, draw the bow and hunt stags and other game. Many of these Tartars reside at Nierghi, a considerable town not far from Tsitfikar and Merghen. The missionaries saw them set out from thence, on the first of October, to hunt fables, when they were clothed in short straight jackets made of wolf skins, with a cap of the same, and their bows hung across their shoulders. They had some horses loaded with sacks of millet, and with long mantles of fox and tyger skins, in which they wrap themselves against the cold, especially in the night. Their dogs being trained to the exercise, climb well, and are acquainted with all the wiles of the fables. Neither the severity of winter, which here freezes the greatest rivers, nor their fear of the tygers, with which they are frequently obliged to combat, or the death of their companions, can deter them from annually returning to this painful and dangerous exercise, which they would certainly never do, if all their wealth did not consist in the furs they obtained. The finest skins are for the emperor, who pays a fixed price for a certain number of them. The others are very dear even in that country, and also extremely scarce, they being immediately bought up by the mandarines of those parts and the merchants of Tsitfikar.

In some of the rivers which fall into the Saghalian-ula are considerable pearl-fisheries, which are carried on without

much art. For as the water of these rivers is but shallow, they throw themselves in without fear, and taking the first oysters they can find, return with them on shore. The pearls are highly valued by the Tartars, and the emperor has several strings of them, a hundred or more on each. These pearls are very large, and exactly alike, but they are chose out of many thousands.

The language of the Manchew Tartars is very different from that of the Chinese, and there is not a Tartar of this country who does not think it the most elegant and copious in the world. They have the advantage too of the Chinese in having an alphabet, by which they can with ease express their thoughts in writing; in which they commonly use an hair pencil, though some make use of a kind of pen made of bamboo, cut almost like those used by us.

S E C T. IV.

Of the Islands that lie to the East of the Country of the Manchews, particularly of the Land of Jesso, and other of the Kurilski Islands that extend in a Chain from the North of Japan to the Southern Promontory of the Peninsula of Kamtschatka.

OPPOSITE to the mouth of the Saghalian-ula; which falls into the sea at the point of a large bay, in fifty-two degrees fifty minutes north latitude, is a great inhabited island, which extends four degrees thirty minutes from the north-east to the south-west; but its produce and the manners of the people are yet unknown.

On the west side of it, near the main land, are many small islands; and between the fifty-fourth and fifty-fifth degrees of latitude lie the Shantar islands, the most considerable of which is Shantarskoy, which abounds not only in wood, but in many different animals, particularly foxes, fables, ermines, and bears. The principal fowl are swans, ducks, and geese. Several sorts of fish are found in the bay, and different kinds of berries in the fields.

The rest of the isles on this coast are very inconsiderable, except the Kurilski islands, which extend north-east from Japan, and reach to the most southern promontory of Kamtschatka. The exact number of these islands is unknown, but they are supposed to amount to twenty-two; yet by the account of captain Spanberg, a Russian, who sailed from Kamtschatka to Japan, there appears to be many more. The islands lying nearest to Japan, and consequently in a more favourable climate, are the most fruitful, and abound with trees of various kinds, among which are lemons, bamboo, Spanish canes or reeds, and poisonous herbs, whose roots are as yellow as saffron, and as thick as rhubarb, and are well known to the inhabitants of the farthest Kurilski island, who formerly purchased them of the natives, in order to poison their arrows with the juice.

The first of these islands which is almost circular, and extends from the forty-first to the forty-second degree of latitude, is divided from Japan by a small channel less than twenty miles broad, and by one still narrower it is separated from the south-east of Eastern Tartary. In this island, which is named Matma, the Japanese have a strong guard at the south-west point, probably to defend the country from the Chinese and Koreans. Not far from thence, upon the shore of the channel which separates Matma from Japan, is a Japanese city, of the same name with the island, where are kept muskets, cannon, and ammunition for its defence, and where was lately built new fortifications. Most of the Japanese settlements upon this island were made by people banished thither. The channel between the island and Japan is extremely dangerous, on account of the rocky capes projecting into it from both sides, and from the rapidity of the flood at ebb and flow.

This island and Kunatir, which is separated from it only by a small channel, together with two others, named Eturpu and Urupe, according to the new discoveries made by the Russians, constitute the land of Jesso, or Jedso, which has been so variously laid down in the European maps.

Upon the island of Kunatir are great numbers of pine, larch, and fir-trees; but there is a scarcity of good water. There are here wild animals in abundance, particularly bears, whose skins are used by the inhabitants for cloaths.

The

The natives also wear long silk cloaths, like the Chinese, and have long beards; but pay little regard to cleanliness. They feed on fish and whales fat, and lie upon the skins of wild goats, of which there is great plenty in the island. Though they live near Japan, they acknowledge no sovereign. The Japanese come to them every year in their small craft, bringing all sorts of iron-ware, copper pots, japanned waiters and bowls, leaf tobacco, and silk and cotton stuffs, which they exchange with them for the skins of foxes and whales fat. The natives of Kunatir bid the Russians who come thither beware of the inhabitants of the island of Matma, because they had cannon; asking them, at the same time, whether they came from the north, and if they were those who are famous for their armies, and able to wage war with and conquer every nation.

The Eturpu and the Urupe islands are situated next to Kunatir, and are called by Spanberg the Green and Orange Islands. The natives, who call themselves Keek-Kuriles, resemble those of Kunatir. There is safe anchoring in the mouths of the rivers for large ships, particularly in the island Eturpu. To these two islands Japan silk, cotton stuffs, and utensils, are brought by the natives of Kunatir, who purchase them from the inhabitants of Matmar. On the other hand, the natives of Eturpu and Urupe make cloth of nettles, which they sell to the Japanese: they also sell to them all sorts of furs, which they have among themselves, and which are also brought to them from the islands near Kamtschatka; likewise dry fish and whale's fat, and these are said to be carried to Japan.

Of the other islands we find nothing remarkable, till we come near to Kamtschatka, except that the uninhabited island named Araumakutan has some burning mountains: we shall therefore only describe the two nearest to that peninsula. These are Schumtschu and Paromusir.

The former of these islands is divided from the northern extremity of Kamtschatka by a channel fifteen versts, or Russian miles, in breadth, and is situated within the fifty-first degree of north latitude, extending in length from the north-east to the south-east fifty versts, and in breadth about thirty. Schumtschu is full of mountains, from which, and the small lakes and marshes, flow many little rivers into the sea. In some of these are found different kinds of salmon and other fish, but not in such plenty as to furnish the inhabitants with provisions for winter.

Paromusir is twice as large as Schumtschu, from which it is separated by a channel not two miles broad; but no vessel can lie in it without danger, there being no good anchorage, and the shore is steep and rocky. This island is also mountainous, and has as many lakes and rivulets as the other; but on both is no other wood than the slanetz and ernick, which are used by the inhabitants for fuel; and they build their huts with different kinds of trees, which they find thrown on the shore by the waves from America and Japan. Between the inhabitants of these two islands, and those nearest Japan, a commerce was formerly established, when those of the remote islands brought to them all sorts of varnished wooden-ware, scymitars, silver rings, which they wear in their ears, and cotton cloth; and from them they chiefly took in return eagles feathers, which were used in pluming their arrows.

Both these islands are subject to frequent and terrible earthquakes.

For this account of the Kurilski islands we are obliged to the History of Kamtschatka, translated from the Russian tongue by James Grieve, M. D. a work of singular merit, which contains many important discoveries and many entertaining particulars.

C H A P. V.

Of the Country of the MONGOLS and KALKAS.

S E C T. I.

1. *Of the Country of the MONGOLS.*

Its Situation and Extent. The Climate, Soil, and Animals. The Persons and Drefs of the Inhabitants. Their Tents, Food, Manners, Customs, Government, Trade, and Religion.

THE country of the Mongals, Mongols, or Monguls, called by some of our European geographers Mongolia, is divided into several different tribes of Tartars; but we shall here only treat of the Mongols, properly so called, and of the Kalka Mongols. The territories of the former are bounded on the east by the country of the Manchews, on the south by the wall of China, on the west by the desert of Kobi and the country of the Kalkas, from which it is separated by the limits fixed by the emperor of China, and on the north by the Kalkas and part of Eastern Tartary. This is a country of very great extent, it being situated between the thirty-eighth and forty-seventh degrees of latitude, and between the eighty-eighth and one hundred and forty-second degree of east longitude from London; so that it is three hundred leagues in length from east to west, and about two hundred in breadth from north to south.

This part of Tartary has been the scene of the most extraordinary actions, for here the great empire of Jenghiz-Khan and his successors had its rise and seat: here were founded the empires of Kitay and Kara-kitay: here all the riches of Southern Asia were carried and dissipated; and here many populous cities flourished, of which there are now scarce any remains, and in them the arts and sciences were once cultivated.

The country inhabited by these Tartars is extremely cold, even in the places under the same latitude as France; for in winter the ground is frozen eight or nine months together, which Gerbillon attributes to its elevated situation, there being a continual descent from Tartary towards

China, which fully appears from the rapid course of the rivers; this is doubtless the principal reason, though, as he justly observes, other circumstances may contribute to it, as the great quantity of salt and salt-petre mixed with the sand in the country of the Mongols and in the territories of the Kalkas, the great number of mountains covered with wood, and the immense space of desert and uncultivated land that reaches from the North Sea to the borders of China.

The country is in general unfit for tillage; but there are some fertile spots, which to all appearance would richly reward the labour of the husbandman; and, at the same time, afford the most beautiful landscapes. Here are mines of excellent tin, with large forests of fine timber, which is sent even to Pekin for the use of building; hence the river which runs to that city is generally in a manner covered with large rafts of fir wood.

The inhabitants wander from place to place with their flocks, encamping where they find most convenience for themselves and cattle: in summer they commonly choose the open country near some lake or river; or for want of these, encamp about some wells: but in winter they retire to the sides of the hills and mountains, or behind some eminence, where they may be sheltered from the north wind; and at that time the snow supplies them with water.

Agriculture is not only neglected by them, but even condemned as useless; for when the missionaries asked the natives, why they would not at least cultivate some little herb-gardens, they replied, "Herbs are for the beasts of the field, and the beasts for men."

There are several medicinal plants in this country, and particularly rhubarb.

Their tame cattle consist of camels, horses, cows, and sheep, whose tails are about two feet long, and near as much in compass, commonly weighing between ten and eleven pounds, and each is almost one entire piece of fat; the

the bone being no larger than that of other sheep: but these are not peculiar to Tartary, they being found in many other countries. The natives breed no beasts but what eat grass.

In this country are hares, pheasants, and all the sorts of game common in Europe. The deer, which multiply exceedingly in the deserts and forests, differ in colour, size, and in the shape of their horns; but some of them resemble those of Europe.

The stag-call is a diversion that has been much admired by some of the emperors of China when they came into this country, and is thus performed: the huntsmen taking some stags heads repair into the forest before sun-rise, and counterfeit the cry of the hind; upon which the largest stags advance near the place where they hear the cry, and stopping, look around, till at length perceiving the stags heads they tear up the ground with their horns, and instantly run forwards; but are immediately shot by some who lie in ambush.

Yellow goats appear in the plains, but are seldom seen except in large herds; they are extremely swift, and of the shape and size of common goats; but their hair is yellow, and not so smooth.

Wild mules appear in small herds, but are not like the tame ones, nor can be brought to carry burdens; their flesh is very different and of an agreeable taste, and the Tartars, who feed much upon it, are of opinion that it is as nourishing as the wild boar's. This last animal, which frequents both the woods and plains, is traced by the earth it turns up to come at the roots on which it feeds.

The wild dromedary and horse resemble the tame; the latter is so fleet, that the swiftest hunters can seldom reach it with their arrows. These wild horses appear in large herds, and when they meet with those that are tame, surround and drive them away.

There are here a kind of elks bigger than the largest ox; but they are found only in particular districts and in boggy grounds in which they delight, and where they are most easily killed, their great weight hindering their flight.

The chalon, or chelason, is about the size of a wolf, and seems a kind of linx. The skin is much valued at Peking, where they make use of it for their upper garment. It has long soft hair of a greyish colour.

The tygers are the fiercest of all the animals of Tartary: their howling alone strikes terror into those who are unused to it. Those of this country are very large and nimble: their skins are commonly of a fallow red, and striped with black lists. Though these animals are so fierce, they seem in great fear when they find themselves surrounded by the hunters presenting their spears; and while the deer driven along fly from side to side, in order to escape, the tyger squats on his tail, in the spot where he first sees his enemies, and for a long time bears the barking of the dogs and the blows he receives from blunted arrows; but at length, thoroughly provoked, he springs forward with such rapidity, that he seems to make but one leap to the hunters on whom his eyes are fixed; but those who are near them are ready with their spears pointed, and plunge them into his belly the moment he offers to seize one of their companions; and indeed the emperor's hunters are so quick, that an accident very seldom happens.

The intrepidity of the Tartarian horses when encountering the tygers is very surprising, and yet this only proceeds from use; for they are at first as fearful of them as other horses. The Mongols are very expert in training them, and have a great number of every colour. They are particularly dexterous at catching them when running, with a cord made into a slip-knot; and they are also very expert in breaking of them: they likewise understand their distempers, but generally use such remedies as would be far from agreeing with our horses. They prefer strength and hardness to largeness and beauty. The Tartarian horses are indeed not small, but rather of a middle size, and amongst such vast numbers many are found as large and handsome as the European.

The paus are a kind of leopards, with whitish skins, adorned with red and black spots; but they have the head and eyes of a tyger, though they are not so big, and have a different cry.

There are plenty of squirrels, foxes, and a creature as small as an ermine, of whose skins mantles are made at Peking to keep out the cold. There are a kind of land rats, very common in some of the territories of the Kalkas; these live in companies, and dig in the earth a range of as many little holes as there are males among them, one of whom always keeps watch, but flies under ground at any one's approach: yet they cannot easily escape the hunters, who, on discovering the place where they burrow, surround it, and opening the earth in two or three places, throw in flaming straw to frighten them out, and thus great numbers are taken.

In some of the rivers is found an amphibious creature resembling the otter; but the flesh is tender, and almost as delicious as that of the roe-buck.

In the plains of Grand Tartary are a great number of birds of extraordinary beauty, particularly a kind of heron, found in the country of the Mongols towards the frontiers of China. It is all over white except the wings, tail, and beak, which are of a very fine red; the flesh is very delicate, and in some measure resembles that of the woodcock.

The fishery of the Mongols is inconsiderable, for their rivers do not abound with fish like those of the Manchews.

As to the rational inhabitants, they are of a middle size, but strongly made, their faces are very large, their complexion sun-burnt, their eyes black and full, and their noses flat. They have very little beard, and yet their black hair is as strong as that of a horse; but they cut it pretty close to the head, and preserve only a tuft at the top, which they suffer to grow the natural length.

They wear very large shirts and drawers made of calicoe; and their habits, which are also made of calicoe, or some other light stuff, reach as low as their ancles, and are lined with sheep skins. Sometimes they wear entire garments of lamb and sheep skins, with the wool next the body; and this is indeed their usual cloathing: these garments they fasten about their limbs with great leather straps. They have very large boots made of Russia leather, and small round bonnets, with a border of fur four fingers broad. The women dress in much the same manner, only their garments are longer, their boots generally red, and their bonnets flat and adorned with some little ornaments.

Though they know how to dress and whiten these skins, as also those of wild goats and deer, which serve the rich for under garments in the spring; yet as soon as you come near them they smell so strong, that they go under the name of stinking Tartars, and their very tents are extremely offensive.

Their arms consist of a bow and arrows, the sabre, and pike; and they always go to war on horseback.

They live in tents, or little moveable houses, a number of which are frequently placed together in a valley, and resemble a village. Each tent is a sort of cage, made of a circular form of pretty small sticks, and are about thirteen or fourteen feet in diameter. Some are greater and others less; but they are generally of about this size. In the middle the tent is about eight or nine feet high; and the roof begins at about four feet from the ground, and ends in a point like the top of a round tower or a pigeon-house. These tents are covered with different pieces of felt, made of wool pressed and matted together. When they make a fire they take away a piece of stuff from the top of the tent, directly over the place where the fire is to be lighted. They are warm enough while the fire lasts, but soon grow cold; and in winter the Mongols would, without care, freeze in their beds. To lessen this, and other inconveniences, their tent-door is very narrow, and so low that they cannot enter in, without stooping.

Gerbillon, a French missionary, who entered one of these tents, saw upon the fire three or four pieces of flesh, but of what kind he could not tell; however, the sight of it turned his stomach. The whole furniture was three or four boards, on which they lie, with a piece of the same felt with which the tent was covered, that served both for bed and coverlet; a bench, a forty press, and a few wooden dishes.

Their diet is very simple; in summer they feed on milk, using indifferently that of cows, mares, ewes, goats, and camels. Their drink is water boiled with the worst sort of Chinese tea, in which they put cream, butter, or milk. They also draw a spirituous liquor from sour milk, especially

cially mares, which is distilled after fermentation; into this sour milk the rich put mutton while it is fermenting. With this spirituous liquor they are fond of being intoxicated. They also smoke a great deal of tobacco.

They eat their flesh almost raw, and, as they do not understand tillage, they eat with it neither bread nor rice.

In short, they are natty and slovenly both in their food, their tents, and cloaths, and unpolished in their manners; living amongst the dung of their cattle, which serves them for fuel; for in great part of their country not a tree nor a bush is to be found. They are excellent in horsemanship and hunting, and very dexterous in drawing the bow, either on foot or on horseback; and therefore prefer grazing and hunting to the fatigue of tilling the land.

The utmost ambition of the Mongols is to preserve the rank of their families. They value things only for their use, having no great regard to their scarceness or their beauty. They are naturally of an easy cheerful temper, always disposed to laughter, and never depressed by care and melancholy. Indeed they find little occasion for inquietude; for they have neither lords to please, nor enemies to fear; they know none of the perplexities that attend the management of difficult affairs; and have no business to transact, nor any constraint put upon their desires. Their sole employment is attending their herds and flocks, and their principal diversion is hunting, fishing, and other bodily exercises, at which they are very expert.

Though the Mongols, the Kalkas, and other Tartars, are distinguished into different nations, yet they have all one language, called the Mongul tongue: they have several dialects indeed, but they understand each other. We are informed by Regis that the characters upon the monuments of the ancient Mongols are the same with those now in use; but differ from the Manchew. They have not the least resemblance to the writing of the Chinese, and are no more difficult to learn than the Roman. They are written on tables with an iron pencil, and therefore among the Mongols a book is a great rarity. In order to please them, one of the emperors had a translation of some of their authors printed at Peking. The chief book among them is the Chinese Kalendar, engraved in Mongol characters.

As to the government of the Mongols, they are divided into forty-nine ki, or standards, each of which has a separate tract of country, and a particular prince or leader. Every prince is obliged to keep within the bounds of his own dominions; for neither he nor his subjects are permitted to pass with their flocks and herds into those of another, since that would be esteemed an act of hostility; but in their own territories they encamp where they please, and where they find it most convenient on account of water and pasture.

Their princes have a politeness that distinguishes them from their subjects, who, notwithstanding their calling themselves their slaves, are not treated with severity, but have free access to them on the slightest occasions. This familiarity, however, does not diminish their respect; for they are taught from their infancy, that they are born to obey, and their masters to command.

Though polygamy be not forbidden, the Mongols have usually but one wife.

They burn their dead, and then inter the ashes on some eminence, piling a heap of stones over the grave, on which they place a number of little flags or standards.

With respect to commerce, the Chinese resort to those of the Mongols, who are situated near that empire, bringing them ordinary bohea tea, rice, tobacco, coarse cotton cloth, and other ordinary stuffs, with several sorts of household utensils; and as the Mongols are not acquainted with the use of money, they give cattle in exchange for these commodities.

The Mongols are said to be worshippers of the idol Fo, and pay an implicit obedience to their lamas, or priests, to whom they present the best things they have. These priests are commonly ignorant; and those of them are esteemed very learned who can read the sacred books in the language of Tibet. They are indeed the only persons capable of giving instructions to their countrymen; but

they find it more for their advantage to go from tent to tent, repeating certain prayers, for which they have a salary, and to practise physic, in which they pretend to have great skill. The Mongols therefore wanting masters, very few of them have an opportunity of learning to write or even to read. Several of the lamas themselves scarce understand their prayers which they sing in a solemn, yet harmonious manner. The people often kneel bare-headed before them, and do not rise till they have laid their hands upon them. They do not believe the transmigration of the soul into brutes, and therefore eat flesh; but though they have large flocks of tame cattle, they mostly feed on the wild beasts they take in hunting.

The Mongols are remarkably devout, and almost every one of them wears a string of beads about his neck, on which he repeats his prayers. There is scarce a Mongol prince but has a temple, though he has no other house in his territory. Gerbillon saw the ruins of one of them at about two hundred and fifty leagues from Peking; and, notwithstanding the distance, it was erected by Chinese workmen hired on purpose; and the tiles, which were enamelled with yellow, were brought from that city.

One of the Mongol princes, well versed in the history of his ancestors, informed Gerbillon, that in the reign of the emperor Cublay there came lamas into the country of the Mongols, and planted their religion: and that they were men of learning and irreproachable lives. Gerbillon thinks it probable that those lamas were Christian monks, who came from Syria and Armenia, and preached Christianity both to the Mongols and Chinese; but that the communication with their countries being afterwards cut off, the bonzes blended their superstitions with the customs introduced by these monks, and by degrees introduced the religion of Fo. This, he says, is the more probable, as these lamas have many ceremonies and customs like those observed among Christians. They have holy water, a singing service, and pray for the dead; they use beads, and wear a mitre and cap like bishops. Nor to mention their grand lama, to whom they pay a veneration at least as great as is paid by the Roman church to their sovereign pontiff.

At the head of these Mongol lamas is a deputy, under the name of lama of Tibet, and is called the Khutuktu.

S E C T. H.

Of the KALKA MONGOLS.

The Rivers on which they dwell. Their Government and Religion.

OF all the Mongol nations that depend on the emperor of China, the most celebrated, as well as the most numerous, are the Kalkas, who obtained their name from the river Kalka. They extend above two hundred leagues along the country, from east to west, on the banks of the finest rivers in this part of Tartary. They dwell beyond the Mongols, and have the Kalmucks on the west; and from north to south extend from the fiftieth and fifty-first degree of latitude to the southern extremity of the great desert of Kobi, which belongs to them, and affords fine pastures, woods, springs, and rivulets; though in some parts it is quite bare, without trees, grass, or water, except some ponds and marshes made by the rains and a few wells, the water of which is very bad.

The river Kalka is not much frequented by the Kalkas, though they take their name from it. It flows from a famous mountain called Siolki, sixty-four leagues from Tshikar, and runs into a lake called Puir. The other rivers are,

The Kerlon, which is almost every where fordable; it is about sixty feet in breadth, and washes the richest pastures in all Tartary. The waters of this river are good; and abound with trout and other fish.

The Tula runs from east to west, and in most places is larger, deeper, and more rapid than the Kerlon. It has more woods and finer meadows, and on its north side are mountains covered with large firs that afford at a distance an agreeable prospect. This river, having joined the Or-gon, which comes from the south-west, runs towards the north,

north, and after increasing its stream by the addition of others rivers, as the Selinga, at length falls into the Paykal, which belongs to the Russians, and is the greatest lake in all Tartary.

The waters of the Twi, which are clear and wholesome, after a long course through fertile plains, sink into the ground near a small lake, and appear no more.

The Selinga issues from a lake called by the Mongols, Koso, and proceeding from south to north, through very fertile plains, is enlarged by many rivers on both sides, and at length discharges itself into the lake Paykal. Its waters are very good and light, but have few fish.

The river Siba has its spring in the mountains towards the frontiers of the Kalmucks, and running east-north-east loses itself north of the desert of Kobi.

The Dzunmuran has its source in the mountains which cross the desert of Kobi, and running south-east falls into the Whangho on the frontiers of Tibet. Two petty khans of the Mongols, under the protection of the emperor of China, reside on its banks.

The river Argun rises in a lake of the country of the Mongols, and having pursued its course towards the north-east, runs above one hundred leagues, and at length falls into the great river Sagalian-ula.

The persons, manners, customs, and way of life of the Kalkas, are nearly the same as those of the Mongols; but the Kalkas pay obedience to one khan, who was once the great khan or emperor of all the Mongols. Indeed since the Manchews have given emperors to China, the khan is fallen from his ancient grandeur; yet he is still very powerful, as he can easily bring into the field an army of sixty thousand horse; and though he puts himself under the protection of the emperor of China, instead of paying him tribute, he annually receives from that emperor presents of skins.

The Kalkas, as well as the Mongols, have a high priest called the khutucktu at the head of their religion; but he is not subject to the dalay-lama. This prince of the lamas dwells in tents, in the largest of which he sits on a kind of altar, and receives the homage of many nations, without returning the salute of any person whatever. All consider him as something more than man, and pay him the same kind of adoration as to Fo himself. The people are so infatuated, that they believe he knows all things, and can absolutely dispose of the favours of Fo. Regis, who saw the person who then assumed this character, was told, that he had already been born fourteen times, and would be born again when his present time was expired. The missionaries pretend, that they reproached him, in the presence of several Mongol princes, for being the object of a foolish idolatry, and threatened him with the judgments of God and eternal torments; but he heard all with great coolness, and continued to receive the adorations that were offered to him.

The high opinion the Mongols entertained of him at that time drew crowds of people to Iben-pira, where he had resided near twenty years. The place resembled a large city formed of tents, and the hurry was much greater there than any where else in that part of Tartary. The Russians of Selinghinshoy traded thither; there were also bonzes from Indostan, Pegu, Tibet, and China; Tartars from the remotest countries, with multitudes of lamas

of all ranks: for they are of different degrees, though they all acknowledge as their chief the great lama of Tibet.

Bentinck observes, that this khutucktu was formerly sent by the dalay-lama to the Mongols and Kalmucks of the north to keep up his authority in those parts, on account of their being too remote from his usual place of residence; but this deputy having once tasted the sweets of spiritual command, made bold to set up for himself, which he did with such address, that some time after scarce any mention was made among the Mongols of the dalay-lama; and the authority of the khutucktu became so well established, that whoever dared to doubt of his divinity would be held in abhorrence by all that nation.

The court of China had indeed a great hand in this new apotheosis, in order to divide the Mongols from the Kalmucks, and therefore under-hand supported the khutucktu against the dalay-lama.

Whenever the khutucktu removes his camp he is surrounded by a great number of lamas and armed Mongols, who flock from all parts with their families to meet him on the road, and receive his benediction, on paying the fees. None but the heads of tribes, and other persons of distinction, dare presume to approach him. He gives them his benediction by applying his hand shut upon their forehead, in which he holds a string of beads.

The vulgar are persuaded, that he grows old as the moon declines, and young again with the new moon. At the sacred ceremonies he appears at the sound of instruments, that resemble trumpets and cymbals, in a magnificent pavilion, covered with China velvet, and open in front. He is seated cross-legged, after the Tartar fashion, upon a large velvet cushion, having on each side a figure representing an idol. The lamas of distinction are seated on both sides on cushions, from the place where he sits to the entrance of the pavilion, each reading in a book they hold in their hands.

The khutucktu is no sooner seated than the instruments of music cease, and all the people assembling before the pavilion prostrate themselves on the earth, uttering exclamations in honour of the divinity and in praise of the khutucktu. Some lamas afterwards bring censers of odoriferous herbs, and offer incense first to the idols, then to the khutucktu, and lastly to the people. Afterwards laying the censers at the khutucktu's feet, they bring China-bowls with liquors and sweet-meats, seven of which they set before each representation of their god, and seven others before the khutucktu, who tastes them; and having eaten a little, causes the rest to be distributed among the heads of the tribes who are present, and then retires with the sound of instruments into his tent.

The khutucktu, to preserve his independency on the dalay-lama, makes presents of furs to the emperor of China's favourites; and as the court at Peking finds that the khutucktu and his lamas, are necessary to keep the Mongols of the West in their duty, they take care to treat him on all occasions with marks of great respect. The khutucktu also strives to cultivate a friendship with the Russians, by favouring the subjects of Russia in their little quarrels that sometimes happen between them and the Mongols on the frontiers.

O F S I B E R I A.

S E C T. I.

Of Siberia in general. Its Situation, Extent, Climate, and Face of the Country, particularly of the Eastern Part. Its principal Rivers and Minerals with a Description of a very remarkable Kind of Ivory found in the Banks of the Rivers.

ON the north of the countries last described is Siberia, a region of prodigious extent, that reaches from the river Saghalian-ula, which bounds it on the south, in the latitude of fifty-five degrees, to the Frozen Sea, which bounds it in the north; and on the west is parted from Russia by the mountains of Werkhotauria, which form a chain that may be considered as a branch of Mount Caucasus: these commence to the southward, and separate Asia from Europe quite to the Frozen Sea. From these mountains, which are in about fifty-eight degrees of east longitude, Siberia extends to the Eastern Ocean, which in some places washes the coast in one hundred and forty-eight degrees of east longitude from London; but farther north the country stretches out (according to the late discoveries made by the Russians) above forty degrees farther to the east, as if to meet the new discovered coast of America, which is found to reach almost to Siberia. In short, this vast country is above three thousand miles in length from east to west, and about seven hundred and fifty miles in breadth from north to south. But it is extremely cold and barren, and every where thinly peopled. A very accurate description of a region so widely extended, and so little known to the Russians themselves, cannot be justly expected. We have, however, made use of the latest and best discoveries; and have not only consulted the account of this country given by Mr. Strahlenberg, a Swedish officer, who was thirteen years captive in those parts, but the late journey into Siberia by the Abbé Chappe d'Aute-roche, for observing the transit of Venus over the sun, and the curious and judicious discoveries and observations made by some of the learned of Russia on the nations near the coast of the Eastern ocean, which have been lately examined with great attention, particularly by Mr. Steller and Mr. Krascheninickoff, who have given a judicious description of the peninsula of Kamtschatka.

The face of the country, especially towards the north-west, is as disagreeable as can be imagined, it being covered with large and almost impenetrable woods, with high and frozen mountains covered with everlasting snow, and with fens, lakes, and marshes. The climate is therefore in general cold, but more moderate in the southern part, and where the lands do not rise a considerable height above the level of the sea, which is frequently the case even of extensive plains. To these dreary countries the czars of Muscovy send the great men who are so unhappy as to displease them; and hither Peter the Great, in particular, sent many of the brave Swedes who had the misfortune to be taken prisoners by that monarch. These set up schools, and introduced the arts and sciences amidst nations of savages.

The horrors of part of these solitary regions have been described in very strong and lively colours by the Abbé Chappe d'Aute-roche. The chain of mountains called Werkhotauria, which form the western boundary of Siberia, are, says he, no higher than from fifty to eighty fathoms; but the declivity is very steep, and the summit is covered with pine, fir, and birch trees. The road over these mountains is very frightful, and by night extremely dangerous; for should the sledge in which the traveller is seated deviate ever so little from the beaten tract, he will inevitably be buried in a gulph of snow; which, when the Abbé passed this way, was ready to melt, and yet the tallest firs were so loaded with it as to bend under the weight. Every where upon the ground it was seven feet thick, and there was no sign of the returning spring, not

so much as by the flight of a bird; for the very pyes and crows, which abound through all Russia, abandon these horrid deserts, where nature herself seems benumbed, and it is only by the traces of the sledge that the country is known to be inhabited. The gloom of desolation spreads on every side, and the horrid silence is never broken but by the outcries and complaints of those that suffer from the perils of the way.

The inhabitants are shut up in their huts nine months in the year; for the snow falls on the mountains in the beginning of September, and such a quantity soon descends as to leave upon them scarce any traces of a habitation. It seldom begins to thaw there till the middle of April; but this happens somewhat sooner in the plains, yet it does not entirely disappear till the end of May; so that the severity of winter is suspended only three months. The Abbé crossed these mountains, which extend forty-five leagues in breadth from east to west, and then descending into a large plain, found the climate so much altered, that in some places the snow scarcely covered the surface of the ground; the thaw was already begun on the rivers, and on the tenth of the same month the ice broke.

In this country are several rivers of prodigious extent, the principal of which are the Oby, the Jenisai, and the Lena.

The Oby issues from the lake Altin, in Calmuc Tartary, and running north, is joined by the Irtish, and at length, after traversing a tract of above two thousand miles, it discharges itself into a bay of the Frozen Sea. This river abounds in fish; it is navigable almost to its source; and, through a great part of its course, is between five and six hundred yards broad.

The Jenisai, or Jeniskoi, is a very large river, which towards its mouth overflows its banks every spring for several miles. It has its course from some lakes near the mountains south of Siberia, and, after running a course of sixteen hundred miles, forms a large lake or bay, which contains several islands, and at length falls into the Frozen Ocean to the east of the Oby.

The Lena is a large river on the eastern part of Siberia. It issues from the north side of the lake Baikal, and, after traversing a vast tract of country, divides itself into five branches, three of which continue their course to the westward, and the other two to the eastward; after which they all fall into the Frozen Sea.

In this country are mines of gold, silver, copper, and excellent iron; also jasper, lapis lazuli, and loadstones.

But the most surprising production of Siberia is a kind of large teeth, found near the mouths of the rivers Oby, Jenisai, and Lena; and also in the banks of many other rivers. They are of different sizes; Mr. Strahlenberg says, he has seen some of them above four Russian ells long, and at the thickest part nine inches in diameter. They resemble elephants teeth, only are somewhat more crooked; and, on being cut, can only be distinguished from ivory by their being somewhat more yellow, which only happens when they have lain a pretty while exposed to the air. Sometimes they are brown, and sometimes of a bluish black, which proceeds from the same cause; and then if they are sawed into thin leaves, and polished, you may observe upon them landscapes, in which appear trees, men, and beasts; and the more they are decayed, the greater variety or figures are found upon them. They make of them snuff-boxes, combs, and a thousand other things that are usually made of ivory; thin leaves, made of the part that is not quite mouldered way, serve to inlay and cover small boxes and little cabinets; and a considerable number, which are white, are carried into China, where they are sold at a good price.

Many are the conjectures that have been formed in relation to these bones; some suppose them to be the real elephants teeth that have lain there ever since the general deluge; others imagine them to be the teeth of the sea-horse,

Inside View of a Winter's Hall of the Kamptobadles.

horse, or other amphibious animals that may have come from Greenland, and been driven up the rivers; and, at the fall of the waters, left in the mud.

In short, Siberia has many animals unknown in Europe, and is inhabited by many different nations, that have different manners, customs, languages, and religions. We shall now therefore be more particular, and give a more perfect description of these extensive regions, beginning at the East.

S E C T. II.

Of KAMTSCHATKA.

Of its Situation, Extent, Climate, burning Mountains, and Minerals.

WE are now entering upon the dominions of Russia, and shall give a particular description of the great peninsula of Kamtschatka, which forms the boundary of Asia to the north-east, and extends from north to south about seven degrees thirty minutes. The southern part of this peninsula is situated in fifty-one degrees north latitude, and its longitude from Peteribourg is found, by the best observations made upon the spot, to be one hundred and twelve degrees east of Peteribourg, and consequently in the longitude of one hundred and forty-three degrees sixteen minutes east of London. The figure of this peninsula is somewhat elliptical. It is bounded on the east by the Eastern Ocean, which separates it from America; on the west by the Penschinka, which begins near the southern point of the Cape of Kamtschatka; and runs northward between the western coast of Kamtschatka and the coast of Ochotskoy above one thousand versts, or Russian miles. A range of hills extend from north to south through the peninsula, dividing the country into two almost equal parts, and from these hills others extend to the sea, between which are the courses of the rivers.

The Russians give the name of Kamtschatka to the whole peninsula, though among the inhabitants it has no general appellation; but every part of the country receives its name from the natives, or something remarkable observed in it; and even the Russian Cossacks settled there understand by Kamtschatka, only the country situated near the river of that name, and distinguish the other parts of the country by the following appellations:

The southern part is called the Kurilski Country, from the Kuriles its inhabitants.

What is termed The Coast, extends along the western shore from the Bolscheretski, or the Great River, to the Teghil.

Awatscha extends from the Bolscheretski to Fort Awatscha, by the Bay of St. Peter and Paul, on the Eastern Coast.

Koreka is thus named from the Koreki, its inhabitants, and extends from the north of the Kamtschatka to the Teghil.

Ukoi is the Eastern Coast from the river Ukoi.

Teghil is the Western Coast from the river Teghil.

The principal rivers are the Kamtschatka, the Great River, the Awatscha, and the Teghil, on all which the Russians have settlements.

There are also several lakes of considerable extent.

In this country the time of harvest and winter take up above half the year, for the spring and summer scarcely last four months; the trees usually begin to bud at the end of June, and some of them begin to drop their leaves in August. The winter is however moderate and constant, and the frosts are neither extremely severe, nor the thaws sudden. The weather in spring is pleasanter than in summer, for though it sometimes rains, yet there are now and then fine clear days. But the force of the sun reflected from the snow in this season is so very great, that the inhabitants are as swarthy as the Indians, and have their eyes spoiled by it. To prevent these inconveniences as much as possible, they generally wear something over their face filled with small holes or nets of black hair, to lessen the number of the rays that would otherwise fall upon their eyes. This is owing to the great winds, which drive the snow so close, that it is almost as hard and solid as ice; and, instead of allowing the rays of the sun to

penetrate it, reflects them with prodigious force on the delicate and sensible nerves of the retina.

The weather in summer is generally disagreeable, and for the most part rainy and cold, owing to the neighbouring mountains being covered with perpetual snow. In places distant from the sea the weather is very different, it being fine and clear from April to the middle of June: the rain does not begin till after the summer solstice, and continues till the end of August.

In the winter are deep snows, but seldom high winds; and when these happen, they are of short continuance. The weather is generally clear and agreeable in autumn, except at the end of September, when there are usually storms; and as the rivers have a very swift current, they are seldom frozen over before the beginning of November.

There are three burning mountains in Kamtschatka, which for many years have thrown out a continual smoke, but do not often burst into flames. The mountain of Kamtschatka, which rises from two rows of hills somewhat in the form of a sugar-loaf to a very great height, usually throws out ashes twice or thrice a year, sometimes in such quantities, that for three hundred versts round the earth is covered with them: the last conflagration began on the 25th of September, in the year 1737, and continued burning a week with such violence, that the mountain appeared to those who were fishing at sea like one red hot rock, and the flames that burst through several openings with a terrible noise, resembled rivers of fire. From the inside of the mountain were heard thunderings, cracking, and blowing like the blast of the strongest bellows, shaking all the neighbouring country: the nights were most terrible; but at last the conflagration ended, by the mountain's casting out a prodigious quantity of cynders and ashes, among which were porous stones and glass of various colours. The country is also very subject to earthquakes, which sometimes produce dreadful effects.

There are likewise several hot springs, and some rivers that never freeze.

Copper and iron ores have been found in several places, and native sulphur is gathered in different parts of the country: the sulphur brought from Olontofski, where it drops from the rocks, is fine and pellucid. On the mountains are sometimes found small crystals of a bright red; yellow pellucid stones, like corals, and semi-pellucid ones that are whitish are found near the springs of some of the rivers; and near Tomskoy are plenty of hyacinths.

S E C T. III.

Of the Vegetables and Animals of Kamtschatka, particularly of the Glutton, the Manati, or Sea-Cow, Seals, Sea-Cats, and Sea-Beavers.

THE most useful wood is that of a kind of cedar, white poplar, and larch tree, which are used both in building houses and ships. There are also the juniper, the pine tree, and many birch trees, which, upon the banks of a small river named the Bistroy, are so large, that captain Sponburg built a sloop with their wood, in which he made several distant voyages at sea; but the people in general make little use of them, except for building sledges. They have also the service-tree, the cherry-laurel, and the dog-briar. Among the shrubs and plants are the honey-suckle, cranberries, wortle-berries, barberries, bramble-berries, and bilberries.

Among the plants which serve for food is the shelmina: its root is blackish without and white within, and from it grow two or three stalks of about the height of a man; the leaves grow on long branches all over the stalk, their upper part is green and smooth, and underneath they are rough, and have reddish veins. At the top of the plant is a flower, like that of the service-tree. The root, stalk, and leaves are very astringent; but both the Russians and Kamtschadales eat them in the spring, and preserve the root for the winter, when they pound and boil it with water for a kind of gruel. It resembles in taste the pistacho-nut.

The utchichley has leaves like hemp; but the flowers resemble those of the ragwort. The leaves being dried

and boiled with fish, give the broth the same taste as if the flesh of the wild goat was boiled in it: they fry the root in the fat of seals, and esteem it very delicate food.

Bistort grows in plenty both on the hills and in the valleys; they eat it either fresh or dried, and pounded with caviar. It is not so astringent as that in Europe, but is juicy, and has the taste of a nut.

The kotkonja grows in great plenty on the banks of the rivers. Its root is as thick as one's finger, black on the outside, and white within. Two or more stalks arise from it of the thickness of a goose quill, and about ten inches high. On the top three oval leaves spread like a star, from the center of which rises a short stalk, which supports the flower. The cup consists of three oblong green leaves, and the flower of as many white ones. In the midst of the flower is the pistil, which is of a yellow colour. The fruit, when ripe, is soft, fleshy, as big as a walnut, and of an agreeable taste like a good apple. The fruit must be eaten as soon as gathered, for it spoils if kept one night. The root is eaten by the Kamtschadales, both fresh and dried, with caviar.

Barley and oats have been sowed in this country, and yielded very good crops; but cabbages and lettuces never grow to any head; and peas continue in flower till late in the harvest without yielding pods: but turneps and radishes grow very well.

They have several medicinal plants, which they use with success in several diseases. But we ought not to omit the zegate, which contains a poison of prodigious strength; for with the juice, squeezed from the root of this plant, they anoint the points of their darts and arrows, which renders the wounds they give incurable, unless the poison be immediately sucked out: if this be neglected, the wound turns blue and swells, and the patient dies within two days. Whales of the largest size, on being slightly wounded with a poisoned weapon, are unable to bear the sea; but soon throw themselves on shore, where they expire in great agonies, making a most terrible bellowing.

On the sea-shore grows a whitish plant resembling wheat, of which they make mats of different colours: these serve for coverings and curtains, and also for cloaks. They also make baskets and bags of it of different sorts. It likewise serves for thatch. The natives mow it down with a scythe, formed of a shoulder-blade of a whale, which they bring to a good edge by grinding it upon a stone.

A plant grows in the marshes resembling the cyperoides, which they dress with a double-toothed comb of bone, and then use it instead of linen to wrap up their children in the room of swaddling cloaths. It supplies the place of stockings, by being rolled about the legs; and, from the opinion that its warmth promotes fruitfulness, the women wrap it round their bodies. On their solemn festivals they bind garlands of it round the heads and necks of their idols.

But no plant is of more general use than nettles, of which they make thread and form their nets for fishing.

The grafs grows here above the height of a man, and so fast, that it may be mowed thrice in a summer. This makes but a coarse sort of hay; yet the cattle are large and fat, and have plenty of milk, both in summer and winter.

Besides these plants the Kamtschadales have many others, to all which they give names; and are so well acquainted with their several properties, with the different degrees of virtue they derive from the various soils and situations in which they grow; with the proper times of gathering the several fruits and other produce, as is surprising in such a nation of barbarians: hence they have this advantage above other people, that they can every where find food and medicine; and, from their knowledge and experience, are in little danger from the noxious plants.

The domestic animals of Kamtschatka are cows, horses, rein-deer, and dogs.

The riches of the country consist in furs, for the wild beasts are very numerous; among these are the rein-deer, wild and tame, fables, foxes, hares, ermines, marmottas, weazels, &c. Among the foxes are most of the different species found in other places, as the black, red, fiery, blue-breasted, or marked with a black cross, the chefnut, black chefnut, and sometimes white foxes. The most valuable foxes are the most cunning, as the blue-breasted, the black chefnut,

and the fiery coloured; so that the Kamtschadales, and even the Russians, find great difficulty in catching them. The fables of this country excel those found in any other place, both in largeness, thickness of hair, and brightness. Their furs are sold at a great price in China, and few of them are brought into Russia. The inhabitants esteem the flesh very delicious eating. These animals are in greater plenty here than in any other country in the known world.

As the large species of marmottas abound every where in Kamtschatka, their skins are used by the Koreki for cloaths, and esteemed no disagreeable dress, they being both light and warm, and at a distance their back resemble the spotted feathers of birds. When these animals eat, they sit upon their hind legs like squirrels, and hold their food, which is cedar-nuts, berries, and roots, with their fore-feet. They are pretty to look at, and make a loud whistling noise.

People do not think it worth their while to hunt ermines, common marmottas, or weazels, except they meet with them by chance; but there is an animal of the weazle kind, called the glutton, which has a fine fur, so highly esteemed, that when they describe a man richly dressed, they say he is clothed with the fur of the glutton. The women place the white paws of this animal in their hair, and esteem them very ornamental. These creatures are surprisingly dexterous in killing of deer; they climb up a tree, carrying with them some of the moss the deer are used to eat. This they drop from the tree; and if the deer stops to eat it, they throw themselves down upon his back, and fastening between the horns, tear out his eyes, and put him to such pain, that he strikes his head against the trees, either to ease himself or destroy his enemy, till he falls to the ground. No sooner is he brought down than the glutton takes off his flesh from the bones, and hides it in the earth, to prevent its being seized by any other animal. They destroy horses in the same manner; yet are easily tamed, and taught to play several tricks. They are said to eat to such excess, as to be obliged to relieve themselves by squeezing their bodies between two trees, in order to unburthen their bellies of this unsufferable load; but those who are tamed are not so voracious.

Bears and wolves are so exceeding numerous, that they fill the fields and woods like cattle; the bears during the summer, and the wolves during the winter. The bears are neither large nor fierce, and never attack any man, except they find him asleep, and then they seldom kill him; but usually tear the scalp from the back part of the head: but when fiercer than ordinary, they will tear off some of the fleshy parts, but not eat them. It is remarkable, that these bears will not hurt women, but go about with them like tame animals, especially when they gather berries. Indeed they sometimes eat the berries the women have gathered, which is the only injury they receive from them.

In the season, when the fish come in vast shoals into the rivers, the bears come down from the mountains and settle in places proper for catching them; when they take such quantities, that they only eat the heads, neglecting the bodies; and when the fish have retired back to the sea, they are glad to eat what they formerly despised. It is not unusual for them to steal fish from the fishing-huts of the Cossacks, though a woman is always left to watch them; but they never hurt her.

The Kamtschadales esteem the flesh and fat of the bears their most delicious food; of their skins they make their beds and coverings, caps, gloves, and dogs collars. Sometimes they fasten them to the soles of their feet, to prevent their sliding on the ice, and with their shoulder-blade-bones made sharp they cut grafs. In summer they use the guts to cover their faces to keep off the sun.

The wolves resemble those in other places, and their furs are much esteemed for cloaths; but by their cunning and fierceness they do the inhabitants more injury than their furs are worth; for they not only kill the wild deer, but herds of the tame, though they are always guarded.

The deer and stone-rams are the most useful of all the animals in this country, their skins being most used in cloathing. The deer live in mossy places; and the wild rams upon the most lofty mountains: these resemble goats, but their hair is like that of the deer. The horns of those that are of full age weigh each from twenty-five to thirty pounds:

pounds: they run with great swiftness, throwing their twisted horns back upon their shoulders, springing over the rocks, and skipping along the narrow ridges of the precipices. The fat upon their haunches equals that of the deer, and the flesh is most delicious food. Cloaths made of their skins are very warm. Of the horns are made spoons, ladles, and other utensils; and when the Kamtschadales travel, they stick an entire horn in their girdles, which serves for a bottle.

The dogs of this country resemble the village dogs of Europe, and are white, black, spotted, or grey, like the wolves; but brown or other colours are very rare: these dogs are esteemed swifter and longer-lived than those of other countries, which may be attributed to their food. In the spring they run at liberty, feeding upon what they get in the fields, where they scratch up the ground for mice, and catch fish in the rivers. The Kamtschadales call them home in October, and they are tied up till they lose much of their fat, in order that they may be lighter for the road; when nothing is to be heard night nor day but their howling. In the winter they are fed with fish-bones and opana, which is thus prepared: they pour water into a large trough, into which they throw some ladlefuls of rotten fish, prepared in pits for that purpose, adding some fish-bones, and heating the whole with red-hot stones till the fish and bones are boiled. They are fed only at night, which makes them sleep well; but they never give them any in the day when they are to travel, because it would render them heavy and lazy; though if they are ever so hungry, they will not eat bread.

Dogs are absolutely necessary in Kamtschatka for drawing the sledges over the snow; for had they plenty of horses, they could seldom be used in winter, on account of the great depth of the snow and the number of hills and rivers. Besides, in the greatest storm, when a man cannot see the path, or even keep his eyes open, they seldom miss their way; and if they should, they soon find it again by their smell.

Those bred to hunt the deer, fables, foxes, and wild rams, are sometimes fed with jackdaws, which are thought to make their scent the stronger in smelling out birds and wild beasts. Their skins are also used for cloaths, particularly those of the white dogs, with which all their garments are trimmed.

There are three sorts of rats, those in the huts, where they run about without fear, and live upon offals; another sort live in the fields, and, like the drones among the bees, steal their food from the third kind, which also live in the fields, woods, and high mountains, in a kind of community, having very neat nests, which are large, and divided into different apartments spread with grass; in some of which they store up roots of several kinds, which they gather with great labour in summer, and lay up against winter; dragging them out in dry sun-shiny weather, in order to dry them. All the summer they live upon berries and such other food as they can find, never touching their winter-provisions while any is to be procured in the fields.

These change their habitations, and sometimes they all leave Kamtschatka, which the Kamtschadales imagine forebodes a rainy season, and a bad year for hunting; but when they return, they expect a fine one, and a good year for the chase, and therefore expresses are sent to all parts with the good news.

They always depart in the spring; first assembling in great numbers. They steer their course due west, crossing rivers, lakes, and even arms of the sea; and when they reach the shore, spent with fatigue, they lie as if dead upon the banks, till recovering their strength, they again pursue their march. They have nothing to fear on the land; their greatest danger is, lest some ravenous fish should devour them. The Kamtschadales, on finding them weak on the banks, give them any assistance in their power. From the river Penguin they march southward, and about the middle of July usually reach Ochotska and Judoma. Their troop is sometimes so numerous, that travellers are obliged to wait two hours for their passing by. They usually return to Kamtschatka about the month of October. It is extremely surprising that such small animals are able to pass over such an immense tract of land; and nothing

can be more admirable than the order and regularity they observe in their march.

The amphibious animals of Kamtschatka are of many different kinds. The manati, or sea-cow, never comes upon the shore, but lives constantly in the water. Though this animal has the name of sea-cow, it resembles the cow only in its snout, and has neither horns, straight ears, nor hoofs. It is an animal like a seal, only it is incomparably larger; it being about twenty-eight feet long, and some of them weigh eight thousand pounds. Its skin is black and thick like the bark of an aged oak, and so tough and hard, that it can scarcely be cut with an ax. Its head is small in proportion to its body, and falls off from the neck to the snout, which is white and rough, with white whiskers about nine inches long. Instead of teeth, it has two flat white bones, one above, the other below. Its nostrils, which are near the end of the snout, are within rough and hairy. Its eyes, which are placed nearly in a line with the nostrils, are black, and no larger than those of a sheep, which is remarkable in a creature of so monstrous a size. It has neither eye-brows nor eye-lashes, and its ears are only small openings; its neck can scarcely be discovered, the head and body being so closely joined: but there are some vertebræ which enable it to turn its head, and to hang it down in feeding like a cow. The body is round like that of a seal, and the female has two teats on her breast. The tail is thick and a little bent towards the end, and has some resemblance to the fins of a fish. It has two fins under its neck, about twenty-one inches long; these it uses like hands, with which it swims, and takes hold of the rocks with such force, that, on its being dragged from thence with hooks, it will leave the skin behind: these fins are sometimes divided in two, but this seems to be only accidental.

These animals in calm weather swim in droves near the mouths of the rivers; and though the dams oblige their young to swim before them, they are covered on all sides by the rest of the herd, and constantly swim in the middle. They live in families, consisting of a male, a female (some half grown, and one small calf. They bring forth in harvest, and never have above one at a time.

They are almost continually eating; and, as they seldom lift their heads above the water, any one may go among them in boats, and carry off what he pleases: they feed upon several sorts of sea-weed, and have their backs and sides above water, upon which flocks of crows settle to pick off the vermin they find there.

They are caught with great iron hooks, somewhat resembling the fluke of a small anchor. These are carried by a man in a boat, with three or four rowers; who, on his coming among the herd, strikes the hook into one of them; then about thirty men upon the shore, who hold one end of the rope that is fastened to the hook, draw the manati towards the land; while those in the boat stab and cut the animal till it dies. When one of them struggles to clear himself of the hook, those of the herd that are nearest come to his assistance; some frequently overset the boat by getting under it; and others strive to remove the hook by striking it with their tails, which sometimes succeeds. The male and female have such an affection for each other, that when one of them has in vain used every method in its power to give assistance, it follows the body, after it is killed, to the very shore; and has sometimes been observed to remain by it two or three days.

Their flesh, when thoroughly boiled, has a good taste, and resembles that of beef; the fat of the young eats like that of pork, and the lean like veal.

The number of seals in the seas and lakes of Kamtschatka is so great, that all the islands and sand-banks are covered with them. There are reckoned four sorts of this animal, the largest of which is caught from the fifty-sixth to the sixty-fourth degree of north latitude, and differs from the others only in its bulk, which exceeds that of a large ox. The second species, which is of the size of a yearling bullock, has a skin somewhat like that of a tyger; it having spots of an equal size on the back, with a white and yellowish belly; but the young are as white as snow. The third sort is less than the former, and has a yellowish skin, with large cherry-coloured circles. The fourth is of a whitish colour. No animal has a more disagreeable cry than that of

of the seals, and their noise is incessant. When the tide goes out, they lie upon dry rocks, and in play push one another into the water; but they no sooner begin to be angry, than they wound each other with their teeth.

There are different ways of killing them: on shore, they surprise them asleep, and dispatch them with clubs: in the rivers they shoot them with guns, taking care to hit the head; for a hundred bullets in any other part would have no effect, as they all lodge in the fat with which the body is covered. When they find them asleep with their snout upon the ice, they drive a knife through it, fastened to a long thong, by which they drag out the animal.

Of the skins of the larger sort they make soles for their shoes, and by joining several of them together, make boats of different sizes, some of which are so large as to carry thirty men: these are lighter and swifter than those made of wood. The natives esteem the fat such a delicacy, that they have it at every feast: it also serves for making candles. They dry the flesh in the sun, or boil it when fresh; but when they have great quantities, they bake and smoke it: for this purpose they dig a large pit, and pave the bottom with stones; then filling it with wood, light it below, and continue to add fuel till it is as hot as an oven. Afterwards taking out all the ashes, and laying a layer of green poplar wood at the bottom, they put another of seal's flesh or fat, each separately, and thus alternately wood and flesh till the pit be filled: then they cover it with grass and earth to keep in the heat; and some hours after taking out the fat and flesh, they lay it up for the winter. It is said, that when the flesh and fat is thus prepared, it tastes much better than when boiled, and will keep a whole year without spoiling.

Sea-horses only appear in the most northerly parts of Kamtschatka; their teeth are what is called fish-bone, and their price depends on their size and weight: the dearest weigh about twenty pounds each; but they are seldom so large, and commonly weigh about five or six pounds.

In spring and in September are caught the sea-cats, which are thus called at Kamtschatka, from long hairs standing out on both sides of the mouth like those of cats. Dampier, who saw them in the South Sea, has described them under the name of sea-bears. The largest weigh about eight thousand weight. Most of the females taken in spring are pregnant; and those that are near the time of bringing forth their young, are immediately opened, and the young ones skinned. They breed on the neighbouring coast of America, where they nurse their young three months, and then return with them at the end of the summer. The females give suck with two teats placed between their hinder-legs; but they have seldom more than one at a time. The young see when they are whelped. Their eyes are as large as those of an ox, and they have thirty-two teeth, besides two tusks on each side, which begin to appear the fourth day after their birth. At first their colour is a dark blue, but in four or five days grey hairs begin to appear, and in a month's time their belly is black and grey. The male is larger and blacker than the female, which turns almost blue as she grows up, and has only grey spots between her four legs.

The male and female are so different in their form and strength, that they seem different animals: and besides, the former are fierce, and the latter mild and fearful. The male has from eight to fifty females, of whom he is so jealous, that he will not allow any other to come near them: and though many thousands lie on the shore, every family lives apart, the male with his females, young ones, and those of a year old that have not yet attached themselves to any male; so that the family sometimes consists of one hundred and twenty. Those that are old, or have no mistress, live by themselves, and some lie asleep a whole month without nourishment: these are fiercer than any of the rest. They attack all that pass by, and will rather die than retire. On seeing a man approach them, some rush upon him, and others lie ready to support them. They bite the stones that are thrown at them, and rush with redoubled violence on him that throws them. Even if you strike out their teeth with stones, or put out their eyes, they will not fly; and indeed they dare not, for every step they meet a new enemy; so that if the sea-cat could save himself from man, his own brethren would destroy him;

for if any one seems to be driven back ever so little, others approach to prevent his running; and if he appears to design it, fall upon him. Sometimes they are seen fighting for a mile together, and then one may pass them without the least danger. If two fall upon one, others advance to support the weakest; for they will not allow of an unequal combat. While these battles continue, those that are swimming in the sea raise their heads and look at the combatants, and at length come and increase the number.

When only two of them fight, the battle frequently lasts an hour; sometimes they rest, lying by each other, then both rise at once and renew the engagement. When fighting they hold up their heads, and turn them aside, to escape a blow; for while their strength is equal, they fight only with their fore-paws; but one of them no sooner becomes weak, than the other seizes him with his teeth, throws him on the ground. The lookers on then come to the assistance of the vanquished.

Their most bloody battles are on account of their females, when one endeavours to carry off the mistress of another, or his young females. They also quarrel when one comes too near the place of another.

Though the male is fond of his young, both they and the large females fear him extremely. If a man endeavours to take a young one, the male defends it, and allows the female to escape with the young one; but if she drops it out of her mouth, the male leaves his enemy, and seizing upon her with his teeth, beats her against the stones till she lies down as if dead; but she no sooner recovers, than crawling to his feet, she licks and washes them with her tears that flow in abundance; while the male stalking about, gnashes his teeth, and tosses his head like a bear.

They swim exceeding fast, and when they happen to be wounded at sea, seize the boats of the fishers with their teeth, and drag them along so swiftly, that they seem to fly and not to swim upon the water. The boat is by this means frequently overset, and the people drowned.

The sea-beavers resemble the others only in their downy hair; they are as large as the sea-cats; their head resembles that of the bear, and their shape the seal: their teeth are small; their fore-feet are longer than those behind; their tail is flat, short, and sharp towards the point; and their hair thick and black: but that of the old ones turns grey. This animal is so peaceable, that it never makes any resistance, and only endeavours to escape by flight. The females are fond of their young, and carry those that cannot swim upon their belly, holding them with their fore-feet, and swimming on their back. When pursued by the fishermen, they never quit their young till the last extremity; and should they happen to slip out of their paws, they instantly return to take them up again; therefore the fishers endeavour to kill or catch the young, as the most effectual method of taking their dams.

There are a great number of birds at Kamtschatka, but the natives are not skilled in catching them. Sea-fowl appear in great plenty about the coast of the Eastern Ocean. Among these are the puffins, which are somewhat smaller than a tame duck: the head and neck are of a blueish black, the back is also black, the belly and all below white; its bill and legs are red, and its feet webbed. Another species of them is all black, but has two yellowish white tufts, which lie upon its head like locks of hair.

The cormorants here are of two kinds, and about the size of a goose; they have a straight reddish bill, about five inches long, and four nostrils. Their eyes are black, their legs are covered with hair to the knees, and their toes are of a blueish colour, and are webbed; their tails are eight inches long, and their wings extend above a fathom. They are sometimes speckled. They fly slow when hungry; but when full, cannot rise from the ground: and having eat too much, they ease their stomachs by throwing is up.

The natives have a singular way of catching them: they fasten a hook to a long cord, baiting it with a whole fish, and then throw it into the sea: the cormorants gathering about it in flocks quarrel for the prize, till it is swallowed by the strongest, which is then drawn ashore.

There are other cormorants that frequent the rivers, and have a forked tail like that of a swallow.

The

The glupisha are of the size of the river-cormorants, and are found on high steep places upon the rocky islands. Their colours are grey, white, and black. They are perhaps called glupisha, or foolish, from their frequently flying into the boats. Their bills are crooked and yellowish; their eyes are as large as those of an owl; and they are often spotted with white.

There are great plenty in Kamtschatka of a fowl called urile, and by some writers the sea-raven. It is of the size of a common goose, with a long neck and small head: the feathers on the body are black, but those of the thighs are white, and long white feathers like hairs are scattered on its neck. It has a red membrane round the eyes, a straight bill, black above and reddish below, and its feet are black and webbed. It feeds upon fish, which it swallows whole; and in the night-time these fowls stand in rows upon the edges of the cliffs, from which they frequently fall in their sleep into the water.

Swans are very common here both in summer and winter; the natives hunt them with dogs when they are moulting, and kill them with clubs.

There are several kinds of geese which come to Kamtschatka in May, and depart in October. There are likewise many kinds of ducks.

In this country are also many widgeons, partridges, snipes, larks, cuckows, swallows, ravens, magpies, crows, hawks, and eagles.

As to the fishes, whales frequently come close to the very shore, perhaps to rub off the shell-fish which adhere to their bodies, and are very troublesome to them. These whales are from seven to fifteen fathoms in length. The Kamtschadales obtain many advantages from the whales: they make shoe-soles and straps of the skin; they eat the flesh and fat, and the last they also burn; they make nets of the beard, and also sew their boats with it; they form a kind of sledge out of the lower jaw, and likewise make of it knife-handles and rings. Of the intestines they make vessels, of the nerves they make ropes, and of the vertebræ feets. The most delicate pieces of the whale are the tongue and the fins.

There are also a large kind of salmon, cod, skate, red fish, the humpback turbot, herring, lampreys, and many other sorts, which come from the sea in such numbers, that they frequently stop the course of the rivers, and cause them to overflow their banks; and when the waters retire, a surprising quantity of dead fish remain on the shore, which cause an intolerable stench.

SECT. IV.

Of the Natives of Kamtschatka. Their Persons, Dress, Huts, Manners, and Customs; particularly their Marriages, the Birth of their Children, their Diseases, and Treatment of the Dead. Their Entertainments, and their Manner of travelling in Sledges drawn by Dogs.

THE natives are divided into three different people, the Kamtschadales, who live upon the south side of the peninsula of Kamtschatka; the Koreki, who inhabit the northern parts on the coast of the Penschinska Sea, and along the shore of the Eastern Ocean, almost to the river Anadir; and the Kuriles, who inhabit the second Kurilskoy island, and the other islands that extend southward to those of Japan. The Koreki are again divided into two nations, one called the fixed Koreki, and the other the Rein-deer Koreki; the former living near the rivers like the Kamtschadales, and the other wandering with their herds. Their languages are different, and they cannot understand each other. The inhabitants of Kamtschatka have three languages, that of the Kamtschadales, the Koreki, and the Kuriles, each of which has different dialects.

The Kamtschadales, like the Mongol Tartars, are of a small stature and swarthy: they have black hair, a broad face, a sharp nose, with hollow eyes, and small and thin eyebrows, and their arms and legs are slender. Though in their appearance they resemble the other inhabitants of Siberia; yet the faces of the Kamtschadales are shorter than those of the other Siberians, their cheeks are more swelling, their mouths are large, and their shoulders broad, particularly those who inhabit the sea coast.

Their cloaths are generally made of the skins of deer, dogs, and several other land and sea animals, and even of the skins of birds; and it is not unusual with them to use those of different animals in the same garment. They commonly wear two coats, the under coat with the hairy side inwards, and the upper with the hair outwards: for these last they choose black, white, or speckled skins. The skirts of some are of an equal length, and those of others are long behind and in the form of a train. The sleeves of the upper coat are very long, so as to hang below the knee; and it has a hood, which, in bad weather, they put over their heads. They border their coat with white dog skin, and upon their backs sew small shreds of different coloured skins or silk.

These garments are worn both by men and women; but the latter commonly wear at home in the house a waistcoat and drawers sewed together. The household habit of the men is a leather girdle, with a bag before and a leathern girdle behind. Their feet and legs are covered with different sorts of skins. During the rains of summer they wear seal-skins, with the hair outwards, but they are generally covered with the skin of the legs of rein-deer. They wear caps, and in summer a kind of hats of birch-bark tied about their heads; and the Kuriles have caps of plaited grass: however, round the Russian settlements the antient dress is laid aside, and the women wear shifts, ruffles, caps, waistcoats, and ribbons. They even do all their work in mittens; and though they formerly never washed their faces, they now use white and red paint.

But still the distant inhabitants never wash their hands and face, nor cut their nails. They eat out of the same dish as the dogs, and yet never wash it; and every thing about them stinks of fish. They never comb their heads, but both men and women plait their hair in two locks, binding the ends with small cords; and when any hair starts out, they fasten it close with thread: by this means they are so excessive lousy, that they can scrape off the vermin, which they are so nasty as to eat.

Their manners are extremely unpolished, for they never use any civil salutation, never take off their caps, nor bow to each other, and their discourse betrays the most stupid ignorance; yet upon many occasions they appear curious and inquisitive.

They live under ground, where they build their huts in the following manner: having dug a hole about five feet deep, and of a breadth and length in proportion to the number of persons designed to live in it, they fix at the corners four pieces of timber, upon which they place beams, and upon them form their roof or ceiling, only leaving in the middle an opening, which serves both for a window and chimney. This building they cover with grass and earth, so that it resembles a round hillock. The room below is an oblong square, and the fire-place is in one of the long sides. Round these huts they make benches, on which each family lies separately; but there are no benches on the side opposite to the fire, for there they place their kitchen furniture, and dress victuals for themselves and dogs. In some huts instead of benches the place is floored with wood, and covered with mats; the walls are also adorned with mats. These huts are entered by ladders, which are commonly placed near the hearth; so that when there is a good fire, the ladder becomes so hot, and the smoke so thick, that any one not inured to it would be suffocated; but they find no difficulty in going in and out: and though they only fix their toes on the steps of the ladder, they mount like squirrels.

The Kamtschadales live all the winter in these huts, and in summer have others, which serve them also for warehouses. These are thus made: nine pillars, about four yards long, or more, are fixed in the ground, and bound together with beams laid over them: upon these they form a floor, and from thence raise a sharp roof, rising from each side up to a point in the middle, and thatched with grass. On each side there is a door opposite to each other.

These summer huts thus placed high above the ground, are more convenient in summer than those formed beneath it, on account of the frequent rains, which would spoil all their fish, were it not preserved in such places; and if they were not so high, the wild beasts would plunder them; for, notwithstanding all their care, the bears sometimes climb up, and force their way into these store-houses, especially

especially in the time of harvest, when the fish and berries grow scarce. These are built round their winter habitations.

The southern Kamtschadales generally build their villages in thick woods, at a considerable distance from the sea, and their summer habitations near the mouths of the rivers; but those who dwell on the banks of the Eastern Ocean and the Penschinska sea build their villages near the shore. Their household furniture consists in dishes, troughs, bowls, and cans.

When a Kamtschadale intends to marry, he seeks for a bride in some of the neighbouring villages, seldom in his own; and when he has found one to his mind, he immediately signifies his intention to the parents; at the same time desiring, that he may have the liberty of serving them for some time. After this time is expired, he desires that he may have liberty to seize his bride; which, if he has pleased the parents, is immediately granted: but if he has not, he is dismissed with a present for his services.

As the whole ceremony of marriage consists in his stripping the young woman naked, they strive to render this as difficult as possible; she has two or three different coats, and is swathed round with fish-nets and straps; and all the women of the village are obliged to protect her. The man therefore watches for an opportunity of finding her alone, or with but few women in her company; and as soon as he has found it, rushes upon her, and begins to pull off her straps, nets and cloaths. But he does not always find this an easy task; for though the young woman makes but a faint resistance, the women that are generally in her company fall upon him without mercy, beating him, dragging him by the hair, scratching his face, and using every other method they can devise in order to prevent his accomplishing his design.

If he succeeds in his attempt, he immediately runs from her; and the bride, as a proof of her being conquered, calls him back with a soft and feeble voice; and thus the marriage is concluded. The same night he goes to bed to her, and the next day carries her home. Some time after the bride and bridegroom return to the bride's relations, where the marriage feast is celebrated.

This ceremony only relates to the marriage of a virgin, for with a widow the agreement of the parties is sufficient; but the man must not take her to himself before her sins are done away. This can only be accomplished by a stranger's once lying with her; but as this taking off of sin is considered by the Kamtschadales as extremely dishonourable for the man, it was formerly difficult to procure one to undertake it; but since the Cossacks came among them, the poor widows are in no distress for strangers to take away their sins.

Marriage is only prohibited between father and daughter, mother and son: A Kamtschadale has frequently three wives; but with every maid he is obliged to undergo the above ceremony. The women are far from being jealous, for the wives live together in perfect harmony.

When the women go abroad they veil their faces; and if they meet a man, and cannot get out of the way, turn their backs to him till he has passed by.

They have commonly very easy labours: they are delivered upon their knees in the presence of all the people of the village, without distinction of age or sex. The child is wiped with tow, and the navel-string tied with thread made of nettles, and then cut with a knife of flint. The infant, instead of being swathed in cloaths, is wrapt in tow. The mother, or nearest relation, generally performs the office of midwife.

Some women, to promote conception, eat the navel-string of the child; and others, for the same purpose, eat spiders: some, on the contrary, endeavour by medicines to procure abortion; but though this is a capital crime, yet when a woman bears twins, they are obliged to destroy one of them, as also a child born in stormy weather; though the last may be averted by certain incantations. How amazing is it that the barbarous custom of people's destroying their own offspring should be publicly allowed in many nations! How astonishing is it that parental affection ever suffered such cruel customs to take place!

The Kamtschadales imagine that the diseases with which they are afflicted are brought upon them by the spirits that

inhabit particular groves, for their presuming to cut any of them down. Their principal disorders are the scurvy, jaundice, the venereal disease, boils, palsy, and cancer, which they endeavour to cure by charms and incantations; but yet they do not neglect the use of herbs and roots. The boils are esteemed the most dangerous, and cause the death of numbers. These are often two, and sometimes three inches over, and on their breaking, they open in forty or fifty little holes. It is esteemed very dangerous when no matter proceeds from these openings. They use raw hare skins to bring on a suppuration, and those that recover are sometimes confined, six and sometimes ten weeks to their bed. The palsy, cancer, and venereal disease, are thought incurable; and they say the last was never heard of before the arrival of the Russians. They have also another disease, called the fushutch, which is a kind of scab that encompasses the body under the ribs like a girdle; when this does not suppurate and fall off, it is mortal; and they assert that every one has it once in his life.

Instead of burying the dead, the Kamtschadales drag the corpse out of the hut with a strap fastened round the neck, and then deliver it for food to their dogs. For this custom, so shocking to humanity, and so contrary to the practice of all other nations, they give the following reasons: that those who are devoured by dogs will be drawn in sledges by fine dogs in the other world; and that the corpse is thus used near the hut, that the evil spirits, who are the occasion of the person's death, may be satisfied with the mischief they have done. However, it is not unusual when one has died in the hut to remove to another place, and only leave the corpse behind.

All the cloaths of the deceased are thrown away, not from their imagining that they shall have them in the other world, but from the opinion that whoever wears them will come to an untimely end. This superstition particularly prevails among the Kuriles of the Lopatka, who would not touch any thing that belonged to the dead, though they had ever so great an inclination for it.

After the body has been thus devoured, they use the following purification: they go to a wood and cut some rods, with which they make a ring, and creeping through it twice, carry it back to the wood, and throw it towards the west. Besides, those who dragged out the body must catch two birds, one of which they eat with the whole family, and the other they burn. Before this purification they dare not enter any other hut, nor will any body else enter theirs: it is therefore performed immediately, and in commemoration of the dead the whole family dine upon a fish, and burn the fins in the fire.

When a Kamtschadale seeks the friendship of another, he invites him to his hut, which is made very hot for his reception; and he no sooner enters, than they both strip themselves naked. The master of the hut then sets before his guest great plenty of his best provisions; and, while he is eating, throws water upon red-hot stones, till the heat of the place becomes insupportable. The stranger strives to bear it, and to eat up all the victuals, while the master of the hut endeavours to oblige him to complain of the heat, and to desist from eating. He himself eats nothing, but is allowed even to leave the hut, though the visitor is not suffered to stir till he confesses that he is overcome. They usually eat so much at these feasts, that for two or three days they can scarcely move, or bear the sight of victuals. At length the visitor being unable to eat any more, purchases his dismissal with presents of cloaths, dogs, or whatever the master of the hut likes; and, in return, receives others of no value. But if the man who has obtained this advantage over his friend does not soon return the visit, the guest pays him another, and then it is his turn to make him such presents as he is able; and if he makes him none, it is considered as the greatest affront, the man himself will be his enemy, and nobody else will live in friendship with him.

Sometimes one village entertains another, either upon account of a wedding, or their having had great success in hunting or fishing. The master of the hut endeavours to make his guests sick with eating, and sometimes gives them a liquor made of a large mushroom, prepared with the juice of epilobium or French willow, which intoxicates them in so strange a manner, that they commit a thousand
extravagan-

extravagancies; and if the dose be too large, it sometimes proves fatal; and those who are thus intoxicated die raving mad.

The women never use it, for all their mirth consists in jesting and singing; instead of dancing they spread a mat in the middle of the room, and kneel upon it opposite to each other, holding a little tow in each hand. At first they begin to sing very low, giving a gentle motion to their hands, but by degrees raise their voice and increase their motion till they are fatigued and out of breath. With this uncouth entertainment the Kamtschadales appear highly delighted.

The women, who have generally clear and agreeable voices, compose their love songs, in which they declare their affection to their lovers, their grief, their fondness, and other passions; but though they have an inclination to music, they have no musical instrument except a flute, upon which they play very poorly.

A stranger no sooner comes to Kamtschatka than they give him a new name, and at their entertainments mimic all his actions. They have also professed buffoons, but their wit is intolerably indecent and obscene. They sometimes smoke and tell stories with their friends.

They travel in sledges drawn by four dogs, driving them with a crooked stick four feet long, or a whip of different coloured thongs. They sit upon the right side of the sledge, with their feet hanging down; and it would be thought a disgrace for any one to sit in it, or to have a person to drive them, nobody doing this but the women. A man is obliged to keep an exact ballance to prevent his being overturned, which would be very dangerous, as the dogs never stop till they come to a house, and in going down steep hills run with all their force: therefore, in descending great declivities, they unyoke all the dogs except one, and lead them gently down. They also walk up every steep ascent; for it is as much as the dogs can do to drag up the empty sledge. Upon a tolerable road they can travel with the sledge, filled with provisions and the driver, about thirty versts a day; and in spring, when the snow is hard, and splinters of bone are fixed to the sledge, they can travel without any load one hundred and fifty versts.

There is no travelling with dogs after a deep snow, till a path be made, which is performed by a man going before with snow shoes. These are made of two thin boards separated in the middle, and bound together with thongs; the fore part is bent up a little, and a place made to slip in the foot, to which the shoe is tied with thongs.

If a company of travellers is surprized by a storm, they dig a place of shelter under the snow, and cover the entrance with wood or brambles. They however seldom make these temporary huts, but more commonly hide themselves in caves or holes of the earth, wrapping themselves in their furs; and when thus covered they move with great caution, lest they should throw off the snow, which keeps them perfectly warm; they must only have the convenience of a breathing-place: but if their cloaths are hard girt about them, the cold is insufferable.

SECT. V.

Of the Arts practised among the Kamtschadales.

THE men, besides hunting and fishing, all understand the art of weaving nets, making sledges and boats, building their huts, dressing their provisions, and forming their furniture and warlike instruments.

The women, on the contrary, are the only curriers, dyers, tailors, and shoemakers, for they dress and dye the skins; make all the coats, shoes, and stockings, and are also employed in curing the sick.

The skins of the beavers, deer, dogs, and seals used for cloathing are all thus prepared: taking one of these, they first wet and spread it out, and with stones fixed in wood scrape off all the pieces of fat or veins that remained after flaying; then rubbing it over with caviar, roll it up and tread it till it begins to stick: afterwards scraping it again, they proceed as before till the skin is soft and clean. Those they want to prepare without the hair, they first use in the same manner, then hang them in the smoke for a week,

and afterwards, to fetch off the hair, soak them in water. At last they rub them with caviar, and by frequent treading, and scraping them with stones, render them soft and clean.

The deer and dog-skins used for cloathing are dyed with alder-bark cut and rubbed very small: but the seal-skins used either for cloathing, shoes, or straps for binding their sledges, they dye in a particular manner. Having first cleaned off the hair, they make a bag of the skin, and turning the hair-side outwards, pour into it a strong decoction of alder-bark. They let it lie some time, then hang it upon a tree, and beat it with a stick. This they repeat till the colour has penetrated through the skin. Then picking out the stitches, they stretch it out, dry it in the air, and at last rub it till it becomes soft for use.

They make glue of the dried skins of fishes, and particularly of that of the whale.

Before they were conquered by the Russians, the men made use of stones and bones instead of metals, and of them made hatches, spears, arrows, needles, and lances. Their hatches were sometimes made of flint, and sometimes of the bones of whales or rein-deer: they were in the form of a wedge, and fastened to crooked handles. With these they hollowed out their canoes, troughs, and bowls: but the work was so tedious, that a man would be three years in making a canoe. Hence their wooden bowls, which they were long in making, were more valued by them than vessels of the most precious metals and most curious workmanship are with us. In these bowls they dress their victuals, and heat their broth, by throwing red-hot stones into them.

They made their knives of a greenish mountain crystal, sharp-pointed, shaped like a lancet, and stuck into a wooden handle. Of the same crystals they likewise made their lancets, with which they still continue to let blood. With this crystal they also pointed their arrows and spears. They used to sew their cloaths with thread made of the fibres of deer, which they split till they brought it to the thickness required. Their needles they made of the bones of fables, and with them the women not only sewed their cloaths, but also made curious embroidery.

In order to kindle a fire, they use a board of dry wood, in which are several round holes, and putting the end of a small round stick into one of these, they roll it backwards and forwards with the palms of both hands, till the friction causes the wood to take fire; and instead of tinder they use dry grass beat soft. These instruments are so highly valued by the Kamtschadales, that they are never without them; for they prefer them to steel and flints: they are, however, excessive fond of iron hatches, knives, and needles. At the first arrival of the Russians they considered a piece of iron as a valuable present, and even yet receive it with thankfulness; for they know how to make use of the least bit, either in pointing their arrows, or their darts, which they perform by hammering it out cold between two stones.

Indeed, all the savage inhabitants of these parts are particularly fond of iron; but as some of them delight in war, the Russian traders are forbid to sell them any warlike instruments; yet they are so ingenious as to make spears and arrows out of the iron pots and kettles that are sold to them; and are so dexterous, that when the eye of a needle is broke, they make a new one, which they repeat till nothing remains but the point.

SECT. IV.

Of the Religion and Laws of the Kamtschadales.

THE Kamtschadales have very mean and absurd ideas of the Deity, to whom they pay no religious worship; they call him Kutchu, and frequently reproach him for having made so many steep hills and rapid rivers, for sending so many storms and so much rain. They erect a kind of pillar in a spacious plain, and bind it round with rags. Whenever they pass by it they throw to it a piece of fish or some other victuals, and near it never gather any berries, or kill either birds or beasts; but they offer nothing that is

is of use, or which they would not otherwise be obliged to throw away. Burning mountains, hot springs, and particular woods they esteem sacred, and imagine them inhabited by evil spirits, whom they fear and reverence more than their god; for they have filled almost every place with different spirits, to whom they make offerings upon every occasion; and some carry little idols about them, or have them placed in their dwellings. They have no notion that the Supreme Being can dispense happiness or misery, but maintain that every man's good or bad fortune depends upon himself. They believe that the world is eternal, and the soul immortal; that it shall be again united to a body, and live for ever subject to the same troubles and fatigues as in the present life, only that they shall enjoy a greater plenty of all necessary accommodations. They even imagine that the smallest animals will rise again and dwell under the earth; for they believe the earth is flat, and under it another sky and another earth like ours, where, when we have summer, they have winter.

Their religious sentiments are so extravagant, that they pay a kind of solemn regard to several animals from which they apprehend danger. They offer fire at the holes of the foxes and fables; when hunting they beseech the wolves and bears not to hurt them; and in fishing intreat the whales and sea-horses not to overset their boats.

Being chiefly employed about providing what is absolutely necessary for the present, they take no care for the future. They have no notion of riches, fame, or honour; therefore covetousness, ambition, and pride are unknown among them: but, on the other hand, they are careless, lustful, and cruel. These vices frequently occasion quarrels and wars among them, not from the desire of increasing their power, but to carry off their provisions, and more frequently their girls; which is sometimes practised as the shortest method of procuring a wife. They believe every thing lawful that can procure the gratification of their passions; so that they neither esteem murder, self-murder, adultery, oppression, or the like, any crime: but, on the contrary, think it a mortal sin to save any one that is drowning, because they are persuaded that whoever saves him will soon be drowned himself. They also reckon it a sin to bathe in or to drink hot water, or to ascend the burning mountains.

It is a law with them, that if one man kills another, he is to be killed by the relations of the person slain. The thief for the first offence must restore what is stolen, and live without expecting any assistance from others; but they burn the hands of those who are frequently caught thieving. To punish an undiscovered thief, they, with great ceremony, burn the sinews of the stone-buck, imagining that as these are shrunk by the fire, the thief will have his limbs contracted. They never have any dispute about their lands, for each has more than he wants.

Though they are involved in ignorance, and might be thought, from their manner of life, extremely wretched; yet they think themselves the happiest people upon earth, and look upon the Russians who live among them with contempt. This opinion, however, loses ground; for as the old people, who are fond of their ancient customs, drop off, and the young ones frequently embrace the Christian religion, they insensibly adopt the Russian customs, and begin to despise the superstition and barbarity of their ancestors.

By the care of the late empress Elizabeth, missionaries were appointed to instruct them in the Christian religion; and since the year 1741 many of them have been baptized, and schools erected in several places, to which the Kamtschadales very readily send their children.

S E C T. VII.

Of their home Trade and Method of bartering, their Ignorance of Numbers, Division of the Year, and little Skill in any of the Sciences.

THEIR trade only tends to procure the necessaries and conveniences of life, by exchanging what they abound with for what they want. This kind of barter is carried on among themselves under a great show of friend-

ship, for if one wants any thing another has, he goes freely to visit him, and without any ceremony tells him what he wants, though he never had an acquaintance with him; and the other is obliged, according to the custom of the country, to give him whatever he has occasion for; but he afterwards returns the visit, and telling what he desires, is also immediately supplied.

They keep no account of their age, though they can reckon as far as an hundred, but they count every thing with their fingers, and it is diverting to see them reckon above ten; for having counted the fingers of both hands they clasp them together, which signifies ten, then beginning with the toes they count twenty, after which they are confounded, and cry, "Where shall I take more."

They divide the year into ten divisions, some of which are longer and others shorter; for they do not make this division from the changes of the moon, but from some particular occurrences that annually return. The first division is named the purifier of sins, from holiday at that time, in which they perform some acts of purification. The second is called, the breaker of hatchets, from the great frost. The third, the beginning of heat. The fourth, the time of long days. The fifth, the preparing time. The sixth, the red fish season. The seventh, the white fish season. The eighth, the Kaiko fish season. The ninth, the great white fish season. The tenth and last, the fall of the leaf. This last continues till the month of November, or of purification, and lasts almost three months. These names, however, are only used by the inhabitants upon the river Kamtschatka; for those of the northern parts give them other names, which are different only on account of their different employments.

They commonly divide our year into two, calling the winter the year, and the summer another. The winter begins in November, and the summer in May. They do not distinguish the days by particular names, nor form them into weeks or months.

When eclipses happen they carry fire out of their huts, and pray the luminary eclipsed to shine as formerly. They know only three constellations, the great bear, the pleiades, and the three stars in Orion. They have no writings, nor hieroglyphics to preserve the memory of any remarkable events; so that all their knowledge depends on tradition, which soon becomes fabulous and uncertain with respect to what is past.

S E C T. VIII.

Of the Method in which the Kamtschadales make War. The Tax they pay to Russia. The Russian Forts erected in the Country, and the Manner in which the Cossacks live at Kamtschatka.

BEFORE the Kamtschadales were conquered by the Russians they did not appear to have the ambition of enlarging their territories, or increasing their power, and yet the quarrels that arose between themselves were so frequent, that a year seldom passed in which some village was not entirely ruined. The motives of these wars were unjust, and frequently trifling: they fought in order to take prisoners, that they might employ them, if males, in doing their laborious work; or, if females, make them either their wives or concubines. At other times neighbouring villages went to war for quarrels that happened among their children, or for neglecting to invite each other to their feasts.

Yet they are such cowards, that unless forced by necessity they never openly attack an enemy, which is the more extraordinary as no people seem to despise life more than they, or are more frequently guilty of self-murder. In the night time they steal into the enemy's village, there being no watch to oppose them, and securing the entrance of the huts, knock down all who come out, and bind them fast. The males especially, if they are of any consequence, are treated with the utmost barbarity, as burning, cutting them to pieces, tearing out their entrails while alive, and hanging them by the feet. Soon after the conquest of Kamtscharka, this was the fate of several Russian Cossacks; and these barbarities were exercised with rejoicing and triumph.

These

These quarrels among themselves rendered it easy for the Cossacks to subdue them; for the natives on seeing them attack one village, were so far from assisting their countrymen, that they rejoiced at their destruction, without considering that they would soon suffer the same fate. They indeed destroyed more of the Cossacks by treachery than by arms; for on their coming to any village to demand the tribute, they were received in the most friendly manner, and the tribute not only paid them, but they had presents made them for receiving it. Thus having lulled them into a state of security, they either cut their throats in the night, or set fire to the huts of their neighbours, and burnt them with all the Cossacks that were with them. The Cossacks are now upon their guard, and are particularly afraid of extraordinary caresses, and always expect some treacherous design when the women in the nighttime leave their huts.

Whenever they hear that troops are marching against them, instead of meeting their enemies, they retire to some eminence, which they fortify as strongly as possible, and building huts there, wait till they are attacked. They then bravely defend themselves with their bows and arrows, and every other method in their power; but if they find the enemy is likely to make themselves masters of the fortresses, they first cut the throats of their wives and children, and then either throw themselves down a precipice, or, with their arms in their hands, rush upon their enemies, and sell their lives as dear as possible.

Their arms are bows and arrows, spears, and, what may be called, a coat of mail: their quivers are made of the wood of the larch-tree, on which is glewed birch bark; their bow-strings are the blood-vessels of the whale, and their arrows, which are about four feet long, are all poisoned, so that whoever is wounded by them usually dies in twenty-four hours, there being no other remedy but sucking out the poison; and their coats of mail are made of mats, or the skins of sea-horses and seals, cut into thongs, and platted together. They put them upon the left side, and tie them with thongs upon the right; behind they fix a high board to defend their head, and another before as a breast-plate.

The taxes they pay to Russia consist of only one skin of such creatures as every man is used to hunt, such as fables, foxes, and sea-beavers; and justice, except in criminal cases, is administered by their own chiefs.

There are five Russian forts in Kamtschatka; these we shall particularly mention; only we shall first observe, that a werst is somewhat less than three quarters of an English mile. The Bolscheretskoi fort stands on the northern bank of the great river, thirty-three wersts from the Penschinska sea. This fort is seventy feet square, and is fortified on the east and north sides with pallisades, as is the south and west with different buildings. Beyond the fort is a church consecrated to St. Nicholas, with a belfrey erected upon pillars. It contains about thirty houses, one public house for selling brandy, and a distillery. It is defended by forty-five Cossacks.

The upper fort of Kamtschatka stands upon the left bank of the river of the same name, two hundred and forty-two wersts from the Bolscheretskoi fort. This building is seventeen fathoms square; the gate fronts the river, and over it is a warehouse. Within the fort are two magazines, the office for receiving the taxes, and a room for keeping the hostages. On the outside is also a church consecrated to St. Nicholas, the commissary's house, a distillery, and twenty-two private houses for the accommodation of the garrison, which consists of fifty-six Cossacks.

The lower Kamtschatka fort is three hundred and ninety-seven wersts distant from the former, and is situated upon the same side of the river, about thirty wersts from its mouth. This fort is a parallelogram made with pallisades: it is forty fathoms broad, and forty-two long. Within it is a church dedicated to the Virgin Mary, the office and magazine for the taxes and stores, and a commissary's house, all built of larch wood. Without the fort are twenty-nine private houses, a public house, distillery, and ninety-two male inhabitants. Game is here in such plenty, that the poorest Cossack seldom dines without a swan, goose, or duck.

The fourth fort is built upon the bay of Awatscha; its

greatest beauty is its church, which is well built in a fine situation.

The fifth fort is erected upon the river Teghil, and is garrisoned with thirty-seven male inhabitants; but we have no account of its form.

The Cossacks who are at Kamtschatka, live much in the same manner as the natives; they feed like them upon fish and roots, and their employments are nearly the same. The only difference seems to be, that the Cossacks live in houses, and the natives in huts under ground. The Cossacks generally eat their fish boiled, and the natives mostly dry. As it is impossible for people to live there without the help of women; who are very necessary to clean their fish, dry their roots, and to make their cloaths, and as the Cossacks first settled there without their wives, it will be proper to observe by what methods they procured them. The Cossacks did not reduce these people without meeting with opposition, and in their wars with the natives they took many women and children, as well as men prisoners, and obliged them to perform all the labour. The care of overlooking these servants was intrusted to those whom they made their concubines, whom they frequently married if they had any children by them; and sometimes the natives offered them their daughters, whom they promised to marry as soon as a priest arrived. Thus it sometimes happened, that the Cossacks had a marriage and a christening at the same time; for there was only one priest in Kamtschatka, who once in a year or two visited the settlements.

The Cossacks, who are themselves extremely rude, were well pleased with this manner of life, and obliged their slaves to furnish them with fables and other furs in abundance, while they spent most of their time in playing at cards. Before there were any brandy shops, they used to meet in the office where the tax was received; there the gamesters brought their furs, and when they had none they brought their slaves, and sometimes played till they had lost both them and all their cloaths. This way of life was attended with great confusion; for the poor slaves were sometimes obliged to change their masters twenty times a day.

The goods demanded in Kamtschatka, besides the natural produce of Russia, are many sorts of European goods, as coarse cloaths of various colours, ferges, linen, silk and cotton handkerchiefs, red wine, tobacco, some sugar, and several toys: from the other parts of Siberia unwrought iron, knives, hatchets, saws, and fire-steels; also wax, hemp-yarn for nets, tanned deer-skins, coarse Russian cloth and linen: from Bokaria and the country of the Kalmucks several sorts of cotton stuffs: from China silk and cotton stuffs, coral, tobacco, and needles, which are preferred to those brought from Russia: from the Koreki they buy great quantities of rein-deer skins, both dressed and undressed, which they can always sell in what quantities they please. The goods brought from Kamtschatka consist of furs, as foxes, fables, sea-beavers, and a few otter-skins. As there was formerly no money in the country, they gave furs in exchange for what they wanted; and now they have money, the price is fixed by the skins, reckoning a good fox skin at a ruble. The produce of Kamtschatka, on being carried from thence, pay ten per cent duty, and the fables twelve.

SECT. IX.

Of the KURILES.

Their Persons, Dress, Customs, and Manners; their Hospitality to Strangers; their Method of catching Foxes and Beavers; a ridiculous Way of punishing Adulterers; their Religion and Treatment of their Idols.

THE Kuriles, who inhabit the southern point of the peninsula of Kamtschatka, from their form and external appearance, seem a very different people from the Kamtschadales. They are small of stature, have black hair, a round visage, and are somewhat swarthy; but have better features than any of their neighbours. Their beards are thick, and their whole body is pretty hairy, in which respect they differ from the other inhabitants of Kamtschatka. The men shave their heads as far back as the crown; but behind allow their hair to grow to its full length: a custom they probably borrowed from the Japanese,

nose, with whom they have some commerce. The women cut only the hair over their forehead, that it may not hang over their eyes. The men have their lips blackened about the middle; but those of the women are entirely black: their arms are also stained with different figures as high as the elbow: this is a custom they have in common with the Tchukotskoi and Tungusi. Those of both sexes wear silver ear-rings, which they obtain from the Japanese.

Their cloaths are made of the skins of foxes, sea-fowls, sea-beavers, and other amphibious animals, and are commonly formed of the skins of very different creatures, so that a whole suit is seldom seen of the same sort of skins. The fashion has a nearer resemblance to that of the Tungusi, than to that of the Kamtschadales. But though they pay so little regard to uniformity of dress in the cloathing of their native country, they are very fond of acquiring such as are made of silk, cloth, or serge, particularly those of a scarlet colour; yet when they have them they will wear them when about their dirtiest work.

Their huts resemble those of the Kamtschadales, but they generally keep them cleaner, and cover the walls and floor with mats. Their principal food consists in amphibious animals, and they eat very little fish. During the summer, instead of travelling by land, they coast the country, or sail up the rivers in boats; and in the winter travel with snow shoes. In the summer the women attend their husbands in hunting; and in the winter they are busied in sewing, while their husbands are employed in killing the amphibious animals that approach the shore.

These people are more civilized than those of the neighbouring nations; for they are perfectly honest and peaceable: they have a soft and modest way of speaking: the old they treat with respect, and behave with affection to each other, particularly to their relations. It is impossible to see without pleasure the friendly and hospitable reception they give to their friends who come to visit them from the Kurilski islands. Those who come in boats, and those that leave their huts to receive them, march with great ceremony in all their warlike accoutrements, shaking their spears and swords, and bending their bows as if going to engage an enemy. They thus dance up to each other till they meet, and then embrace, clasping each other in their arms, and shedding tears of joy. The people of the huts then conduct their visitors to their habitation, where, standing around them, they hear them relate all the adventures of their voyage. The eldest man has the honour of making this relation, and he informs them of every thing that has happened since their last meeting; how they lived, how they were employed, where they travelled, what good or ill fortune they have experienced, and the like. This relation sometimes continues three hours; and, when he has ended, the eldest of those who are visited gives him also an account of all that has happened to them. Before he has done the rest must not so much as speak to each other, and then they either condole or join in congratulations, and finish the entertainment with eating, singing, dancing, and telling of stories.

The Kuriles catch foxes in a manner peculiar to themselves: they have a net made of the hair of whales beards, composed of several rings; this being spread upon the ground, they bind a magpye to a ring in the middle, and round the neck draw a cord, the ends of which are held by a man concealed in a pit; who, when the fox springs upon the bird, draws the cord, and gathers the net together, which surrounds the fox as a drag-net does the fish. In order to catch bears, they fasten a snare upon a tree, and place behind it a proper bait; which the bear endeavouring to seize, is held fast by the head or paw. Another method is to lay a board driven full of iron hooks in the bear's track, near which they place something that easily falls. This frightening the bear, he runs with greater force on the board; when finding one of his fore-paws wounded and seized by the hook, he endeavours to free himself by beating the board with the other; and thus both being fixed, he rests on his hinder-legs, which causes the board to rise before his eyes, and so perplexes him, that, growing furious, he beats himself to death.

The Kuriles differ but little from the other Kamtschadales in their courtships, marriages, and the education of their children. Though they have two or three wives, they never publicly sleep with any of them; but steal

to them privately in the night. They have a very extraordinary and ridiculous method of punishing adultery. The husband challenges the adulterer to accept of a match at beating, which is thus performed: when they meet they both strip naked, and the injured challenger gives the other a club about three feet long, and near as thick as a man's arm; and then the challenger is obliged to receive three strokes upon his back from the adulterer, who then returns him the club, and is treated in the same manner. This they perform three times, and it is generally followed with the death of both; but it is esteemed as great a dishonour to refuse this way of fighting, as it is in Europe to refuse complying with a challenge: but if the adulterer prefers his safety to his honour, he must pay the husband whatever he demands, either in provisions, cloaths, skins, or the like.

These people are as ignorant of the Deity as the Kamtschadales. They have idols in their huts made of chips or shavings, curiously curled. They call them Ingool, and are said to pay them a kind of veneration; but whether as good or evil spirits is not known. To them they sacrifice the first animal they catch, but they eat the flesh themselves, and hang up the skin before the image. When they change their huts they leave the skin and the idol behind; but if they make any dangerous voyage, they take the idol with them; and, in case of imminent danger, throw their god into the sea, in order to pacify the storm: yet in all their excursions think themselves safe while they have this protector with them.

The women are said to have harder labours than those of the Kamtschadales; and, if they have twins, one of the unhappy infants is doomed to death. Self-murder is as frequent here as among the Kamtschadales. Such persons as die in summer are interred in the earth, but in the winter they are buried in the snow.

SECT. X.

Of the KOREKI and TCHUKOTSKOI, or TCHUKTCHI.

THE Koreki are divided into the Rein-deer, or Wandering Koreki, and those that are settled in one place, who live in huts in the earth like the Kamtschadales, whom almost in every other respect they also imitate.

The Fixed Koreki inhabit the coast of the Eastern Ocean, from the river Ukoï as far as the Anadir, and along the coast of the sea of Penschina, round the Penschinabay to the ridge of a mountain called Naktchatmnin, out of which rises the river Nuktchan.

The Koreki are from these rivers distinguished by different names. The Wandering Koreki remove to the west with their herds from the Eastern Ocean to the head of the rivers Penschina and Omolona; they ramble towards the north as far as the Anadir, and southward to the rivers Lefnaya and Karaga. They sometimes approach very near to Kamtschatka; but this never happens, except they are in fear of being molested by the Tchukotskoi, who are their most dangerous neighbours. The people they border upon are the Kamtschadales, the Tchukotskoi, the Ukageri, and the Tungusi or Lamuti.

The Koreki differ not only in their behaviour from one another, but also in the form of their bodies. The Wandering Koreki are low of stature, and very lean; they have small heads, and black hair, which they shave every day; their face is oval, their eyes small, and shaded with hanging eye-brows; they have a short nose, a wide mouth, and a black and pointed beard, which they frequently pluck. The Fixed Koreki are somewhat taller and thicker than the former, especially those that live towards the north, who resemble the Kamtschadales and Tchukotskoi.

Besides, there is a great difference in their habits and customs. The Wandering Koreki are extremely jealous, and often kill their wives upon suspicion only; but when any are caught in adultery, both parties are condemned to death. On this account the women seem to strive to render themselves disagreeable; for they never wash their hands and faces, nor comb their heads; and their upper garments are ragged, dirty, and torn, the best being worn underneath. This proceeds from the jealousy of their husbands, who assert, that a woman has no need

to adorn herself, unless she intends to gain the affections of strangers; for her husband will love her without it.

But the Fixed Koreki consider it as the most certain mark of friendship when they entertain a friend, to put him to bed to his wife or daughter; and his refusal to comply would be considered as such an affront, that they are capable of murdering a man for it. The wives of the Fixed Koreki therefore adorn themselves as much as they can, by painting their faces, wearing good cloaths, and endeavouring to set off their persons. They even sit naked in their huts in the company of strangers. The whole nation is rude, passionate, revengeful, and cruel; and the Wandering Koreki are equally proud and vain: they think no people upon earth so happy as themselves, and consider all the accounts given by strangers of other countries as entirely fabulous; for, say they, "If you enjoy these advantages at home, why did you take the trouble of coming to us? You seem to want many things which we possess; while we are satisfied with what we enjoy, and never come to seek any thing from you."

The pride of the Wandering Koreki appears owing to the respectful awe with which they are treated by the Fixed Koreki, who are never known to do them the least injury: this can only be attributed to the respect which the poor generally pay to the rich. Hence the Rein-deer Koreki call the others their slaves, and treat them accordingly, though they are much their superiors in number; but, at the same time, are so afraid of the Tchukotskoi, that fifty of the Rein-deer Koreki would fly before twenty of them; and were it not for the protection of the Cossacks, the Tchukotskoi would have extirpated the whole nation.

The Koreki live in such places as abound with moss for their rein-deer, without concerning themselves about the scarcity of wood or water; for during the winter they use melted snow, and for firing, moss or grass. Their way of life, especially in that season, is even more disagreeable than that of the Kamtschadales; for as they are frequently obliged to change their habitations, the huts to which they remove are frozen; and on their attempting to thaw them with fires made of green shrubs or grass, there arises a smoke that is extremely pernicious to the eyes. Their huts resemble those formed by other wandering nations: in the winter they are covered with raw deer-skins, and in the summer with those that are tanned. They have no floorings or partitions, but only four stakes in the middle, between which is their hearth: to these they generally tie their dogs, which frequently drag the meat out of their kettles while it is dressing. Indeed, a man must be very hungry before he can eat with them; for, instead of washing their kettles or platters, they are satisfied with their dogs licking them; and the very flesh they tear out of the mouths of these dogs, they, without washing, throw again into the kettle.

The Tchukotskoi, or Tchuktchi, live upon the banks of the river Anadir, and extend along the shore to the north and north-east as far as the Cape of Tchukotskoi, which, according to the Russian maps, is in seventy-four degrees north latitude, where the sea turns to the west; one side of that promontory being washed by the Eastern Ocean, and the other by the Frozen Sea. Those who dwell on that promontory keep tame rein-deer, and frequently change their habitations between the rocks, while those who have no rein-deer dwell on the banks of the sea, where the sea-horses usually come on shore; these last live by hunting wild rein-deer, and on the flesh and fat of the whales, sea-horses, and seals, feeding also on roots and herbs. The Tchukotskoi who live to the north of the Anadir, are not subject to Russia; but frequently make incursions upon those that are, killing and making them prisoners, and driving off their herds of deer. During the summer they fish not only in the seas near the mouth of the Anadir, but even come a great way up the river, when those subject to Russia frequently fall into their hands.

When a stranger comes to visit these northern Tchukotskoi, whether he be of their own nation, or of any other, they at the first salutation offer him their wives and daughters, for his bed-fellows; but if they are too disagreeable or too old for the guest, they bring him some from among their neighbours; and the woman he chooses presents him a basin of her own urine, made in his presence, with which

he is obliged, in point of honour, to rinse his mouth; but if he refuses the offer, they esteem him their enemy; and, from his accepting it, conclude him their sincere friend. This circumstance, so contrary to the customs of all nations, is mentioned by the Russians who have been amongst the Tchukotskoi, and was confirmed by the Tchukotskoi themselves at Anadirsk.

The winter-huts of the Tchukotskoi are much warmer and more spacious than those of the Koreki. In the same huts live several families, that have their separate benches covered with deer-skins, on which they sit or sleep. Upon each bench a lamp of fish-oil, with a wick of moss, burns day and night. On the top they have an opening that serves for a chimney; and they are so warm, that in the coldest places the women sit naked; but they are almost as smokey as those of the Koreki.

Their cloaths are made of the skins of rein-deer, in the same manner as those of the Kamtschadales. The rein-deer are so extremely numerous, that some of the rich have ten or twenty thousand; and yet are so penurious, that they are loth to kill them for their own use, and are contented with eating such as die of themselves, or are killed by the wolves, which frequently happens. However, for a particular friend, they will kill one of their own herd.

They never milk the rein-deer, nor do they know the use of milk; they eat their flesh boiled, and what is not immediately consumed they dry with the smoke in their huts. They eat every other animal, except dogs and foxes; and in general eat neither herbs, roots, or the bark of trees; though the poor feed on them in times of great scarcity. They eat berries only fresh in the summer, and save none of them for the winter. Mr. Krascheninoff observes, that he saw one of their chiefs greatly surprised at the first sight of sugar, which he took for salt; but tasting it, was so pleased with its sweetness, that he begged some pieces to carry to his wives; but being unable to resist the temptation of so delicious a rarity, he eat it all up by the way, and when he came home, told them he had tasted salt sweeter than any thing he had ever known; they would not believe him, and insisted, that nothing could be sweeter than cranberries with deers fat and lilly roots.

The Koreki are entirely ignorant of all the rules of civility; they not only make no compliments, but treat strangers with an air of superiority. However, when they entertain their guests, they give them what they have in sufficient plenty, without obliging them to over-eat themselves. Their favourite food is fat meat, for all these savage nations are excessively fond of fat. The Tchukotskoi would lose an eye for a fat dog, and the Jakutski for a piece of fat horse-flesh. The latter know that the stealing of cattle is punished with the loss of all their goods; yet when an opportunity offers they cannot refrain from stealing a fat horse, comforting themselves amidst their misfortunes, with their having once in their lives made a delicious meal.

In their marriages the rich are united to the rich, and the poor to the poor, with very little regard to personal charms, or any other accomplishment. They generally marry into their own family, and with any relation, except their own mother or daughter. Tho' the bridegroom should be ever so rich, he is obliged to serve five, or at least three years for his bride; but during that time they are allowed to sleep together, though the form of catching the bride is deferred till the marriage is celebrated, which is done without much ceremony. They have two or three wives, whom they keep at different places, giving them an herd of deer, and a person to look after them.

They are very fond of their children, whom they inure from their infancy to labour and economy. The old women give the children their names, on which occasion they set up two rods, which they tie together with thread, and between them hang a stone, wrapt in a piece of sheep-skin; they then ask in a muttering voice the name they shall give, and mentioning those of several of their relations, whatever name the stone shakes at, they give to the child. The child-bed woman never shows herself, nor leaves her hut for ten days; and if during that time they remove their habitations, she is carried in a covered sledge. The children suck till they are three years old, but have neither

neither cradle nor swadling cloaths. Their sick are carefully attended, and their shamans or forcerers beat a little drum to drive away their distempers. These are their physicians, though they are but little acquainted with the virtues of plants.

When a person is dead they erect a great pile of wood, and having dressed the deceased in his finest apparel, cause him to be drawn by the deer which they imagine were his favourites; then placing the body on the pile, throw upon it his spear, quiver, arrows, knives, hatchets, kettles, and other furniture. They then set fire to the pile, and while it is burning, kill the deer that drew the corpse, and having feasted upon it, throw the fragments into the flames. A year after the person's death all the relations assemble, and taking two young rein-deer that have never drawn a sledge, and a number of horns, which during the whole year, they have collected for that purpose, they go to the place where the body was burned, if it be near, or if it be at a distance, to some other high place, where they kill the deer; and the shaman driving the horns into the earth, pretends that he sends a herd of deer to the deceased. They then return home, and in order to purify themselves, pass between two rods fixed in the ground, while the shaman, beating them with another, intreats the dead not to carry them away.

The Koreki only ride on sledges drawn by rein-deer during the winter, but never mount upon their backs in the summer, as it is said the Tungusi do. Their sledges are about six feet long, and their sides about four inches thick; but rather thinner at the fore part, where they are bent upwards. They yoke two deer before every sledge. They have collars something like those of horses, and also bridles and reins, with four little sharp bones upon the deer's forehead, which are used as bits to pull them in; for these bones, piercing the skin, make them stop. They are only put on the head of the right-hand deer; for if he stops, the other cannot proceed. They drive them forward with a goad about four feet long, that has a sharp bone at one end, and a hook at the other. They prick the deer with the bone to make him go forwards, and with the hook lift up the harness. The rein-deer run much swifter than the dogs, and will go one hundred and fifty versts, or near a hundred miles a day; but care must be taken to feed them frequently. They geld some of the males, by piercing the spermatic vessels, and tying them with thongs. The Settled Koreki have very few rein-deer; and these are only used for drawing; but the Tchukotskoi have great herds, and yet generally feed upon fish and amphibious animals.

The religion of the Koreki is as absurd as that of the Kamtschadales: they seem to have a great respect for evil spirits, which they suppose inhabit the fields and woods; but this respect seems entirely owing to fear. They have no regular times of worship, but whenever they please, kill either a rein-deer or a dog, and fixing its head upon a stake, turn its face towards the east, crying, "This is for you; and may you send us something that is good;" after which they immediately retire. When they are going to pass a river or desert, which they imagine is inhabited by evil spirits, they kill one of their deer, and eating the flesh, fasten the bones of the head upon a pole.

Before they became subject to the Russian empire, they had no magistrates, only the rich had some authority over the poor, nor had they then the form of an oath. At present, instead of swearing upon the gospel, the Cossacks oblige them to hold a musquet by the barrel, threatening that whoever does not observe this oath, will be shot by a ball; which they are so much afraid of, that rather than run the risk of being thus killed for perjury, they will, if guilty, confess their crime.

Their other customs resemble those of the Kamtschadales.

Before we leave the coast of the eastern ocean, we ought not to omit observing, that from the late discoveries of the Russians, it appears that the continent of America is scarce more than two degrees and a half from the cape of Tchukotskoi, from which, and the neighbouring shore of Asia, it seems to have been once separated by an earthquake. The American continent is there known from fifty-two to sixty degrees north latitude. It enjoys a much better climate than the coast in the same latitude on the

north-east side of America; for at sixty degrees the shore is covered with wood.

But it is not for us to dwell here on this new discovered land; our province is at present Asia: we shall therefore leave a farther account of this country, till we have almost encompassed the globe. Mean time those who are impatient to learn a farther account of this part of America, with respect to the land, the animals, and the inhabitants, may obtain satisfaction by having recourse to a very judicious and entertaining work lately published, entitled, *The History of Kamtschatka, and the Kurilski islands, with the countries adjacent*; published in the Russian language by order of her Imperial Majesty, and translated into English by James Grieve, M.D.

SECT. XI.

Of the TUNGUSI.

Their different Tribes, as the Sabatschi Tungusi, the Oleni Tungusi, and the Konni Tungusi. Their Dress and Manner of Life.

THE Tungusi are a most numerous pagan nation dispersed in different tribes through very distant parts of Siberia, and are supposed to amount to seven or eight thousand men; they are distinguished into the Konni Tungusi, or those that make use of horses for riding, and draught: the Oleni Tungusi, or those who use rein-deer for those purposes; and the Sabatschi Tungusi, or those who use dogs.

These tribes are easily perceived not only to spring from the same stock, but to be of the old Scythian or Tartaric extraction, since they seem to retain much of the same customs and inclinations; but they are taller and of more bravery and antiquity than most of the other Siberians. Among the Sabatschi Tungusi, who live between the Lena and the Penschinska sea, both the men and women go naked in summer, wearing only a piece of a skin about a span broad round the waist; but in cold weather they are clothed with the skins of rein-deer with the hair outward, and their stockings, breeches, and coat, are all of a piece, but the cap is generally made of some other fur, according to the fancy of the wearer.

In summer they live on fish, and in winter on the game they kill; for they breed up no other cattle but dogs and rein-deer.

They acknowledge a Supreme Being, but pay their adorations only to some ill-shaped wooden idols of their own making. They hang their dead upon trees till the flesh is rotted off, or devoured by birds, and then bury their bones. The men and women of distinction are known by black spots made on their faces and hands, which they are accustomed to consider as a singular ornament.

The Oleni Tungusi, who dwell near the springs of the Lena and Aldan, north of that of the Sagalian-ula, or the Amur, live much after the same manner; but besides the game and fish they catch, they live upon the milk of their cattle, which they breed up in great numbers, and sometimes feast on their flesh, as well as cloath themselves with the skins. These are esteemed somewhat less barbarous than the rest. Instead of bread they use onions, and the roots of yellow lilies, which, when dry, they either make into a kind of meal, or boil up into a pap, as they fancy best. They have a strange way of administering oaths to each other, which is thus performed. He that gives the oath stabs a dog in the belly, and holds the wound to the man who swears, and who sucks the blood as a proof of his veracity; for they imagine he would immediately burst if he swore falsely. Their chief weapons are the broad sword, cutlass, and hatchet, the first of which hath lately been brought among them.

A small canton of the Oleni Tungusi is under the dominion of the emperor of China; but all the rest are subject to the Czarina, and annually pay their quota of furs.

The Konni Tungusi, who are situated between the lake Baykal and the city of Newzinskoi along the river Amur, are commonly very strong and courageous, nimble and active, and as they generally go armed, they are trained up to use their weapons, as well on horseback as on foot. Both men and women ride a horse with great dexterity.

S E C T. XII.

*Of the JAKUTI or JAKUTZK.**Of its Situation, Climate, and Produce, with the Manners, Customs and Religion of the Natives.*

THE province of Jakuti or Jakutzk lies to the north. The cold here, and in the other northern parts of Siberia, exceeds that of almost every other country upon earth; but Providence has kindly dealt out to the inhabitants wood for fuel, and furs which they use to preserve them against the severity of the weather. Even ice itself is converted into a fence against the cold; for in the northern parts, particularly at Jakutzk, it is usual to hew a piece of transparent ice, of the size of the hole, which serves the peasants for a window; and having placed it on the outside, they sprinkle a little water at the edges, which immediately freezes, and cements the ice in the hole. This ice window keeps out the wind and cold, without much diminishing the light. Those who have also glass windows, place them on the inside of the hole, that they may not be incommoded with the moist effluvia of the ice; but the common people do not regard this. These severe winters are succeeded by warm and delightful summers, when the heat is so intense, that the Tungusians, who inhabit the province of Jakutzk, go almost naked. Here is hardly any night during that season, and towards the Frozen Ocean, the sun continually appears above the horizon. The vegetables and fruits of the earth are here extremely quick in their growth. Thunder is seldom heard near the Ice Sea, though the south part of Siberia is subject to dreadful tempests. In the most northern parts of Siberia, beyond the sixtieth degree of latitude, neither corn nor fruit grows, but they are supplied with corn from the southern, where the fertility of the soil is surprizing. Their want of fruit is richly compensated by the great plenty of tame and wild beasts, and fowls, and the vast variety of fine fish.

Jakutzk produces some corn, but the inhabitants being more intent upon hunting fables, foxes, and other animals, for the sake of their furs, neglect cultivating the earth. Though the little corn sown in the country soon ripens, the straw never exceeds six inches in height; for the corn no sooner peeps out of the ground, than it shoots into ears, and ripens in six weeks time: the reason of which is, that the sun is here in summer hardly ever below the horizon, but cherishes the earth by its warmth both night and day. It is worthy of remark, that during this whole time it never rains, and that the earth never thaws above nine inches deep. Thus the roots are plentifully supplied with moisture from below, while the constant heat of the sun above invigorates what is above the ground.

There are here pretty large horses, which being turned out all the winter long, scrape the snow aside with their hoofs to come at the grass. They also eat the buds of the birch and aspen tree, and growing sleek, plump, and fat, during the severity of winter, they appear much handsomer than in summer, when their hair grows long.

The city of Jakutzk is the capital of the province, and is situated on the river Lena, above four hundred miles from the Frozen Sea, and is the residence of the governor-general.

These people compose one of the most numerous pagan nations in Siberia, and consist of ten tribes, all of which amount to about thirty thousand men taxed by the Russians. The natives offer sacrifices to the invisible God of heaven, yet have a wretched type or image of him stuffed out with a monstrous head, eyes of coral, and a body like a bag. This image they hang upon a tree, and surround it with the furs of fables and other animals. Each tribe has one of these images; and they have all many superstitious customs in relation to particular trees, which they consider as sacred; and when they meet with a very fine one, hang upon it pieces of iron, brass, and copper. While they are performing their superstitious rites, their bihuns or priests wear a garment adorned with bits of iron, rattles and bells.

The fields no sooner begin to be covered with verdure, than each tribe assembles at a place where there is a fine tree, and a pleasant spot of ground, and there they sacri-

fice horses and oxen as a new year's offering, and stick up the heads round the tree. Then taking a certain liquor, which they call cumises, they sit down in a circle, and having drank to each other, dip a brush in the liquor, and sprinkle some in the air, and some into the fire, which they light upon that occasion. At this festival they get intolerably drunk, and gorge themselves to excess.

They eat the flesh of cows and horses, but no pork, though ever so hungry; yet they never regard whether the cattle be sick or sound. They are extremely nasty; the vessels in which they stamp their dried fish, roots and berries, are made of cows dung dried; and the cattle stand in the same hut where they themselves dwell. They are fond of smoking tobacco, which they procure from the Russians in exchange for their furs. In February and March, when the sap rises in the trees, they go into the woods, and cutting down young pines, take off the inner bark, and carrying it home, dry it for their winter's provisions; they then beat it to a fine powder, boil it in milk, and eat it with dried fish, which is also beat to powder.

Their winter huts are square, and made of thin planks and beams, the roof is covered with earth, and a hole as usual is left in the top to let out the smoke. Their summer dwellings, which are round, and in the shape of a sugar-loaf, are covered on the outside with the bark of birch-trees, curiously joined and embroidered with horse-hair of many colours. A hole is also left at the top for the passage of the smoke; and the fire is made in the midst of the hut, where they fix a hook to hang their pots on; these they make themselves, as they do also their kettles.

They have different ways of disposing of their dead: persons of distinction sometimes pitch upon a pine-tree, and declare they will be buried under it; and when the corpse is interred, some of the best moveables that belonged to the deceased are put along with him into the grave. Some only place the corpse upon a board, which they fix in the wood upon four posts; then covering the body with a horse's or an ass's hide, leave it. But most of them when they die are left in their huts, and their relations, taking the most valuable things, close up the door, and remove to another hut.

Among these people each tribe looks upon some particular creature as sacred; for instance, a swan, a goose, or a raven; and these are not eaten by that tribe, though the others may eat it without offence.

S E C T. XIII.

Of the Bratski, the Kamski, the Barabinski, and the Mahometan Nations on the Banks of the Irtysh; with a particular Account of the Osiacs, their Manners, Customs, Religion, and Form of an Oath.

NEAR the lake of Baikal are the Bratski Tartars, some of whom enjoy great affluence; for it is not unusual there for a private man to have four or five hundred horses, and a proportionable number of other cattle. They live chiefly on venison, but esteem horse-flesh a much greater dainty. They drink mare's milk, and also a strong spirit which they distil from it. They apply themselves to agriculture and trades, and many of them are expert mechanics. They purchase their wives with their cattle, and often give an hundred horses or oxen for a virgin whom they admire. They worship an idol formed of the skins of beasts, and hung up in their huts.

Somewhat farther to the west live the Kamski Tartars in huts covered with bark. They are pagans, and their food is fish and venison, which they eat raw as well as dressed, and roots serve them instead of bread.

Farther to the west is the great desert of Baraba, in which the Barabinski live during the winter, which they employ in hunting of fables; but in summer they remove to the banks of the rivers, where they employ themselves in fishing. They are pagans, and seem to live very wretched lives. Their houses are low in the ground, and their roofs, which rise about three feet above the surface, are covered with rushes or skins. The desert affording no water, they drink melted snow, and eat dried fish and barley-meal. They scarce know the use of

money; but for a little tobacco a man may purchase any thing they have. They, like the rest of the Siberians, wear coats, caps, and stockings made of pieces of fur sewed together.

Along the river Irtysh live a Mahometan nation that is wealthy in cattle, the people having numerous herds and flocks. Their habit resembles that of the ancient Russians, and the women wear rings in their nostrils. Their principal food is venison, dried fish, and barley-meal, which they make into a paste, and eat much in the same manner as some of the Indians do their rice. Like most of the Tartars they drink mare's milk, and sometimes tea, which they mix with flour and butter. At great entertainments they generally dress a young horse, and drink a liquor called braga, distilled from oat-meal and mare's milk, with which they often get drunk. They pay a tribute to Moscow of fables, fox-skins, and other furs, notwithstanding their having princes of their own.

Farther to the west are the Ostiacks, who extend along the rivers Oby and Jenisy, and on many of the rivers which fall into them: they employ themselves in hunting and fishing. In summer they take and dry the fish which serves them in the winter; and when that season begins, they go into the woods with their bows and arrows, their dogs and nets, to kill fables, ermines, bears, rein-deer, elks, martens, and foxes. Part of these furs is paid as a tax to the empress, and the rest are sold at a stated price to the Russian governors; but sometimes they are allowed to dispose of them to private persons.

They chiefly live upon venison, wild-fowl, fish, and roots; for they have neither rice nor bread. They drink for the most part water; and it is said they can dispense with a draught of train-oil. They are immoderately fond of tobacco, and of swallowing the smoke, which soon intoxicates them. In the winter they build their huts in woods and forests, where they find the greatest plenty of game, and dig deep in the earth to secure themselves from the cold, laying a roof of bark or rushes over their huts, which are soon covered with snow. In summer they build above ground on the banks of the rivers, to enjoy the convenience of fishing, and make no difficulty of forsaking their habitations. The materials of their houses consist of little more than some green poles and the bark of trees, with the skins of wild beasts for their beds.

As to their religion, they have some little frozen idols tolerably well cast, representing men and animals; but the rest are ill made, every man being his own carver. They place them on the tops of hills, in groves, and in the pleasantest places their country affords; yet they have no set time for performing religious worship, but apply to their gods for success in all their undertakings. They have no regular priests, but every old man may devote himself to that service, and the office is frequently performed by the masters and heads of families. Strahlenberg observes, that when he was among them he saw one of their temples, which was built of wood in an oblong form like a great barn, covered at the top with birch-bark. At the end of the wall supporting the gable was a kind of altar made of timber, on which were placed two idols, representing a man and woman dressed in all sorts of rags; and round these were other small figures, as deer, foxes, and hares; all which were roughly carved in wood, and also clothed in rags. They did not appear to have much devotion, nor any great reverence for their idols. When they offer sacrifices, they present the beast to the idol, and having bound it, an old man puts up the petitions of those who brought the offering; he then lets fly an arrow at the beast, and the people assist in killing it. 'Tis then drawn three times round the idol, and the blood being received into a vessel, they sprinkle it on their houses; they afterwards dress the flesh and eat it, rejoicing and singing their country songs: they also besmear the idol with the blood of the sacrifice, and grease their mouths with the fat. What they cannot eat they carry home to their families, and make presents of it to their neighbours; and they as often sacrifice a fish as a beast. At the conclusion of the feast they shout, to shew their gratitude to the idol for his attending and accepting their devotions; for they are persuaded, that the saint or hero represented by the image always attends their sacrifices, and when they are over, returns to his abode in the air.

When the Ostiacks take an oath of fidelity to the Russian government, they use the following ceremony. Having laid down a bear-skin and an axe, and holding over it a piece of bread on a knife, they say, "In case I do not to my life's end prove true and faithful to the supreme government of the country; or if I knowingly and willingly break through my allegiance, or be wanting in the duty I owe to the said supreme government, may the bear tear me to pieces in the wood; may the bread I eat stick in my throat, and choak me; may the knife stab me, and the axe cut off my head." The like ceremony is used among them in the deposition of a witness.

They purchase a wife of her relations for three or four rein-deer, and take as many as they please, returning them again if they do not like them, only losing what they gave for the purchase. Upon the birth of their children some give them the name of the first creature they happen to see afterwards. Thus the child has frequently the name of an animal, and you hear a man call his son perhaps Sabatki, or, my little dog; others call their children according to the order of their birth, as First, Second, Third, &c.

SECT. XIV.

Of SAMOIEDA, or SAMOJEDA.

Their Persons, Dress, and Houses. Of their Love of their Country. Of their Sledges and Rein-deer; their Customs, Manners, and Religion.

ON the north-west part of Siberia is Samoiëda, or Samojeda, a very extensive province on the coast of the Frozen Sea. The natives, who are called Samoiëdes, are short, thick, broad shouldered, and of a tawny complexion: for it is observed, that, in this respect, a very hot and a very cold climate have the same effect upon the skin. They have long little eyes, broad flat faces, hanging lips, with high cheek-bones, and, in general, very disagreeable countenances. Both the men and women have hair only on their head, and their nipple is as black as ebony. The hair of both the men and the women hangs at its full length, only that of the women is sometimes braided, and little bright pieces of copper and slips of red cloth are tied at the ends. The men have little or no beard.

As to their dress, they wear fur caps, with waistcoats and buskins of the same; but the women have their cloaths sometimes adorned with a red edging: their coats are made of the skins of rein-deer; and, during the winter, they have an upper coat of fur, which also serves for a cap and gloves, and almost hides the face; besides these, they in winter-time wear boots. In making their cloaths they use thread made of the sinews of animals.

In summer they live in houses made in the form of a bee-hive, with a hole at the top; but in winter they have caves under ground, to which they retreat during the severity of the weather, and are there confined eight or nine months in the year, amidst the stench of their lamps, and the closeness and filth of these subterraneous dwellings. Yet the love of society, during this long cessation from labour, induces them to make ways under ground to the habitations of their neighbours, that they may see and visit each other during these months of festivity and pleasure; which to them have such delights, that Olearius says, two of their deputies sent to the court of Moscow told him, that if the Czar knew but the charms of their climate and country, he would doubtless chuse to go and live among them. They confessed themselves tired of the hurry and vain glitter of the court, and impatient to return to their dear native soil. Thus has Providence wisely implanted in the human mind this love of the land where man first drew his breath, and was reared from infancy to active life; to sweeten the rigours of every climate, and dispense happiness in plenteous streams to those human beings, whom we, fond too of our native soil, are apt to esteem miserable.

The Samoiëdes live upon the flesh of horses, oxen, sheep, deer, and fish; but think it has the best relish when it begins to grow tainted. Hence the horse-flesh and other

other meat which hang round the inside of their huts render them extremely offensive to any one not used to them. They are said to prefer the entrails of an animal to any other part; and use at their meals neither bread, rice, nor salt.

They travel in sledges drawn by a pair of rein-deer, or dogs. The sledges are about eight feet long, three or four broad, and turn up before like scates. The driver sits cross-legged, with his staff in his hand, with which he pushes and drives the rein-deer, which run with greater swiftness than a horse, holding up their heads so high that their horns touch their backs. It is said they never sweat; but when weary put out their tongues, and pant like dogs. They resemble our stags, but are stronger, and have shorter legs. Their colour is nearly white, and some of them are grey. They cast their horns every spring, and generally live about eight or nine years. The Samoiedes set nets for those that are wild, and hunt them in winter, when they are shod with wooden scates, with which they run over the snow with incredible swiftness. While they are hunting they have a kind of shovel in their hands, fastened to a long staff, and with this they throw snow at the rein-deer, to drive them towards the places where they have set their nets. These animals eat a kind of white moss, and though the snow lies a fathom deep, they will dig through to come at it.

The Samoiedes also catch the sea-dogs, which in March and April couple upon the ice. These people, covered with hair, and resembling brutes more than men, creep towards them with a large hook and line in their hands, and when they come within a proper distance throw the hook. When the sea-dog attempts to escape he commonly fastens himself upon it: but sometimes jumps into the sea with such force that he pulls the poor fisherman after him, the rope being fastened to his middle. They extract an oil from these animals, eat the flesh, and cloath themselves with the skin. They also sometimes kill rein-deer, by cloathing themselves with the skin of that beast, and creeping among them till they come within their reach, and then strike them with their darts. They purchase their wives of their relations for three or four rein-deer, in the same manner as the Ostiaks.

We learn from a gentleman, who travelled in this country, that on his asking one of the Samoiedes about their religion, he replied, that they believed there was a heaven and a God, whom they called heyha; that they were fully convinced that none were greater and more powerful than he; that all things depended on him; that he was our common father, and that good men would be happy after death. Yet they worship the sun, moon, and stars, with several kinds of beasts and birds, from whom they hope to receive benefits; they also worship images of the human form, but so ill carved and dressed, that it is difficult to discover what they represent.

They have priests among them, who pretend to magic, and to foretell future events. These they consult upon all occasions: as what success they shall have in hunting or fishing, or whether they shall recover from a fit of sickness. On their coming to inquire of him he works himself into a kind of phrenzy, and in this condition delivers his oracles.

To all these people missionaries have been sent, and many of them are said to have embraced the Christian religion, and to become members of the Greek church.

S E C T. XV.

Of the principal Cities of Siberia, particularly Tomskoy, Pohem, Tobolski, the Capital, Catharineburg, Tiumen, Jenefisk, and Irkatk.

HAVING given a general account of the most considerable of those savage nations that inhabit this vast country, we shall now mention the principal cities that have not been treated of in that account.

Tomskoy, a strong frontier town, and the capital of a province of its own name, is situated in fifty-six degrees fifty minutes latitude, and in eighty-four degrees thirty-seven minutes east longitude from London, on the river Tora, just before it falls into the Oby, and contains above

two thousand houses. On the highest part of the town stands the wooden castle defended by fourteen pieces of cannon, and in it are a cathedral built with wood, the government chancery, and an arsenal. The lower part of the town is the most populous, and is separated into two parts by the rivulet Ushaika. In that part which lies to the left, are a church, a monastery, and a nunnery; and in that part on the right, are three parish churches, and an exchange for merchants. There is also a church in the upper part of the town. The inhabitants carry on a considerable trade, it lying on the great road through all the eastern and northern parts of Siberia; and here are all kinds of tradesmen and artificers; but they are extremely indolent and slothful, owing to the cheapness of provisions and their propensity to drinking.

Narim, the capital of a territory of the same name, is situated in fifty-eight degrees fifty minutes north latitude, and is also seated on the Oby. It is a large and populous city, defended by a strong fortress, and a good garrison of Cossacks. The territory around it abounds with beavers, fables, foxes, and ermines. The banks of the Oby are near this place inhabited by the Ostiaks.

The fortress of Pohem, built by the Russians, is situated on a river that flows from the north into the Tobol, falling from a high mountain, near the coast of the Frozen Sea. The town is inhabited by Muscovites; the soil of the adjacent country being very fertile, and the woods affording a variety of wild beasts, such as wolves, foxes, fables, &c.

Tobolsk or Tobolski, the capital of all Siberia; and the residence of the governor-general, is seated in fifty-eight degrees north latitude, and sixty-seven degrees east longitude from London, on the river Irtysh near the influx of the Tobol into that river. The city is divided into the Upper and Lower town. The Upper town stands very high on the east side of the Irtysh, and the Lower on a plain between the hill and the river. Both towns taken together are of a very large circumference, but all the houses are built with wood. In the Upper town, which is properly called the city, stands the fort, which is built with stone, and contains the government court, the governor's house, the archbishop's palace, the exchange, and two of the principal churches, which are all stone buildings. The Upper town is inclosed with an earthen rampart, and has also three wooden churches, a convent, and a market; but the inhabitants are under the necessity of going down the hill for water. Besides large masses of earth fall from the hill almost every year, which obliges the inhabitants to rebuild the houses that stand near the declivity. The Lower town contains seven churches, and a convent built with stone, and has also a market. This city contains about 15,000 inhabitants. The Lower town is exposed to inundations, and there is a communication between that and the Upper town by three different ways.

The women of all ranks and ages paint, though they are in general very handsome, but have not that feminine softness which is the principal charm of the sex.

This city once carried on a considerable trade to China by caravans; but the mutual knavery of the Russian and Chinese merchants soon reduced it to a languishing state; and some differences that arose between the two powers have since entirely destroyed it.

Neiwianskoi, a town in the province of Tobolski, seated on the river Neiura, was built in the year 1701, at the expence of the crown, in order to superintend the iron-works in its neighbourhood. It consists of a wooden fort, and about eight hundred houses, most of which are built in direct lines, and form strait broad streets. Very curious and serviceable copper and brass utensils are made here.

Catherineburg, a regular town built in the German manner, is seated in the same province, 550 wersts from the city of Tobolski, and was begun in the year 1723 by Peter the First, and finished in 1726 by the Czarina Catherine his Consort, from whom it received its name. It stands on the river Issett, which runs through the middle of it, and is well fortified. All the houses were built at the expence of the government, and most of its inhabitants are officers belonging to the crown, the rest are artificers

tificers and head-miners, who have the care of the works. It consists of about 450 houses, besides the suburbs without the walls, which are in part inhabited by exiled criminals, or others who voluntarily work at the fortifications or mines for daily pay. The public buildings of the town are a wooden church, a stone edifice for the public offices, an exchange with shops, an arsenal, and a toll or custom-house. Catherineburg may be esteemed the centre of all the Siberian mine-works belonging to the crown; hence the director of the Siberian mines resides here, and issues his instructions to the other directors of the works, and passes their accounts. The water of the river Isset is raised by a dam 98 fathoms long, three fathoms high, and twenty broad, in order to supply a great number of mills and other engines belonging to the mines. All the forges and works about the town, are kept in a good condition, and the miners and artificers work with extraordinary spirit and diligence. All kinds of provisions are here sold very cheap, and when any of the workmen fall sick, great care is taken of them in the hospital, to which patients are also brought from the neighbouring works. Adjoining to the hospital is a physic garden for the use of the patients.

There are a great many copper and iron mines in this circle, and Mr. Bussling observes, that from the smelting houses here, several hundred thousand pounds are annually sent out of Siberia.

There are also found jasper, marble, porphyry, and other stones of the like kind, which abound in all parts of Siberia, where cornelians and sardonixes are also found.

Tiumen, a considerable town in the province of Tobolski, is seated on the south side of the river Tura, over which is a bridge 83 fathoms in length; and a little below it stands a fort built with stone, in which is a church of the same materials. Without this fortification are five hundred houses, six churches built with wood, and a convent of nuns, with a church. This town has two suburbs, one of which has two hundred and fifty houses, inhabited by people of all ranks and professions, three churches built with stone, and a monastery. The other suburb is inhabited by Russians, who have a church, and by Mahometan Tartars and Bucharians, who have a mosque.

Jeniseisk, the capital of the province of Jenisei, is seated on the river Jenisei, and is about six wersts in circuit. The city contains three churches, a monastery, a nunnery, an exchange for merchants, a powder magazine, and seven hundred private houses. The commodious situation of the town, causes a very brisk trade to be carried on here, especially in summer; and most of the inhabitants are more or less concerned in commerce. Here is great plenty of corn, flesh, and fowl; but the only fruit this country produces are two or three sorts of berries.

Irkutsk the capital of the province of the same name, is seated in a fine plain, near the river Angara, and is one of the most considerable and populous towns in all Siberia. It contains near a thousand good dwelling houses, and is surrounded with pallisadoes, within which are fourteen small forts, a moat, and some chevaux de frize. It is also defended by a fort without the town, near the Angara, planted with sixteen pieces of cannon. Within the city are two churches built with stone, and four with wood; and without the city are two churches, one of which belongs to a nunnery. It is the see of a bishop, and the adjacent country is diversified with hills and vallies, in which is plenty of game, as roe-bucks, elks, stags, and wild-boars, and also partridges, snipes, wood-cocks, and moor-hens, with plenty of fish.

SECT. XVI.

Of the Manners of the Russian Inhabitants of Siberia: with the Method taken by Peter the Great to people and improve Siberia.

WE shall now give a general account of the manners of the Russian inhabitants, as well as of the original natives, from the Abbé d'Auteroche, who however observes, that the rapidity with which he traversed this vast

country, would not permit him to search into the manners of the people with an attention equal to his wishes. It is however far the best that can be procured.

They profess, says he, the religion of the Greek church, but with a fanaticism that appears gradually to increase with the distance from the capital. Born in the most dreadful slavery, they have lost the very idea of liberty. Their state and situation do not admit the indulgence of artificial wants, their desires are therefore necessarily few: the people in general live great part of the year in total idleness and inactivity, shut up in their stoves, the extreme nastiness of which is not to be conceived; they are however fond of their condition, and hate the thoughts of stirring out, especially to bear arms; but if they are forced into the service, brandy, and the fear of punishment, will make them tolerable soldiers. The unwholesomeness and inconvenience of their hovels are greatly increased by the severity of the winter, which prevents their communication with the fresh air; their windows are seldom more than a foot wide, and six inches high; and in the most northern parts they are deprived of the light of the sun all the while he is passing through the southern signs; nor have they any artificial light but by splinters of birch wood, which they set on fire, and stick up in the chinks of the floor. But notwithstanding all this inactivity, confinement, and nastiness, they enjoy robust and uninterrupted health; so effectually does perpetual temperance counterbalance all that can weigh against health and life. There is scarce one among them that is weakly or deformed, and their manner of education secures to them this good fortune.

The child, as soon as it is born, is laid upon a heap of straw, or old rags, in a basket, where it sprawls about, and stretches its limbs, without any restraint; it is nourished with milk by means of a horn which is fitted to a cow's teats, but is sometimes suckled by the mother; the basket is hung at the end of a long elastic pole, so that it may easily be put in motion, and the child rocked as in a cradle; but before it can go alone, it is placed upon the ground, where it rolls about at pleasure, till it learns first to stand, and then to totter along, with nothing to cover it but a shirt, which scarce reaches to the middle of the thigh: by this management their children walk sooner than ours can stand alone. As soon as they are able they are suffered to run about, and at the end of the winter are playing in the road in the midst of the snow, while the weather is still so cold that the traveller is afraid of going out of his sledge, though he be covered with fur from head to foot. They are of a large stature, extremely muscular and strong, and live longer than the inhabitants of any other known part of the world; this, however, is not because their situation, upon the whole, is favourable to life in the tender years of infancy, but the contrary; for all the children who are not strong by constitution die soon, and none are reared but those who are born with the greatest natural advantages; more than two-thirds of the children that are born here die in their infancy, and it is common to find but three or four alive in families that have had sixteen or eighteen. Many other causes concur gradually to depopulate the villages that are scattered through this vast desert.

The small-pox frequently carries off half the inhabitants of one of these hamlets at a time, and sometimes a greater proportion; the scurvy is also very fatal among them; and where they can procure spirituous liquors, the inroads of disease and mortality are in proportion to their want of the advantages which make intemperance less fatal in other places. The venereal disease also makes great havock among these unhappy wretches, to whom the method of cure is entirely unknown.

Upon a review of all that has been here said of this immense country, it must appear to every reader accustomed to a moderate climate, as a desolate and uncomfortable region, very thinly peopled, but capable of being greatly improved and rendered valuable by a trade carried on by land, and the rivers of the country, with the empires of China and Indostan and all the kingdoms and states in the Indies: and by sea from the south-east coast near Kamtschatka to the neighbouring islands of Japan, to China, the Spice Islands, and every part of the East Indies.

Indies. Nothing then could be more politic, and at the same time more cruel, than the step taken by Peter the Great, in sending so many brave men to diffuse some beams of the learning, the arts, and the polished manners of Europe through this savage country. This has been already hinted; but it certainly will not be displeasing to our readers, if we here conclude our account of Siberia with the particulars of that extraordinary proceeding.

On the defeat of the Swedes at the battle of Pultowa, in 1709, about ten thousand Swedish prisoners, including officers, were barbarously sent into Siberia; and among these no less than eight hundred captive officers were in the city of Tobolski. During their captivity, the common soldiers received remittances from Sweden only twice, which amounted in all to no more than three crowns a head, and the officers received nothing. They were, however, well used at first, till some who had leave to be absent on their parole did not return; and others, who had entered into the Russian service, took an opportunity to make their escape. After this the unfortunate captives were more strictly guarded, and dispersed into remote parts; and those who were sureties for the return of their comrades were close confined.

The brave Swedish soldiers, who had often made the Russians fly before them, had now no means left for their subsistence, and were obliged to earn their bread by applying to the mechanic arts with which they were acquainted, in order to support themselves. There were among them painters, gold and silver-smiths, shoe-makers, turners, card-maker, weavers and tailors. These were by some means or other enabled to follow their several businesses; and some, who had fallen into a way of trade, had leave to travel about the country, the passes being so well

guarded that it was scarce possible for them to escape to Europe; while others, who could not attain the knowledge of any mechanic art, were obliged to undergo the laborious employment of cutting down wood.

The men of learning set up public schools, and not only taught the children of the Russians, but those of their fellow prisoners, many of whom had either their wives with them, or married Russian women; for the great towns of Siberia were chiefly inhabited by colonies of Russians, whom the czar transplanted thither for the security of his dominions on that side. These officers in their schools and academies taught Latin, High Dutch, French, ethics, mathematics, fencing, riding the great horse, and other manly exercises. And some of those schools acquired such reputation, that it is said the citizens of Moscow sent their children into Siberia for education.

It was perhaps impossible for the czar to take a more effectual method to civilize and improve all the principal towns in this remote part of his dominions, than by banishing thither these unhappy Swedish captives, among whom were some of the poliest men in Europe, who, upon the fame of the king of Sweden's success, had entered into his service. It was happy for those gentlemen that it was so cheap a country, that a single man might live tolerably well for seven or eight pounds a year.

To alleviate the unhappiness of their captivity, prince Gagarin, the governor of Siberia, behaved to them with great generosity, and never let any of them apply to him for relief in vain; and the Swedish officers thought they never could sufficiently applaud his humanity, and used to say, that their only misfortune was their being banished to a country so remote from their relations and friends.

CH A P. VII.

Of the L A D R O N E S.

S E C T. I.

Of the Situation, Extent, and Number of the Ladrones, or Marian Islands; the Number of the Inhabitants, and a particular Account of the Island of Guam; and of the Flying Procas used by the Natives.

WE have now described the countries situated in the most eastern part of Asia, from China to the Frozen Sea, and have given as particular an account of whatever appeared worthy of notice as our materials would allow; we shall now, therefore, return to the south-east, and describe the oriental islands, beginning with the Ladrones, which are situated about eighteen hundred miles to the east of Canton, in China.

These islands have been represented as extremely beautiful, and abounding with all the necessaries of life, by all our circumnavigators, particularly by Woodes, Rogers, and Dampier; but none of them have described them in so particular and beautiful a manner as the ingenious gentleman who compiled the account of commodore Anson's voyage round the world, to which the Rev. Mr. Walter has prefixed his name; we shall therefore here chiefly make use of what we find of those islands in that most entertaining and instructive work.

The Ladrones, or Marian islands, were discovered by Magellan, in the year 1521, who gave them the name of Ladrones, or Islands of Thieves, from the natives stealing some of his goods. From the account given of the two first the commodore fell in with, it seems probable that they were those of Saypan and Tinian, they being describ-

ed as very beautiful islands, and as lying in between fifteen and sixteen degrees of north latitude. These characteristics are peculiarly applicable to the two above-mentioned places, for the pleasing appearance of Tinian occasioned the Spaniards to give it the additional name of Fuenovista; and Saypan, which is in the latitude of fifteen degrees twenty-two minutes north, affords no contemptible prospect when seen at sea.

There are generally reckoned twelve of these islands, but if the small islets and rocks are counted, they will amount to about twenty. Most of them were formerly well inhabited; and even not eighty years ago the three principal islands, Guam, Rota, and Tinian, are said to have contained above fifty thousand people; but Tinian hath, since that time, been intirely depopulated, and only two or three hundred Indians left at Rota to cultivate rice for the island of Guam, which can alone be properly said to be inhabited. This island is the only settlement of the Spaniards: here they keep a governor and garrison; and here the Manila ship generally touches for refreshment in her passage, from Acapulco to the Philippines.

Guam is computed to be about thirty leagues in circumference, and is full of hills, dales, and streams of good water. It produces the bread-fruit, cocoa-nut, and other fruit natural to the soil and climate; besides oranges, lemons, citrons, with musk and water melons, which were originally brought thither by the Spaniards. Captain Woodes Rogers observes, that the indigo plant grows wild there in such abundance, that were they industrious they might make great quantities of that valuable article of commerce;

commerce; but as they have so remote a situation, and are out of the way of trade, they make no use of it.

They have plenty of cattle, but they are lean and small, and generally white. The hogs, from their feeding almost entirely on cocoa-nuts and bread-fruit, make excellent pork; and were not the Spaniards remarkably slothful, they might enjoy almost all the delicacies and superfluities of life.

This island contains near four thousand inhabitants, one thousand of which are supposed to live in the city of San Ignacio de Agaña, where the governor usually resides. The houses are built of stone and timber, and covered with tiles, an unusual method of building in these warm climates. This island also hath thirteen or fourteen villages. The original natives are tall, strong, and of an olive complexion; they go naked, except wearing a cloth before, and the women a small petticoat. The men are very dexterous at flinging, and make use of pieces of clay of an oval form which they burn till it is as hard as marble. They are such excellent marksmen that they seldom miss hitting any mark, and throw with such force as to kill a man at a considerable distance.

As Guam is esteemed a place of consequence on account of its affording refreshments to the Manila ship, there are two castles on the sea-shore; one is the castle of St. Angelo, which lies near the road where the Manila ship usually anchors, and is but an insignificant fortress, mounting only five eight-pounders: the other is the castle of St. Lewis, which is four leagues to the north-east of St. Angelo, and is intended to protect a road where a small vessel anchors that arrives every year from Manila. This fort mounts the same number of guns as the former. Besides these, there is a battery of five pieces of cannon on an eminence near the sea-shore. The Spanish troops employed at this island consist of three companies of foot, of between forty and fifty men each. This is the principal strength on which the governor depends, for he cannot rely on the assistance of the Indian inhabitants, with whom he is generally upon ill terms, and is so much afraid of them, that he has debarred them the use both of fire-arms and lances.

The rest of the islands, though uninhabited, abound in provisions and refreshments, but there is no good harbour or road amongst them all.

The original natives are a bold, strong, and well limbed people, and seem, from some of their works, to be no ways defective in understanding, for their flying proas, which are the only vessels that for ages past have been used by them, are so extraordinary an invention, that it would do honour to the most ingenious nation.

This vessel received the name of flying proa from the swiftness with which it sails, it being able to run with a brisk trade-wind near twenty miles an hour, and the Spaniards say much more. Its construction is contrary to the practice of all the rest of mankind, for as the head of the vessel is usually made different from the stern, and the two sides alike, the proa, on the contrary, has her head and stern exactly alike; but her sides very different; for that intended to be always the lee-side is flat while the wind-ward side is built rounding like other vessels: but to prevent her oversetting, which from her small breadth, and the straightness of her leeward side, would without this precaution infallibly happen, a frame is laid out from her to windward, to the end of which is fastened a log formed in the shape of a small boat, and made hollow. The weight of the frame is intended to balance the proa, and the small boat, which is always in the water, to prevent her oversetting to windward. This frame is usually called an out-rigger. The body of the proa is formed of two pieces joined end-ways, and sewed together with bark, for no iron is used in her construction: she is about two inches thick at the bottom, which at the gunwale is reduced to less than one.

The proa generally carries six or seven Indians, two of which are placed in the head and stern, who alternately steer the vessel with a paddle according to the tack she goes on; he in the stern being the steersman. The others are employed either in bailing out the water, which she accidentally ships, or in setting and trimming the sail.

From this description it is sufficiently obvious how well they are fitted for ranging the Ladrone islands, since as they are nearly north and south of each other, and are within the limits of the trade wind, the proas by sailing most excellently on a wind, and with either end foremost can run from one of these islands to the other, and back again, only by shifting the sail without ever putting about, and by the flatness of their lee-side, and their small breadth, are capable of lying much nearer the wind than any other vessel yet known.

Vessels bearing some distant resemblance to these are to be met with in various parts of the East-Indies; but none of them seem worthy to be compared with those of the Ladrone, either for their construction or celerity, which renders it probable that this was originally the invention of some genius of these islands, and afterwards imperfectly copied by the neighbouring nations.

SECT. II.

Of TINIAN.

Its Situation and Extent. The beautiful Appearance of the Country. The Animals and Vegetables, with a particular Description of the Bread fruit. The principal Inconveniences of the Island, and by what means this beautiful Spot became depopulated.

THE island of Tinian is situated in fifteen degrees, eight minutes north latitude; and in one hundred and fourteen degrees, fifty minutes west longitude from Acapulco. It is only about twelve miles long, and about half as much in breadth, yet, on account of its extraordinary beauty and fertility, it well deserves a particular description. The soil is every where dry and healthy, and being also somewhat sandy, it is the less disposed to a rank and too luxuriant vegetation. Hence the meadows and bottoms of the woods are much nearer and smoother than is customary in hot climates. The land rises in gentle slopes from the sea-shore to the middle of the island, tho' the general course of its ascent is frequently interrupted by vallies of an easy descent, many of which wind irregularly through the country. These vales and the gradual swellings of the ground, which their different combinations give rise to, are most beautifully diversified by the mutual encroachments of woods and lawns, which coast each other, and traverse the island in large tracts. The woods consist of tall and spreading trees, most of them celebrated either for their beauty or their fruit; while the lawns are usually of a considerable breadth. Their turf is clean and uniform, it being composed of a fine trefoil, intermixed with a variety of flowers. The woods are in many places open, and free from all bushes and underwood, and the neatness of the adjacent turf is frequently extended to a considerable distance under the hollow shade formed by the trees.

Hence arises a multitude of the most elegant and entertaining prospects, according to the different blendings of these woods and lawns, and their various intersections with each other, as they spread themselves differently through the vallies, and over the slopes and declivities, in which the place abounds.

There are, however, no streams, yet the water of the wells and springs, which are every where to be met with near the surface, is extremely good, and near the center of the island are two or three pieces of excellent water, the turf of whose banks is as clear, as even, and as regularly disposed, as if they had been basins formed for the decoration of the place. These waters abound with duck, teal, and curlew: and in the island is prodigious plenty of the whistling plover.

The beauties of Tinian are not solely confined to the excellency of its landscapes, since the animals, which, during the greatest part of the year, are the sole possessors of this happy soil, in some measure partake of the romantic cast of the island, and are no small addition to its wonderful scenery; for the cattle, of which it is not uncommon to see herds of some thousands feeding together in a large meadow, are all of them milk white, except their ears, which are generally black or brown, and notwithstanding

standing there being no inhabitants, yet the clamour and frequent parading of domestic poultry, which in great numbers range the woods, continually excite the idea of the neighbourhood of farms and villages, and contribute to the cheerfulness and beauty of the place.

The cattle, which are computed at least to be ten thousand, are far from being shy; they are extremely well tasted, and the flesh of an easy digestion. The fowls too are exceeding good, and easily run down. There are also abundance of wild hogs. These are very excellent food, but they are a very fierce animal, and can only be obtained by shooting them, or hunting them with dogs. The country is equally to be admired on account of its fruits and vegetable productions, which are happily adapted to the cure of the sea-scurvy, which is of the greater advantage, as these islands are on the borders of the vast eastern ocean, and are extremely convenient for landing after a tedious voyage, which is seldom made without many of the crew suffering by that dreadful disease. In the woods are inconceivable quantities of cocoa-nuts, with the cabbages growing on the same tree. There are besides guavas, limes, sweet and sour oranges, and a kind of fruit peculiar to these islands, called by the Indians rhu-may, and by commodore Anson's people the bread-fruit; for they constantly eat it during their stay upon the island instead of bread, and it was so universally preferred to it, that no ships bread was expended all the while they staid there.

It grows upon a pretty lofty tree, which, near the top, is divided into large and spreading branches; the leaves, which are of a remarkable deep green, are notched about the edges, and are generally from a foot to eighteen inches in length. The fruit itself is found indifferently in all parts of the branches, and is in shape rather elliptical than round: it is covered with a rough rind; and is usually seven or eight inches long; each grows singly, and not in clusters. The fruit is fittest to be used when full grown, but still green; when, being roasted in the embers, it has some distant resemblance to the taste of an artichoke's bottom, and is, like that, of a soft and spongy texture. As it ripens it becomes softer, turns yellow, and contracts a luscious taste and an agreeable smell, not unlike a ripe peach, but it is then esteemed unwholesome, and is said to produce fluxes.

Mr. Dampier says, that it is as large as a two-penny loaf, and that the inside is soft, tender, white, and crummy like bread; and, if eaten in twenty-four hours after it is plucked, has a sweet and agreeable taste, and that this extraordinary fruit is in season eight months in the year.

All the advantages that have been mentioned, with respect to this delightful island are greatly enhanced by the healthiness of its climate, by the almost constant breezes that prevail there, and by the frequent showers that fall; for these, instead of the heavy continued rains, which in some countries render a great part of the year very disagreeable, are usually of a short and almost momentary duration: hence they are extremely grateful and refreshing, and are perhaps one cause of the salubrity of the air, and the extraordinary influence it had upon the men belonging to the Centurion, in increasing and invigorating their appetites and digestion. This effect was extremely remarkable, since those among the officers who were accustomed to spare and temperate diet, and besides a slight breakfast used to make but one moderate meal a-day, were here, to appearance, transformed into gluttons; for, instead of one meal of flesh, they were scarcely satisfied with three, and each of them too so prodigious in quantity, as would at another time produce a surfeit. Yet their digestions so well corresponded with the keenness of their appetites, that they were neither disordered nor even loaded by this uncommon repletion; for having, according to their custom, while on the island, made a hearty breakfast of beef, it was not long before they began to consider the approach of dinner as a very desirable, though somewhat tardy incident.

The principal inconvenience attending the island is the vast number of muschatoes and other species of flies, together with a kind of tick, which, though principally attached to the cattle, will frequently fasten on the limbs and bodies of the human species, and, if not perceived and removed in time, will bury its head under the skin and raise a painful inflammation. There are also a few centipedes and scorpions, but none of Commodore Anson's men received the least injury from them. Another inconvenience attending the island is the little security, in some seasons, for a ship at anchor, the road being extremely inconvenient.

The only proper anchoring place for ships of burthen is at the south-west end of the island, but the anchorage is very unsafe.

However, it must appear very surprising that an island so richly furnished with the conveniences of life, and so well provided not only for the subsistence, but for the enjoyment of mankind, should be entirely destitute of inhabitants, especially as it is in the neighbourhood of other islands, that in some measure depend upon this for their support. But Mr. Walter observes, that he was told by the Indians, it was not then fifty years since the island was depopulated. The three islands of Tinian, Rota, and Guam, were all full of inhabitants, and Tinian alone contained 30,000; but sickness raging among the islands, and destroying multitudes of the people, the Spaniards, to recruit their numbers at Guam, which were extremely diminished by the mortality, ordered all the inhabitants of Tinian thither, where, languishing for their native spot, the greatest part of them in a few years died of grief.

There are still remains to be met with in the island, which shew that it was once extremely populous, for in all parts of it are ruins of a particular kind; these usually consist of two rows of pyramidal pillars, each pillar being about six feet from the next, and the distance between the rows about twelve feet: these pillars are about five feet square at the base, and about thirteen feet high; and on the top of each is a semi-globe with the flat surface upwards. The whole of the pillar and semi-globe is solid, being composed of sand and stone cemented together and plastered over. These were said by the neighbouring Indians to be foundations of particular buildings set apart for only those of the natives who had engaged in some religious vow. But if they were originally the bases of their common dwelling-houses, their number must have been very considerable; for in many parts of the island they are planted very thick, and sufficiently evince the multitude of its former inhabitants.

Before we conclude this chapter, it will be proper to observe, that the ingenious writer of commodore Anson's Voyage says, that though the Ladrões have no immediate intercourse with any other people, yet there lie to the south and south-west of them a multitude of lands that are supposed to extend to the coast of that part of a new-discovered continent, called New Guinea. These islands are so near the Ladrões, that canoes from them have sometimes, by distress, been driven to Guam; whence it is very natural for us to suppose, that the Ladrões were originally peopled from the southern continent, a very small part of which has yet been discovered, and that in a very imperfect manner. This continent is thought to extend from New Holland and New Guinea through the far greatest part of the Eastern or Pacific Ocean; and very strong and convincing reasons have been given for this supposition; but it would be very inconsistent with that order which ought to be observed in a work of this kind to treat of a very different part of the earth, when our subject is only Asia and the Asiatic islands, we shall therefore defer a particular consideration of the discoveries made on that continent, till having almost encompassed the globe, we draw near the conclusion of this work, and shall therefore now proceed to the Philippine islands.

C H A P. VIII.

Of the PHILIPPINES.

S E C T. I.

Of the New PHILIPPINES.

The Dress, Customs, and Manners of the Inhabitants. There are some Reasons to suspect the Truth of the Accounts given of these Islands.

THE New Philippines, or Caroline Islands, said to be situated between the sixth and one hundred and thirty-eighth degree of north latitude, are but imperfectly discovered. The best if not the only account we have of them, is to be found in the Philosophical Transactions, in two letters from Father Clan and Father Gobien, dated from the island of Manila, founded on the report of some natives of those islands, driven upon the isle of Samar, in 1696.

These are said to consist of thirty-two islands, situated between the Ladrones and the Philippines. The country is extremely populous, and all the islands are under the dominion of one king, who keeps his court in the isle of Lomaree. The natives go half naked, and the men paint and stain their bodies with several figures; but the women and children are not painted. In the complexion and form of their faces they nearly resemble the tawny Philippines. The dress of the men only consists in a cloth fastened round their loins which covers their thighs, and a loose cloth about their bodies which they tie before. The principal difference between the dress of the men and women is, that the cloth worn by the latter hangs a little lower; besides, the most considerable among the women wear necklaces, bracelets, and rings of tortoise shell.

The people are said to be of so peaceful a disposition, that they never do violence to each other; and that murder or homicide was never heard of amongst them. Their language is different both from that of the Philippines and the Ladrone islands, and comes nearest to that of the Arabs. They are said to have no cattle, dogs, nor any quadrupeds in their islands, nor any land-fowls but cocks and hens, which they breed up, but never eat their eggs. Without observing set meals, they eat and drink when they have an appetite. They salute a person by taking him either by the hand or foot, or gently stroaking his face. Their lances or darts are pointed with sharp bones. Among their tools they have a saw made of a large shell, sharpened with a stone, for they are said to have no iron or other metals on their islands.

After all, there is some reason to believe these accounts fictitious, since we find no notice taken of them by later discoverers; and there are even some contradictions in the accounts given by those missionaries themselves; for Father Gobien says, these islands are eighty-seven in number, and form one of the finest archipelagoes in the east. He also gives a map of them, which is likewise inserted in the Philosophical Transactions, in which he makes them extend from two degrees south to seventeen degrees north latitude, though he had no other means of knowing their latitude, number, and situation, with respect to each other, than from some of the supposed inhabitants ranging pebbles on a table.

S E C T. II.

The Situation and Names of the principal of the Philippine Islands: the Climate and Fertility of the Soil: the Trees, Plants, and Shrubs: with a particular Account of some Species of the Palm and Plantain, and of several poisonous Herbs; and others Providence has wisely formed as Antidotes to them.

THE Philippine Islands are very numerous, some say they even amount to a thousand. They extend from the fifth degree of north latitude to the nineteenth, and from the one hundred and fourteenth degree of longitude almost to the hundred and thirtieth; and are situated

about four hundred leagues to the westward of the Ladrones, one hundred and twenty to the south of China, and two hundred east of Cochinchina. They were discovered by Magellan, and received the name of Philippines in honour of Philip II. king of Spain, in whose reign the Spaniards first planted an European colony there.

The principal of these islands are, 1. Luconia; or, as it is called by the Portuguese, Manila, from the chief town in the island. 2. Samar, or Tandago, sometimes called Philipina. 3. Masbate. 4. Mindoro. 5. Luban. 6. Paragoia, or Paragon. 7. Panay. 8. Leyta. 9. Bohol. 10. Sibu, Cibau, or Zebu. 11. Negroes Island. 12. St. John's. 13. Xolo: and 14. Mindanao.

The weather in these islands is not so excessively hot as might be expected from their being so nearly situated to the line; they being constantly refreshed by sea breezes, the winds blowing easterly one part of the year, and westerly the other. Those from the east begin in October, but are not settled till about the middle of November. This wind is accompanied with fair weather. It begins to turn to the west in May; but does not blow steadily from that quarter till June. When the wind first veers to the westward, it blows faintly, and there is one or two hurricanes in a day: but after the storm is over, the wind again shifts about to the east, and the sky becomes serene. In a little time there are several hurricanes in a day, with violent gusts of wind and loud claps of thunder; and at length they come on so thick, that the wind continues in that quarter from whence the hurricanes arise, that is out of the west, where it remains till October or November; during which time there is thick cloudy weather, violent rains, and sometimes such dreadful thunder and lightning, that the largest trees are torn up by the roots, and the rivers, overflowing their banks, drown the flat country.

The worst weather is about the latter end of July, or the beginning of August, when it is very cool and chilly: In September the wind and rain abate, and the air becomes clear; but still the morning fogs last till almost noon, when the sun shines out.

How disagreeable soever it be to have so great a part of the year tempestuous and rainy, yet there is not any country in the world that appears more beautiful; for there is here a perpetual verdure; and buds, blossoms, and fruit, are found upon the trees all the year round, not only in well cultivated gardens, but in the fields and mountains; and no soil in the world produces greater plenty of all the necessaries of life.

In some of these islands great quantities of gold are washed down from the mountains, and found mixed with the sand of the rivers. There are also found mines of other metals, and excellent loadstones.

The country abounds with a variety of fruits, one of the most valuable of which, called the santer, grows wild in the woods: it is of the size, shape, and colour of a ripe peach, and has five kernels like the seeds of an orange. The Spaniards preserve it in the same manner as quinces, and also when half ripe pickle it with vinegar. The tree resembles that of the walnut, but has large leaves that are used in medicine.

They have a fruit called magol, which is downy like a peach, and of the colour of an orange; but it is not well tasted, and is hard of digestion. The tree is as tall as a pear-tree, and has thick boughs, with leaves like those of the laurel; the wood is but little inferior to ebony.

They have also durions, mangoes, and most other Indian fruits; besides oranges of several kinds, different from those of Europe, and some of them much bigger. There are also great and small lemons, but these are generally sweet.

The most profitable trees are the palms, and in these consist the principal wealth of the great men. Of this tree are reckoned thirty species, the most valuable of which is the sago. These trees grow wild in the woods, and of the

the pith is made the sago brought to Europe, which the natives eat instead of bread four or five months in the year. The bark and wood are thin and hard, and when they cut down the tree they split it in the middle, then scrape out the pith, and beat it with a wooden pestle in a mortar; they then strain it through a cloth, pouring in water, which carries the substance of the pith through the cloth, and leaves nothing but a little husk behind. After it is strained it has a sediment, which, when the water is drawn from it, is made into cakes and baked, and proves very good bread. The sago exported into the other parts of the Indies is dried hard, in small bits no bigger than seeds, and is commonly eaten with the milk of almonds by those who are sick of the bloody flux.

The second sort of palm-trees are those which yield wine, and are generally found in salt-water marshes: the fruit resembles the date, but never comes to maturity, because as soon as it blossoms they cut off the branches, that the liquor may run into the vessels they place under them.

Another species of palm-trees, called yonba, furnishes them with a kind of wool of which are made quilts and pillows, and with a black thread of which they make cables for ships, which will last in sea-water longer than those of hemp. Of the leaves of any of the palm-trees they make hats, mats for rooms, sails for their ships, and covering for their houses.

Tamarinds are a wild fruit that grows in pods like peas; they have a sharp taste, and are frequently preserved with sugar. The tree is tall and thick, with small leaves, and the wood serves for the same uses as ebony.

In these islands there are also plenty of plantains, the leaves of which are so long and broad, that one of the fathers observes two of them will almost make a cloak. These trees are planted by the Indians about their houses, and on many accounts deserve a particular description. This tree, or shrub, is about ten feet high and three feet in circumference, and is not raised from seed but from slips and suckers taken from the old tree, which will bear within ten months after they are planted in their native soil; though they will be fifteen months if removed into other ground. The fruit is no sooner ripe than the tree decays; but many young shoots grow up and supply its place. At its first springing out of the ground it has two leaves, and when it is a foot high it has two more between the first, but a little lower; and soon after two others, and so on. By the time it is a month old, the body is near as thick as a man's arm; the uppermost leaves are about a foot long and half a foot broad, and as it increases in height the leaves grow larger; so that when it is at its full growth, the leaves are seven or eight feet long, and a foot and a half broad near the stalk, ending in a round point. The stalk of the leaf is as big as one's arm, almost round, and about a foot in length from the body of the tree to the leaf. When the tree is full grown there springs from the top a strong stem harder than any other part of the body, and about the thickness and length of a man's arm; round this stem grows the fruit in clusters, each about six or seven inches long, and thicker than one's wrist, much in the shape of a Bologna sausage. The outside, when ripe, appears soft and yellow, and within the pulp is sweet, and softer than butter; it is much of the same colour, and melts in the mouth, having neither seed nor stone. This fruit when green they often roast or boil, and eat it instead of bread; and the English in our plantations sometimes take the pulp of five or six of them and boil them in a bag like a pudding. A tolerable sweetmeat is also often made of the ripe plantains, by drying them in the sun. When the natives make drink of it they take the pulp of ten or a dozen ripe plantains, and mashing them together, pour two gallons of water upon them, and in two hours it ferments and has a head upon it like wort; and in four hours is fit to drink; but as it will not keep much above twenty-four hours, they brew it every morning. It drinks brisk and cool; but is very windy, as is also the fruit when eaten raw; but when boiled or roasted it has no ill effect. The plantain drink being set in the sun, makes very good vinegar. As the tree never bears fruit but once, that is no sooner gathered than they cut it down, which may be done with one blow of an ax; so thin is the wood that incloses the pith. Having stripped off the bark they split the body into four quarters; and,

after it is dried two or three days in the sun, the women divide it with their fingers into small threads, of which they make their cloth; but it is pretty stubborn while it is new, and soon wears out: but the poor people of Mindanao and other of the islands wear no other cloth.

The bonano-tree resembles the plantain in shape and size, but the fruit is not half so large. It is less luscious, and has a more delicate taste; and besides is oftener used in making of drink.

The cassia-tree is also found in these islands. This tree is smaller than that of the tamarinds, but has much thicker boughs; the leaves, which are of a beautiful green, are somewhat larger than those of the pear-tree, and being boiled with the blossoms in the manner of a conserve, produce the same effect as the fruit, and are less nauseous. The young fruit made into a conserve is a safe and good laxative. This fruit abounds so much in the mountains, that in May and June the inhabitants of the island of Mindanao fatten their hogs with it. Excellent ananas, or pine-apples, are also found here.

Here is also a tree named amet, from whence the natives draw water by cutting a hole in it; and also a kind of cane, which the Spaniards call vaxuco, which, if cut, yields a good draught of water; and there is happily plenty of them in the mountains, where water is most wanted. It usually creeps up to the tops of trees, winding about them like ivy; but some of them are very straight, and of these last the natives make pike and halberts.

In the mountains is timber fit for building either ships or houses; among the rest they have black ebony and iron wood, with several sorts of wood used in dyeing.

The camondog is a tree of so venomous a nature, that the fish which eat the leaves that fall into the sea speedily die; as do also the persons who eat the poisoned flesh. The natives dip the points of their darts in the liquor which, upon incision, flows from the trunk of this tree. It is said that even the shadow of it is so destructive, that no herb or grass will grow within it; and, if transplanted, it kills all the plants around it, except a small shrub, which is an antidote against it, and is always with it. A leaf of this shrub carried in a man's mouth is said to be a security against the venomous effects of the tree.

Here are also plenty of sugar-canes, and abundance of odoriferous herbs and flowers that grow without cultivation: also indigo, tobacco, and many medicinal herbs; one of which is used for the same purposes as the Turks chew opium, that is, to cheer the spirits, and render the people void of fear when they engage an enemy. Among the roots which serve for food are potatoes, of which there are several kinds; and there is such plenty of all sorts of roots fit for the kitchen, that many thousands of the natives live chiefly upon them.

Near to Cathalagan, in the isle of Samar, is a plant of surprising virtue; it resembles ivy, and twines about any tree near which it grows. The fruit, which arises from the knots and leaves, resembles in size and colour a melocoton, and has within it eight, ten, or sixteen green and yellow kernels, as big as a large hazle nut; which, when ripe, drop out of themselves. This is a powerful antidote against venomous herbs and the darts used by the natives of Macassar, Borneo, and the Philippines. The usual dose is the sixteenth part of an ounce powdered and mixed in wine or water.

These remedies against poison could no where be placed to greater advantage by the hand of the wise Creator, than in these islands, where, besides the poisonous tree already mentioned, the soil produces many venomous herbs and flowers, which in some of these islands not only kill those who taste them, but infect the air; so that many people die in the time of their blossoming.

S E C T. III.

Of the Beasts, Birds, Reptiles, and Fishes.

WITH respect to the animals, there are in some of these islands such numbers of wild buffaloes, that a good huntsman on horseback, armed with a spear, will kill ten or twenty in a day. The Spaniards take them for their skins, which they sell to the Chinese, and the flesh serves the mountaineers for their food.

The woods also abound with wild bears, deer, and goats, which last are so plentiful in one of these islands, that the Spaniards gave it the name of Cabras.

The Spaniards have imported from New Spain, China, and Japan, horses and cows, which are greatly multiplied; but the sheep they brought over soon died, which is perhaps owing to the heat of the climate, and the moisture of the earth.

There are monkeys and baboons in these islands of a monstrous size, which it is said will defend themselves if attacked by men. When no fruit is to be found in the mountains, they go down to the sea-shore to catch crabs, oysters, and other shell-fish. That the oyster may not close and catch their paws, they put a stone between the shells to prevent their shutting close. They catch crabs by putting their tail in the holes where they lie, and when the crab lays hold of it, they draw him out.

Civet cats are very numerous; as are also flying squirrels: and in the island of Leyte is a creature that has some resemblance to a mouse, only the head is of a prodigious size.

The ignana is a creature like an alligator, but the skin is purple, speckled with yellow, the tongue is cloven, and the feet is armed with claws. It devours poultry, and, though it is a land-animal, swims over rivers with great swiftness. The Indians and some Spaniards eat it, and say the flesh is not unlike that of the turtle.

There are alligators found in the lakes and in the sea near Mindanao and Xollo. There are also said to be a great number of sea-horses.

Turtles are found in these seas, some of which are very large, and are eat by the natives; and on the shore are tortoises, which are not good to eat, but the shell is much valued.

The turkeys carried by the Spaniards to the Philippines could not live, but they have a fowl called xolo, that has long legs, and is as well tasted as a turkey. They have another species of fowls called canboxa, whose legs are so short that their wings trail on the ground. They are in no want of common poultry, and besides these it is said they have a sort in which the flesh and bones are both black, but yet they are well tasted.

These islands afford several sorts of parrots and white cocatoes, that are something larger than a parrot, and have their heads adorned with a tuft of feathers: in some of the islands are abundance of peacocks, but pheasants and partridges are unknown; there are however heath-cocks, quails, and other game.

The tavan is a black sea-fowl, something less than a hen, and has a long neck. These birds lay their eggs in the sand by the sea-shore, each placing forty or fifty in a trench, and then covering them till they are hatched by the heat of the sand. They are as large as goose eggs; and when the chickens are hatched, the yolk appears whole and sweet, and on them the chickens feed till they have strength to break through the sand. People go in search of these nests, and wherever they find the sand thrown up, they open it, and sometimes find eggs, and at others young chickens, both of which are esteemed very good food.

The herrero is a green bird, of the size of a hen, and has so large and hard a beak, that it will make a hole in the trunk of a tree and build its nest in it. From the noise it makes when at this work, the Spaniards give it the name of herrero, or carpenter.

There are a kind of turtle-doves, grey on the back, and white on the breast; in the middle of which is a red spot, not unlike a wound with the fresh blood upon it. They have a bird called colin, of the size of a black-bird, but distinguished by ash-colour and black feathers; besides, the head is bald, and has a crown of flesh.

The last we shall mention is the saligan, which builds her nest on the sides of rocks, as the swallows do against the walls, and these make the delicious bird's nests so much esteemed.

These islands likewise produce a multitude of snakes, some of them of a prodigious size, and others exceeding venomous. It is usual for snakes to come into the houses, and even into the ships.

There are likewise several kinds of venomous insects; as scorpions whose sting is in their tails, which turn up in a ring upon their backs; and centipedes four or five inches

long, red on the back, and about as thick as a goose quill; they have a multitude of feet, which extend from the head to the tail, from whence they have their name. Their bite is esteemed more dangerous than the sting of a scorpion. These are often found among dry timber, and in old houses.

They have great plenty of fish about these islands, particularly bonetoes, cavallies, breams, and mullets.

SECT. IV.

Of the different People who inhabit these Islands, their Persons, Habits, Food, Liquors, Diversions, Arms; their Genius and Temper; their Marriages, the Names they give their Children, and their Funerals; their Religion and Superstition.

THESE islands are inhabited by four or five different nations, as the Blacks, who dwell in the woods, mountains, and most inaccessible places: the posterity of the Chinese, who once possessed part of the sea-coast: the Malayan Moors, or Mahometans, who came thither from Malacca, Sumatra, Borneo, and Macassar; the Spaniards, Portuguese, and other Europeans; and a mixed breed compounded of all these.

The Blacks were probably the first inhabitants, since they possess all the inland parts, and may have been driven into the woods and mountains by the other nations which now possess the sea-coast. These Blacks have as regular and well proportioned features as any European, and have long black hair. All the natives of these islands are of a middle stature, and well shaped. The women tie up their hair in a roll on the hinder part of the head, adorning it with jewels, or something else that makes a glittering shew; and they have also necklaces and ear-rings, with bracelets on their arms and legs, and rings on their fingers; the more civilized who live among the Spaniards wear a kind of waistcoat and a cloth about them which reaches below their knees, and many of them conform entirely to the Spanish fashions. The Blacks who live in the mountains have only a cloth about their loins, and the meaner sort of the people generally wear neither shoes nor stockings. The Chinese dress after the manner of their country, which has already been described.

It ought not to be omitted, that one of the tawny nations who inhabit these islands paint and stain their bodies like our ancient Britons and Picts, and from thence have obtained the name of Pintadoes.

The natives who dwell on the sea coast fit cross-legged like most of the other Asiatics, both at their meals and at all other times. Their usual food is boiled rice and fish, and they seldom eat flesh but at their festivals. Their common drink is hot water, and they have also palm-wine and toddy drawn from the palm and cocoa-trees, and from both they distil a spirit that resembles arrack. This last spirituous liquor they also make from rice. They have also a liquor called chiliam, which is the juice of the sugar-cane boiled in water.

Those who dwell on the mountains live chiefly on fruit, roots, and the flesh of wild beasts which they take in hunting; for they are not acquainted with husbandry, and never apply themselves to sowing rice, or any other grain.

Those Spaniards who keep good tables generally eat flesh at noon, and fish at night. The natives who inhabit the sea-coast have plays, music, and dancing, like the Chinese. In their songs one of them sings a verse, and another repeats it to the sound of a gong or metal drum. Their dancing has a martial appearance, and seems in imitation of a battle. All their motions are regular, sometimes they assault each other with their spears, and then retire very gracefully; but their greatest diversion is cock-fighting.

They are expert swimmers, and very fond of bathing, which they constantly practise both in the morning and evening, and this may be one of the reasons why the natives build their houses on the banks of rivers; even lying-in women and children newly born are constantly plunged into cold water. Both the men and women are fond of smoking tobacco, and of chewing betel and areca.

The arms of the natives are bows and arrows; and a lance headed with iron or wood hardened in the fire; they have also broad two-edged daggers and canes, thro' which they blow little poisoned darts, which have such an effect, that the slightest wound given by them are mortal, if a proper remedy be not immediately applied. They have also a long narrow shield, a kind of helmet and a guard for the back and breast, made of cane covered with a buffaloe's hide, as a defence against the poisoned darts.

The Blacks of the mountains are so fond of liberty, that they could never be brought to submit to the government of the Spaniards, to whom they are such enemies, that if they happen to kill one of them, they invite all their family to rejoice for three days successively; and, while the entertainment lasts, 'tis said they constantly drink out of his skull. On the other hand, the Spaniards make slaves of all the Blacks that fall into their hands. But, though the Spaniards have no immediate commerce with these mountaineers, they have some intercourse with them by means of the Indian nations, who dwell in the plains; for to them Spaniards sell tobacco, and several other commodities, which the Blacks purchase of them by giving gold dust, bees wax, &c. in exchange.

With respect to their marriages, the husband pays a sum of money to the father, or nearest relation, to purchase his wife. They both eat out of one dish, to shew they are to run the same fortune and partake of the same joys and sorrows; and having sacrificed some beast, an entertainment begins, and completes the ceremony. They not only marry in their own tribes, but elpouse the nearest of their kindred, except in the first degree. Divorces are allowed on both sides; but among some of them polygamy is not permitted, except the wife prove barren. Other of the Indian nations allow two or more wives.

Some of the Indians in these islands have no other marriage ceremonies than joining of hands before their parents and friends; but in those parts of the country subject to the Mahometans a plurality of women is allowed.

The mothers give names to their children, and this is commonly done from some circumstance of their birth; as for instance, Malaccas, which signifies strong, from its appearing so when brought into the world: Malivag, or difficult, because of the difficulty of the labour; but at other times they give it the name of the first thing that occurs, as Dama, the name of an herb; and by this they are known afterwards. What appears very singular is, that the first son or daughter, on being married, give their name to their parents, as Amani Malaccas, Immani Malivag; that is, the father of Malaccas, the mother of Malivag.

When a person of distinction dies, strangers are hired to come and mourn, and to lament in their songs the departure of the deceased. The body, being washed and perfumed with benjamin and other fragrant gums, is wrapt up in silk, according to his quality, and put into a coffin made so close as to keep out the air; then being placed upon a table, the cloaths and arms of the deceased are laid in a chest by the coffin; and if it be a woman, the utensils necessary for her work: food is also set before the corpse. At length the body is interred in the burying-place of the family, and a feast made for those invited to the funeral; but the widows and children for some time abstain from animal food and live only on rice and herbs. Some of these nations mourn in black, and others in white, shaving their heads and eye-brows; and formerly when a great man died, the neighbourhood were obliged for several days to keep silence. Sacrifices are offered to those who die in defence of their country.

The original natives are so extremely superstitious, that there is scarce a rock, stone, promontory, or river to which they do not pay a kind of religious worship; and they have such a veneration for old trees, that they think it a kind of sacrilege to cut them down on any account whatsoever. They have also the same veneration for some ancient tall canes, from the belief that the souls of their ancestors dwell in them, and that the cutting of those trees or canes would put them to pain.

Antiently they worshipped their idols in certain caves, and there the priests offered their sacrifices. On these occasions a young and beautiful virgin gave the first stroke to the victim with a spear, after which it was slain, cut in pieces, dressed, and eat in a reverential manner. The

missionaries say they are so superstitious, that if a snake be found on their cloaths they will never wear them again; and if they are going out on the most important business, if a snake crosses the way they will defer it, and immediately return home.

SECT. IV.

Of the Island of MINDANAO.

Its Situation, Extent, and different Nations. The Persons, Dress, Food, Customs, and Manners of the Mindanayans.

IN describing these islands we shall begin with the south and proceed to the north, treating last of Manila. Mindanao is the largest of all the Philippines, except Manila, it being sixty leagues in length, and between forty and fifty over. It has several fine harbours and navigable rivers, which are plentifully supplied with fish. The south-west part of it is situated in about the sixth degree of north latitude, and the north-east part in about the eighth.

The seas and rivers about this island are attended with an inconvenience that is of the utmost prejudice to commerce; for they are so infested with worms, that they will destroy a ship in a very short time; and therefore the natives, whenever they come from sea, immediately haul their ships upon dry land, as they do their canoes and barges, and never suffer them to lie long in the water. These worms are chiefly in the bays, creeks, and mouths of rivers; or in places near the shore.

The greatest part of the inhabitants are Mahometans, and subject to the sultan of Mindanao, who governs arbitrarily and without any written laws. His subjects who dwell near the coasts are called Mindanayans, and have the greatest commerce with strangers: for the whole island is not subject to this prince, nor is either the religion or language the same in every part of it. Those who live in the woods and mountains in the midst of the country are called Hilanoons, and have rich mines of gold and great plenty of bees-wax, which they exchange with the Mindanayans for cloaths and other necessaries.

The Sologues are the least nation that inhabit this island. They are planted on the north-west part of it, and have little commerce with the Mindanayans, though they carry on a considerable trade to Manila and the neighbouring islands.

The Mindanayan men have little heads and oval faces, with small black eyes; their foreheads are flat, their noses short, their mouths wide, their lips are red and thin, their hair black and straight, and, as in other parts of India, they black their teeth. They are of a tawny complexion, but of a brighter colour than some of their neighbours; their limbs are small, and their bodies straight; they wear their nails to a great length, especially that of the left thumb, which they never cut but scrape and nourish it with great industry. They have a stately mien, but are civil to strangers, and entertain them with great familiarity, except they are insulted or injured, and then they are implacable in their revenge, which they execute secretly by poison or assassination.

They wear a kind of linen shirt, which scarcely reaches down to their knees, and a pair of drawers, but have neither shoes nor stockings. They wear a small turban on their heads, which is tied once round, and the ends, which are fringed, hang down.

The features of the women are something more agreeable than those of the men, but their noses are too small; they have long black hair, which they tie up in a roll on the back part of the head, and their faces are rounder than those of the men: their complexion is also somewhat more agreeable. They wear a short frock, or a shirt like the men, but the sleeves are a great deal wider than their arms; but so straight at the wrist, that they can hardly get their hands through. They have also a short petticoat or a piece of cloth wrapt once round their waist. The common people wear cloaths made of the plantain-tree, but those in better circumstances are clothed in silk and callicoe. They have small feet, but, like the men, wear neither shoes nor stockings, though they have rings on their fingers, and bracelets of gold or silver on their wrists.

The

The Mindanayans are said to be an ingenious and witty people. They can be active enough when they please, but are generally lazy, and will seldom work unless they are compelled to it by hunger, which is chiefly attributed to the tyranny of the prince, who will not permit them to enjoy the wealth they acquire.

The women are allowed to converse with foreigners, and to entertain them with innocent gallantry at their houses. When any foreigners arrive at Mindanao it is customary for the men to go on board and enquire if any of the ship's company choose a comrade, or a pagally: by a comrade is meant a male friend, and by a pagally one of the other sex. Almost every stranger is under a necessity of contracting such an acquaintance, and when he comes on shore is welcomed to his comrade's or pagally's house, where he eats, drinks, and sleep; but for this his host expects to be paid, and seldom makes any other present gratis but tobacco or betel. Persons of the best quality allow their wives the freedom of conversing with their pagallys in publick.

The common people live principally on rice, sago, and small fish; while those in better circumstances eat buffaloe beef and fowls with their rice, but their cookery is very indifferent. As they use no spoons, they take a handful of rice out of the dish, which they squeeze together and put into their mouths. They always wash after their meals, and after touching any thing they esteem unclean. They have a pretty strong liquor made of rice steeped in water, and with this they will be very merry; but when they invite foreigners, they do not choose to drink out of the same vessel, for fear they should be defiled by the touch.

On days of rejoicing they have women bred to singing and dancing, who perform before them; but they have no instruments of music. These dancers do not leap from the ground, but shew the suppleness of their limbs by the odd postures they twist themselves into, so that one would hardly believe they have any bones in their flesh. At these entertainments they introduce a single man, who seems to act the part of a hero, and putting on a dreadful look strides across the room with his lance in one hand, and a great broad sword in the other; and, having traversed it several times in a menacing manner, throws his lance and draws his dagger, then cuts and slashes the air, till at length, seeming to have brought his enemy down, he gives two or three blows with his broad sword on the floor, as if he was cutting off his head. He then withdraws, and is succeeded by another. Their generals and great men sometimes exhibit these mock battles; and if the sultan be present he frequently concludes this kind of play by behaving as if he was really encountering a dangerous enemy.

They hunt buffaloes, wild cows, deer, and other animals; and frequently take their women with them to partake of their sport. As they have no dogs, they are but little used to firelocks; their hunting only consists in driving the game into a strong fence prepared for that purpose.

SECTION VI.

A Description of the City of Mindanao; the Sultan's Palace; the Trade of the Mindanayans; their Schools, mechanic Arts, and Religion.

THE city of Mindanao, which is the chief town in the island, is situated in about the sixth degree of north latitude, on the banks of a small river about two miles from the sea. It is about a mile in length, but is narrow, though it has some houses on the opposite shore. This city is not well situated for commerce, for there is a bar at the mouth of the river, which at a spring-tide has not above ten or eleven feet water; so that large ships cannot easily come up to the city.

The houses of Mindanao are built on posts between fourteen and twenty feet above ground, and have but one floor, which is divided into several rooms; and to these they ascend by means of a ladder. Their building in this manner is extremely necessary, because their towns being situated in the plains by the sides of rivers, would other-

wise be destroyed, as these rivers annually overflow their banks to a very great height. Their buildings, however, are very slight; their walls and floors being made of split cane and bamboo, and their roofs covered with palmeto leaves. Underneath their rooms the people keep their ducks and poultry, and make their dunghills, on which account they are not very sweet, except at the time of the inundation.

The sultan's palace is very lofty and spacious, for it stands on one hundred and eighty pillars, and is much higher than the common buildings; a broad stair-case leads up to it, and in the first room are twenty iron cannon mounted upon carriages. Several of the grandees have also great guns in their houses. The floors of the rooms are neatly matted, on account of their sitting cross-legged upon them, for they use no chairs.

At a small distance from the sultan's palace is a house erected for the reception of ambassadors and foreign merchants, which is also used for a council-chamber.

They build serviceable ships, and vessels both for trade and pleasure, and have also some ships of war. They chiefly trade to Manila, to which they export gold and bees-wax; and in return bring back calicoes, muslins, and China silks. They also carry on a trade with the island of Borneo, and the Dutch come thither in sloops from Ternate and Tidore to purchase rice, bees-wax, and tobacco; for the last grows more plentifully at Mindanao than in any other island except Manila, and is an excellent sort, but the people have not the art of managing it to advantage like the Spaniards at Manila. The tobacco at Mindanao is of a deeper colour than that of Manila, and the leaf much larger, which is imputed to the fatness of the soil. The Manila tobacco is of a bright yellow, and the leaf, which is of a moderate size, is not strong, but very pleasant to smoke. The people of that island, by well ordering of it, sell it all over India at a very high price; while that of Mindanao, which is said to be really as good, is sold exceeding cheap.

Mindanao gold is valued at fourteen Spanish dollars the English ounce, and eighteen dollars the Mindanao ounce, for Spanish dollars are the current coin of all these islands.

In the city of Mindanao they speak two languages, the one the proper language of the island, and the other the Malayan tongue, which is spoken in all the oriental islands, and in several countries on the continent, as at Cochinchina, Cambodia, and Malacca.

In that city are several schools, in which children are taught to read and write; and it is observable, that many of their words, especially in their devotions, are Arabic, and some of their forms of salutations are in the Turkish language. As the Mindanayans do not understand accounts, they employ the Chinese, who live among them, when they have any to settle with foreigners. There are but few handicrafts in the city of Mindanao, where the chief trades are the goldsmiths, blacksmiths, and carpenters. The blacksmiths, considering their tools, are excellent workmen; they have neither anvil, vice, or hammer, but a great stone or piece of an old gun to hammer upon; and in this manner they not only make common utensils, but all iron-work for ships tolerably well. Almost every man is a carpenter, and can use the ax and adze; and as they have no saws, they split all their planks, and then smooth them with these tools; but, though this requires great labour, they work cheap.

The Mindanayans are frequently afflicted with a kind of leprosy, or dry scurf, which spreads all over the body, and produces an intolerable itching; for which reason they are perpetually scratching themselves. However, they do not seem to be under any great fear of catching this loathsome disease, and never refrain from each others company on that account. Their other distempers are the fever, small-pox, and flux; the latter of which occasions great pains in the bowels.

The Malaysians are of the Mahometan religion, and the inhabitants of the inland country are pagans.

The people of Mindanao, like other Mahometans, allow several wives and concubines, and the sultan has about thirty, with whom he chiefly spends his time; but the married women here are not so closely confined as in other places where the doctrines of Mahomet prevail, but are suffered

suffered not only to walk the streets, but freely to converse with strangers. As their religion prohibits their eating swine's flesh, the wild hogs multiply extremely, and even come down from the woods into the towns, searching under their houses for food; while the people dare not kill them for fear of being defiled by their touch, but are very glad when the Europeans will do it for them. Yet they will not suffer an European to come near them immediately after he has touched hog's flesh.

S E C T. VII.

Of the Sultan of Mindanao, the Manner in which he goes abroad, and a Description of the Barge in which he takes his Pleasure by Water; with an Account of the Government of that Prince, and the Manner in which he makes War.

THE sultan, notwithstanding his being an absolute prince, is very poor, for the Hilaloons who inhabit the mountains possess all the gold-mines, and the country affords little else for the use of strangers, except sago, rice, tobacco, and bees-wax; and the last also comes from the woods and mountains. However, the poverty of the prince seems more owing to his tyranny and oppression, than to the want of the materials of commerce; for this puts a stop to all industry, and necessarily occasions the neglect of trade: for if the prince knows that any of his subjects have money, he immediately borrows it, and seldom makes any return.

When this prince goes abroad, he is carried on a couch or open palanquin on four men's shoulders, and is attended by eight or ten of his guards. When he takes his pleasure upon the water, he is accompanied by his women. In the middle of the barge is an apartment capable of holding fifty or sixty people: this is erected with split bamboos, about four feet high, with small windows on the sides, and the roof is neatly covered with palm-leave. This apartment consists of three rooms, one for the prince himself, the floor and sides of which are matted, and it is also furnished with a carpet and pillows for him to sleep on. The next room, which is for his women, is furnished much in the same manner; and the third is for the servants, who wait upon them with betel and tobacco, for they are always chewing the one or smoking the other. The watermen sit at the head and stern when they row the vessel.

The prince has one prime minister, to whom he commits both his civil and military affairs; and both the natives and foreigners apply to him for permission to trade. As this person is also general of the sultan's forces, the singing women who perform before him make his great actions in the field the subject of their songs.

The sultan of Mindanao is frequently at war with the mountaineers, and seldom with any other people. The weapons used by his soldiers are a lance, a sword, and a kind of short dagger. They seldom come to a general engagement, for the armies are no sooner advanced within a small distance of each other, than they begin to throw up intrenchments and redoubts. Thus they pass two or three months, sending out small parties and skirmishing every day.

S E C T. VIII.

Of the small Islands situated between Mindanao and Manila.

BEFORE we give a particular account of Manila, the largest and most valuable of all the Philippine islands, we shall describe the situation of the most considerable of the smaller islands; for as the customs and manners of the inhabitants have been already mentioned, they need not be here repeated.

Thirty leagues to the southward of Mindanao is the isle of Xolo, or Jolo, which is governed by a prince of its own. All the ships of Borneo touch here, and this may be considered as the mart of all the Moorish kingdoms of the east. It abounds in rice, and is the only island of all the Philippines that has elephants, which here multiply very fast, because the inhabitants, it is said, never take them.

A great deal of ambergris is thrown on the shore of this island.

An island named Leyto is situated to the north-east of Mindanao. It is about one hundred leagues in compass, and is divided in the middle by a mountain, which is said to occasion a great alteration in the air, it being frequently cold on one side, while it is very hot on the other.

To the west of the last mentioned island lies Sibou, or Cibou, which is about twenty leagues long, and eight broad. The chief city is Nombre de Dios, which was the first town built by the Spaniards in the Philippine islands; it is a bishop's see, and has a cathedral, and several monasteries. It had formerly a great trade, and the privilege of sending ships to New Spain; but the trade is now removed to Manila.

Bohol, an island of about forty leagues in circumference, lies to the south-west of Leyta.

To the west of Sibou lies Negroes island, in ten degrees latitude. It extends in length from north to south, and is about one hundred leagues in circumference. It takes its name from the blacks, its principal inhabitants.

Paray lies to the westward of Negroes island, in the latitude of ten degrees; it is somewhat of a triangular form, and is also one hundred leagues in compass.

Paragoia, or Paragoa, is the largest of the Philippine islands, except Manila and Mindanao. It lies to the westward of them all, and is about one hundred leagues in length, and from ten to twenty-five in breadth. The south part of the island, which lies nearest to Borneo, is governed by the king of that island, and the inhabitants are Mahometans: the north-east part of it is under the dominion of Spain; but the middle of the island is possessed by its original inhabitants.

To the north of Paragoia are three small islands, called the Calamines, famous for their edible bird-nests.

Philippina, or Samar, lies to the south-east of Manila, and is about one hundred and thirty leagues in circumference. The capital of the island is called Catbalagan, and is governed by an alcade. The north-east point forms the cape called Spirito Sancto.

Masbate lies to the westward of Samar, and also to the south of Manila, in twelve degrees north latitude, and is about thirty leagues in compass.

Mindoro lies to the westward of Masbate, in thirteen degrees latitude, and is seventy leagues in compass.

And to the northward of this last island is the small isle of Luban, which is rendered famous by its volcano.

We shall now proceed to Manila or Luconia, which is situated to the south, and being a place of the utmost importance, deserves a very particular description.

S E C T. IX.

Of LUCONIA or MANILA.

Its Situation, Extent, Rivers, and Lakes. It is subject to Earthquakes. Its Climate, and a Description of the Bay and City of Manila.

MANILA, by far the largest of all the Philippine islands, extends from thirteen degrees, thirty minutes, to nineteen degrees north latitude, and has been sometimes resembled to a bended arm. It is one hundred and sixty Spanish leagues in length; but is of very unequal breadth; it being in some places twenty, in some thirty, and in others forty leagues over.

This island abounds both in rivers and lakes, the principal of which is the lake of Bahia, which is near the city of Manila, and is about ninety miles in compass; it is long and narrow, and has great plenty of fish: but it is infested with crocodiles, that devour both the men and cattle which approach the banks. Near this great lake is a small one upon a mountain, which the natives being unable to fathom, imagine it has no bottom; but it has only some ill-tasted fish.

This island is extremely subject to earthquakes; these in 1627 levelled one of the mountains, and in 1625, a third part of the city of Manila was overthrown, and no less than three thousand persons perished in the ruins; and the following year there was another earthquake not much less dreadful.

Manila, notwithstanding its situation, is esteemed to be in general extremely healthy, and the water found upon it is said to be the best in the world. It produces all the fruits of the warm climates, and has an excellent breed of horses, supposed to be first carried thither from Spain. It is well situated both for the Indian and the Chinese trade, and the bay and port of Manila, which is on its western side, is perhaps the most remarkable on the whole globe, the bay being a circular basin near ten leagues in diameter, and great part of it entirely landlocked. On the east side of this bay stands the city of Manila. The port, peculiar to the city, is called Cabite, and lies near two leagues to the southward; and in this port all the ships employed in the Acapulco trade are usually stationed.

The city of Manila, the capital of the island, is in a healthy situation; it is well watered, and is in the neighbourhood of a very fruitful and plentiful country; but as the principal business of this place is its trade to Acapulco, it lies under some disadvantages, from the difficulty there is in getting to sea to the eastward; for the passage is among islands and through channels, where the Spaniards, by reason of their unskilfulness in marine affairs, waste much time, and are often in great danger.

This city, which is large and populous, stands at the foot of a ridge of high hills fronting the harbour. The houses are spacious, strong, and covered with tiles; and the streets large and regular, with a market place in the midst, and it has several handsome churches and convents, the principal of which are a cathedral, which is large, but not much adorned on the inside. The college of Jesuits is a great building, adorned with arches and spacious dormitories. Adjoining to it is the college of St. Joseph, which has forty collegians, who study humanity, philosophy, and divinity. The collegians are clothed in purple, and have red cloth gowns, and the graduates, by way of distinction, wear something like a collar of the same cloth.

There are also in Manila several churches, chapels, convents, and hospitals that are endowed: in the convent of the church of Misericordia, dedicated to St. Elizabeth, are received the orphan daughters of Spaniards and Mulattoes, who are born of Spanish and Indian parents: these have a portion of three or four hundred pieces of eight paid for them, and if they chuse to be nuns, they have a suitable annual allowance. The inside of their churches and chapels are extremely rich; that of St. Austin's in particular has fifteen altars richly gilt, but most of the public structures are built of wood, on account of the frequent earthquakes in these islands.

SECT. X.

Of the Government of Manila, and the Number of the People subject to Spain.

THE Spaniards have a captain-general, who keeps his court in the city of Manila. This is one of the most profitable posts under the king of Spain, and most of the grandees would be ambitious of obtaining it, were not this island at so great a distance from Europe. This officer has under him twenty-two alcaldes, or governors of towns and provinces, two of whom reside in the city of Manila: one having the government of the Europeans, and the other that of the Asiatics. There is also a tribunal of three or four judges, in which the captain-general presides, though he has no voice; for when their opinions are equal, he appoints some doctor of laws to give the casting-vote. Both these judges and the solicitor for the crown have their places for life, and cannot be turned out by the viceroy; but all military employments are in his gift, and he appoints the governors of provinces: he has likewise the nomination of the captains of the galleons which sail every year to Spain, which post is said to be worth fifty thousand crowns a year. The viceroy usually keeps a garrison of about eight hundred soldiers in the city, and has three or four thousand more under his command in other parts of the country. The pay of each man is two pieces of eight and fifty pounds of rice a month.

The captain-general is no sooner recalled, than proclamation is made for all persons within sixty days to come and exhibit their complaints against him; he then undergoes a trial, his successor being frequently his judge; and this trial being over, he is sent back to Spain, with an account of his conduct, and of the proceedings against him.

As to the ecclesiastical government, there is an archbishop at Manila elected by the king, who determines all appeals from his suffragan bishops, as well as all affairs in his own diocese: but there lies an appeal from him to the pope's delegate, who resides in one of the Philippines. The revenue of the archbishop amounts to six thousand pieces of eight per annum, which he receives from the crown; and that of the bishops of Sibuyan, Camerines, and Cagayan, five thousand. Besides, that there may be no intermission in the care of souls before a new prelate can arrive, there constantly resides at Manila a titular bishop, or coadjutor, who assists in the first vacant church. There is also a court of inquisition at Manila, under the conduct of a principal inquisitor appointed by the court of inquisition at Mexico.

The Chinese had formerly the dominion of great part of the sea-coast, and it is said three or four thousand of their descendants still remain in this island; and being the only mechanics and artisans of the country, the Spaniards are unable to do without them, and therefore suffer them to profess their religion at Manila, which is a favour they do not usually grant in their colonies. These have however an alcalde and other Spanish officers appointed over them, whose salary they are obliged to pay; and, besides other duties and taxes to the crown of Spain, they are said to pay no less than ten thousand pieces of eight per annum only for the liberty of gaming a few days at the beginning of every new year. Their usual game is called matua, which is no more than even or odd; a small heap of money being laid down, a person guesses whether the number of pieces in the heap be even or odd. If he guesses right, he wins the heap; if not, he pays as much as he would have won. The Spaniards do not permit any of the Chinese to remain in the house of a Christian in the night-time, nor after it is dark to have any light or fire in their own.

There are supposed to be in all these islands about two hundred and fifty thousand souls subject to the king of Spain, and yet it is computed that these do not amount to the twelfth part of the people who inhabit the Philippines. Every master of a family under the government of the Spaniards pays an annual duty of ten rials, and every single man above eighteen and under sixty, pays five rials; and the said sum is said to be paid by every single virgin who is upwards of twenty-four and under fifty years of age.

As the inhabitants are a mixture of people consisting of Spaniards, Chinese, Indians, &c. their complexions are as different, consisting of white, tawny, and black. There are computed to be about three thousand souls within the walls of the city, and as many more in the Chinese suburb. There are besides other large suburbs, that consist of several Indian nations, who live near the river in houses built on wooden pillars; and beyond the suburbs, on both sides the river, gardens, farms, and country houses, extend a great way up into the country, and afford an agreeable prospect. The inhabitants of the mountains live under the shelter of great trees, or in small huts made of their branches; and when they have eaten up the fruit, and the roots proper for nourishment that are to be found near them, they remove to another place.

SECT. XI.

Of the Trade of Manila, and the Manner in which the Ships of that Island sail to Acapulco. That Island taken by the English.

MANILA, from its excellent port placed in a manner between the rich kingdoms of the East and West, was once considered as the best situation for trade in the known world, especially when the Molucca islands were under the same government; for the Spaniards had there the

the best share of the East as well as the West Indies. Hither diamonds and other precious stones were brought from Golconda; silver, from New Spain and Peru; nutmegs and cloves, from the Moluccas; cinnamon, from Ceylon; pepper, from Sumatra and Java; silks, from Bengal; camphire, from Borneo; benjamin and ivory from Cambogia; china-ware silks, from China; and formerly two or three ships came every year from Japan, freighted with silver, amber, silks, cabinets, and other japan-ware, in exchange for hides, wax, and the fruits of the country; and two vessels annually sail to Acapulco, in New Spain, loaded with the riches of the East, and returned, as they do at present, chiefly freighted with silver.

The trade carried on from Manila to China, and different parts of India, is principally for such commodities as are intended to supply the kingdoms of Mexico and Peru. These are spices, all sorts of Chinese silks and manufactures, particularly silk stockings, of which, it is said, fifty thousand pair are usually shipped in each cargo; great quantities of Indian stuffs, as chints and calicoes, with gold-smith's work, and other articles, chiefly made at the city of Manila.

All the inhabitants of Manila do not enjoy the benefit of trading to Acapulco. The ships employed in this commerce are found by the king of Spain, who pays the officers and crew, and the tonage is divided into a certain number of bales, all of the same size. These are distributed among the convents at Manila, but principally to the jesuits, as a donation to enable them to support their missions for the propagation of the catholic faith. Thus the convents have a right to embark such a quantity of goods on board the Manila ship as amount to the tonage of their bales; or if they do not choose to be immediately concerned in trade, they may sell this privilege to others; and when the merchant to whom they sell their share is unprovided with a stock, it is not uncommon for the convents to lend him considerable sums of money on bottomry.

The trade is limited by the royal edicts to a certain value, which the annual cargo ought not to exceed. This limitation is said to be six hundred thousand dollars; but it does not fall much short of three millions of dollars.

As the greatest share of the treasure returned from Acapulco is again dispersed into different parts of India, and as all European nations have generally esteemed it good policy to keep their American settlements in an immediate dependence on their mother country, without permitting them to carry on directly any gainful trade with other powers; many remonstrances have been presented to the court of Spain against this Indian trade allowed to the kingdom of Mexico. It has been urged, that the silk manufactures of Valencia, and other parts of Spain, are by this means greatly prejudiced, and the lincens carried from Cadiz much injured in their sale; since the Chinese silks coming almost directly to Acapulco can be afforded considerably cheaper there than any European manufactures of equal goodness, and the cotton from the coast of Coromandel supply the place of the European lincens. So that the Manila trade renders both Mexico and Peru too little dependant upon Spain for a supply of their necessities, and exhausts those countries of a considerable quantity of silver, the greatest part of which, were this trade prohibited, would center in Spain, either in payment for Spanish commodities, or in gains to the Spanish merchants: whereas, now the only advantage received from it is, the enriching the jesuits, and a few particular persons at the other extremity of the world. These arguments so far influenced Don Joseph Patinthe, who was formerly prime minister, and an enemy to the jesuits, that about the year 1725 he resolved to abolish this trade, and to permit no Indian commodities to be introduced into any of the Spanish ports in the West Indies, except such as were brought thither by the register ships from Europe. But the powerful intrigues of the jesuits prevented this regulation from taking place.

The trade between Manila and Acapulco is generally carried on in one, or at most two annual ships. These sail from Manila in about July, and arrive at Acapulco in December, January, or February following; and having there disposed of their effects, return for Manila in March, and

usually arrive there in June. Thus a whole year is nearly taken up in the voyage. For this reason, though one ship is only freighted at a time, yet another is always ready when that arrives. Hence there are always three or four stout ships, that in case of any accident the trade may not be suspended. The largest is described as little less than one of our first-rate men of war, and sometimes has twelve hundred men on board; and though their other ships are far inferior in bulk, yet they are stout large vessels, of the burthen of twelve hundred tons and upwards, and generally carry fifty guns, and have on board from three hundred and fifty to six hundred hands, passengers included.

For these and many other observations in relation to Manila, and the important branch of trade carried on between that city and Acapulco, we are indebted to commodore Anson's Voyage; from which we shall, for the satisfaction of the curious, give a circumstantial detail of the navigation from thence to Acapulco. The ship having received her cargo on board, and being fitted for the sea, generally weighs from the mole of Cabite about the middle of July, when the westerly monsoon sets in. Its sailing through the channel, called the Bocadero to the eastward, is so troublesome a navigation, that it is sometimes the end of August before they complete it. When they have cleared this passage, and are disentangled from the islands, they steer to the north-east till they arrive in the latitude of thirty degrees, or upwards, where they expect to meet with westerly winds, before which they stretch away for California; and never let go her anchor till she arrives on that coast. This voyage seldom takes up less time than six months, and the ship being deeply laden with merchandize, and crowded with people, it must appear surprising how they can be supplied with a stock of fresh water for so long a voyage; and this being done by a method extremely singular, it deserves to be particularly mentioned.

Their water is preserved on board, not in casks, but in earthen-jars, that almost resemble the large oil-jars we often see in Europe. When the Manila ship first puts to sea, she has on board a much greater quantity of water than can be stowed between decks, and the jars which contain it are hung all about the shrouds and stays, so as to exhibit at a distance a very odd appearance. Though these jars are much more manageable than casks, and are liable to no leakage, unless they are broken; yet a six, or even a three months store of water, could never, by any management, be stowed in a ship so loaded; and therefore, without some other supply, this navigation could not be performed: but this supply seems at first sight so extremely precarious, that it is amazing such numbers should run the hazard of perishing by the most dreadful of all deaths. In short, their only method of obtaining a fresh supply of water is by the rains they meet with between the latitudes of thirty and forty degrees north, and which they are always prepared to catch; for they take with them a great number of mats, which, whenever the rain descends, they range slopingly against the gunwale, from one end of the ship to the other, their lower edges resting on a large split bamboo; whence all the water that falls on the mats drains into the bamboos, which conveys it into the jars. However accidental this method of furnishing themselves with water may appear, it hath been never known to fail; and it is common for them, when their voyage is a little longer than usual, to fill all their jars several times over.

In 1743 commodore Anson took near this island a large Acapulco ship, in which was one million three hundred and thirteen thousand eight hundred and forty-three pieces of eight, and thirty-five thousand six hundred and eighty-two ounces of virgin silver, besides some cochineal and other commodities, which he brought to England in 1744.

Towards the conclusion of the last war, when Spain, upon the most idle pretences, joined with France to put a stop to the amazing succession of victories, with which Providence had blessed our arms, it was resolved to attack Manila. Vice-admiral Cornish and general Draper were directed to go upon this expedition: the troops allotted for the enterprize were only the seventy-ninth regiment, and a company of royal artillery; but the gentlemen of Madras furnished them with thirty of their artillery, six hundred

hundred of their seapoys, a company of caffrees, another of rapazes, and another of pioneers, with two companies of Frenchmen who had insisted in their service, and some hundred of unarmed Lafcars; to which rear-admiral Cornish added a fine battalion of five hundred and fifty seamen; and two hundred and seventy marines; the whole force for the land operations amounting to two thousand three hundred men; who, with the necessary stores, embarked on board his majesty's squadron, and two India ships employed as transports.

On the 23d of September, 1762, they anchored in Manila-bay. and the next day, having in vain summoned the city to surrender, a part of the troops landed in the evening near a church and village called Malata, about two miles to the south of Manila; while the frigates kept up a brisk fire to protect their flanks, and disperse the enemy, consisting of both horse and foot, that began to assemble, in order to oppose their descent. This had the desired effect, for they retired, and left a clear coast; but a violent surf which arose dashed many of the boats to pieces, and damaged the arms and ammunition. The English, however, having formed on the beach, marched and took possession of Malata, while the Spaniards of the city of Manila were employed in burning part of the suburbs.

On the twenty-fifth they seized the fort of Polverista, which the Spaniards had abandoned; and the same day colonel Monson, with two hundred men, took possession of the church of Hermita, about nine hundred yards from the city, and the priest's house was made the headquarters. They soon found that the monsoon had broke upon them, the rains that fell deluged the country, and made it impossible to encamp. This post was therefore of the utmost consequence, both from its strength and the great shelter it afforded, and therefore to secure it major More marched up with the seventy-ninth regiment. Then proceeding still nearer to the city, they advanced, under cover of the houses, to the church of St. Jago, which is situated near the sea, and within three hundred yards of the city.

Mean while the surf continuing dangerous, and the rains increasing, the landing of the artillery and stores was attended with great hazard, and the remaining troops were put on shore with some loss; but the courage and activity of the seamen surmounted all obstacles. The next day the Spaniards, who had before endeavoured in vain to dislodge them, took possession of a church about two hundred yards to the right of St. Jago, and began a cannonade with two field-pieces upon the right flank of the post; but a party being sent against them, they were soon driven back into the town, with such precipitation, that they left one of the field-pieces upon the glacis, and colonel Monson had orders to keep possession of this second church; for as they had neither a sufficient number of men, nor dry ground to make regular approaches, they were forced, by their critical situation, into these rash measures.

From the top of this last post they had a perfect view of the enemy's works, and found that the front they were obliged to attack was defended by the bastions of St. Diego and St. Andrew, with orillons and retired flanks, a ravelin, which covered the royal gate, a wet ditch, covered-way, and glacis. The bastions, which were in excellent order, were lined with a great number of fine brass cannon; but their ravelin was not armed, the covered-way was out of repair, the glacis was low, and the ditch not carried round the capital of the bastion of St. Diego; which determined them to attack it, and a small part of the seventy-ninth regiment, under the brave captain Fletcher, had the courage to approach the walls and found the ditch, which they found to be about thirty yards broad, and the depth of the water only five feet: while the Spaniards, firing from their bastion, killed or wounded three of these bold adventurous men.

The great extent of this populous city rendering it impossible for the besiegers to invest it, two sides were constantly open to the Spaniards, who made use of this advantage by introducing supplies of men and provisions, and the garrison of eight hundred men was augmented by ten thousand Indians, a fierce and barbarous people: but no difficulty could check the ardour of the troops,

who made fascines and gabions, opened batteries, and continued their bombardment day and night.

Mean while the governor sent a flag of truce to apologize for some barbarities committed by the savages who had murdered some straggling seamen, and to desire that his nephew, who had been taken in the bay, might be sent ashore. This request was granted, and lieutenant Fry was ordered to conduct him into the town with a flag of truce: but as that gentleman was advancing with him, a large party of the garrison, intermixed with Indians, making a folly, the barbarians, without respecting his character, inhumanly murdered him, mangling his body in a most shocking manner; and also mortally wounded a gentleman who endeavoured to save him: when it being evident that the Indians alone were guilty of this horrid piece of barbarity, our soldiers shewed them no mercy.

At length the weather grew so tempestuous, that the whole squadron was in danger, and all communication with it was cut off; while the violence of the storm forced the South-Sea-Cattle store-ship, from her anchors, and drove her ashore; but even in this situation she was of great use, by enfilading the whole sea-beach to the southward, and keeping in awe a large body of Indians, who menaced the Polverista and the English magazines at the Malata. The deluge of rain and the roaring of the wind continuing, the enemy seemed to trust entirely to the elements; while the archbishop, who acted as governor, gave out that an angel of the Lord was gone forth to destroy their enemies, like the host of Sennacherib.

But the weather no sooner became moderate, than, by the skill and management of major Parker and the officers under him, a fresh battery silenced twelve pieces of cannon on the bastion of St. Diego: yet soon after one thousand of the Indians attacked the cantonment of the seamen. This was performed on the fourth of October, three hours before day, when their approach was favoured by a multitude of thick bushes that grew upon the side of a rivulet, which they passed in the night; and, by keeping close, eluded the vigilance of the patrols. Colonel Monson and captain Fletcher, with the picquets, were sent to the assistance of the seamen, who bravely kept their posts, and were satisfied with repulsing them till day-break; though the Indians, armed with bows, arrows, and lances, advanced to the very muzzles of their pieces, and died gnawing of the bayonets; but it no sooner grew light, than a fresh picquet of the seventy-ninth regiment appearing, they fled with the loss of three hundred men.

Scarce were these Indians dispersed, when another body of them, with part of the Spanish garrison, attacked the church which the English had before taken from the Spaniards, and forcing the seapoys from their post in it, took possession of the top, from whence they killed and wounded several of our people, who were entirely exposed to all their weapons: yet the European soldiers, with great firmness and patience, maintained their post behind that structure; and at last, with the assistance of some field-pieces, dislodged the enemy.

This was the enemy's last effort: all their Indians, except eighteen hundred, discouraged by their losses, returned home: and the fire of our batteries, which had been a little interrupted by these attacks, was renewed with greater spirit than ever. A considerable breach being made, on the sixth of October, at four o'clock in the morning, the troops, to give the less suspicion, filed off in small parties, and assembled at St. Jago's church. At day-break the walls being cleared by the cannon, sixty volunteers, under lieutenant Russel, supported by a body of grenadiers, at the signal of a general discharge of the artillery and mortars, with the greatest intrepidity, rushed on to the assault, under the cover of a thick smoke, that blew directly upon the town: they were closely followed by the engineers, the pioneers, and others to clear and enlarge the breach, and make lodgments in case the enemy should be too strongly intrenched. Then advanced colonel Monson and major More, at the head of two grand divisions of the seventy-ninth, the battalion of seamen followed next, sustained by the other two divisions of the seventy-ninth, and the company's troops closed the rear. They all mounted the breach with amazing spirit and rapidity; upon which the Spaniards in the bastion dispersed so suddenly,

as to raise a suspicion that they depended on their mines. They met with little resistance, except from the guard-house over the Royal-gate, where one hundred Spaniards and Indians, boldly refusing to surrender, were put to the sword, and from the lofty houses that surround the grand square. Three hundred men were drowned in attempting to escape over the river: mean while the governor and principal officers retired to the citadel, where they were glad to surrender at discretion, and were admitted prisoners of war on their parole of honour; while all the Indians who were taken were dismissed in safety. The people and their effects were taken under his majesty's protection; and they were freely allowed to enjoy their

religion, liberties, and trade: on the other hand, the Spaniards consented to pay four millions of dollars, and to deliver up the port of Cavite and the citadel, with all the islands and forts dependent on Manila, to his majesty; with all the military stores and magazines, for the preservation of the town and their effects. The English also took several large ships, and among the rest the Santissimo Trinidad, bound for Acapulco.

But before this agreeable news had reached England, the peace was concluded, by which it was agreed, that any acquisitions made of the Philippine islands should be restored to Spain.

CHAP. VII.

Of the Island of CELEBES, or MACASSAR:

SECT. I.

Its Situation, Extent, Climate, Plants, and Animals.

TO the south of Mindanao lies the island of Celebes, or Macassar, which is called the key of the Spice Islands. It extends from one degree thirty minutes north latitude to five degrees thirty minutes south, and is situate to the east of the great island of Borneo. From the south-west point to the north-east is about five hundred miles in length, and in the broadest part it is near two hundred miles over. On the south part of the island is a bay seven or eight leagues wide, that runs forty or fifty leagues into the country; and on the east side of the island are several bays and harbours, and many small islands and shoals. The country is there low, flat, and watered by many small rivulets; but towards the north the land rises in hills.

The air is hot and moist, for the country lying under the line is subject to great rains. The time of the northern monsoons is the most healthful season; but if these fail to blow the accustomed time, which very seldom happens, great numbers of people are swept away by sickness. In the country are mines of gold, copper, and tin; but it does not appear that any great use is made of them. The gold they have is chiefly found in the sands of the rivers, and at the bottoms of the hills, where it is washed down by the torrents.

Their woods consist of the trees usually found within the tropics. They have particularly ebony, calamback, and sanders, with several sorts of wood proper for dying. The bamboos are remarkably large, some being four or five fathoms long, and about two feet in diameter: these they make use of in building their houses and boats.

Their fruits and flowers resemble those of the Philippines; but the former are said to have a more delicious flavour than the fruits of other countries exposed to floods. The plains are here covered with the cotton shrub which bears a red flower, and when that falls leaves a head about the size of a walnut, from whence the cotton is drawn; and that which grows in this island is esteemed the finest in all India.

They have pepper and sugar of their own growth, and also great plenty of betel and areca; but neither nutmegs, mace, nor cloves: though they formerly imported such quantities from the Spice Islands, that they had not only sufficient for their own use, but sold great quantities of those spices to foreigners.

Their rice is said to be better than in other parts of the East Indies, and from its goodness alone the natives are thought to be of a stronger constitution than those of the continent. This island produces great quantities of opium, which is much admired by the natives, who make it up in little pills, which they often dissolve in water, and sprinkle their tobacco with it. Those who are used to this flow

poison can never leave it off; they are lulled as it were into a pleasing dream, and intoxicated as if with strong liquor, but it insensibly preys upon their spirits and shortens their lives. When they enter into battle they put about the quantity of two pins heads of it into a pipe of tobacco; and they have no sooner smoked this pipe, than they become almost insensible of wounds or danger while the effect continues.

The natives are famous for compounding poisons from the venomous drugs and herbs produced in the country. In these fatal mixtures they dip the point of their daggers, and the darts they blow through their hollow trunks: and though these have been poisoned twenty years the fatal venom still continues, and the least wound proves mortal; and so suddenly does the poison seize the vitals, that a criminal being by way of experiment wounded in the toe by one of these little pointed darts he died, though two European surgeons, who stood by, cut off the part as soon as it was wounded.

Some of these poisonous plants so nearly resemble that which produces opium, that it is difficult to distinguish the one from the other; yet it is observed, that the cattle have such sagacity that they seldom touch a noxious herb, and if they happen to tread near one, will hastily fly from it, as if they knew better than man the danger of approaching such fatal plants.

Few countries in the world afford larger or better cattle than the island of Celebes; but there are such numbers of large monkeys, and baboons, that they are dangerous to travellers, and a man ought to be well armed in order to defend himself against them. Some of them have no tail, but others have very long ones. Some walk on fours, and others are said to walk upright like men, and never to use their fore feet but as hands. The white are as big as an English mastiff, and much more dangerous than the straw coloured, and the black; but their principal spight is said to be at women; for if they meet with one alone, they will call their companions together, and, if not prevented, strangle her and pull her into a thousand pieces. They are said to be masters of the forest, and by keeping in bodies are too hard for any of the wild beasts; but they are much afraid of the serpents, who are of a monstrous size, and continually make war upon them: it is even said they will pursue them to the very tops of the trees, and devour them. In some of these monkeys is found the bezoar stone, which is esteemed much better, and is consequently dearer than those found in goats.

They have abundance of small horses for riding, but use no other saddle, than a painted cloth without any stirrups; and a cord with a wooden bit serves them for a bridle. These horses have very bad hoofs, and are never shod, nor are they ever put to drawing, for that is solely performed by oxen and buffaloes.

There is but one considerable river in the island, and that is much infested by crocodiles.

SECT. II.

Of the Persons, Dress, Genius, Manners and Customs of Natives; the Education of their Children; their Food, and the manner in which they sit at their Meals.

THE inhabitants of this island are of a moderate stature, they are of a swarthy complexion; their cheek-bones rise very high, and their nose is generally flat, which is esteemed a beauty, and nearly as much pains is taken to flatten them in their infancy, as to make the Chinese ladies have small feet. Their hair, which is black and shining, is tied up, and when they are dressed is covered with a turban; but at other times they wear a kind of hat with small brims.

The people in affluent circumstances are clothed in a vest that reaches down to the knees, and is often made of brocaded silk or scarlet cloth with gold plate buttons; it has a straight sleeve like a waistcoat, and is buttoned at the wrist. They wear likewise a rich fash, the ends of which hang below the knees, and in it they wear their dagger, their knife and purse. The cloaths of the poor people are made of cotton. None of them wear stockings or shoes, but the quality sometimes put on a kind of slippers or sandals. They usually dye their nails red, and their teeth either red or black.

The women have shifts of fine muslin that reach down to their knees, the sleeves are as straight as a waistcoat, and come no lower than the elbows, the neck is so narrow and close, that their breasts are not seen; they also wear a kind of drawers or breeches made of silk or cotton, which sit close upon them, and reach to the middle of the leg; and the ladies of quality have their breeches knees embroidered; for they are excellent workwomen, and make their cloaths themselves. When they go abroad, they throw over their shoulders a loose linen cloth, or a piece of striped muslin, which completely covers them. They have no other head-dress but their hair tied up in a roll on the back part of the head, with some curls that fall gracefully on their necks. Their hair is perfumed and oiled, which adds to its natural blackness, and gives it a gloss. The men alone wear jewels in their hair, for the women have no other ornaments than a gold chain about their necks.

Their bodies are strong and robust, and being naturally industrious, they are ready to undergo any fatigue. They are addicted to arms, and being considered as the best soldiers on that side of India, are hired into the service of other princes and states, in the same manner as the Swiss are in Europe. They are even frequently employed by the Europeans, who have sometimes suffered for using them with too much severity, which is a treatment they cannot bear, and accordingly never fail to revenge it.

These people have excellent memories, and are so handy and quick of apprehension, that they will imitate any thing they see, and would probably become good proficients in all the arts and sciences had they good masters to instruct them. They seem inspired with just ideas of honour and friendship, and there are instances of many of them who have exposed their lives even in the defence of foreigners and Christians, and of others who have generously relieved and supported people in distress, with whom they have even shared their estates. Their love of liberty was also so strong, that they could not bear the thoughts of being enslaved by the Dutch; nor did they submit to that nation till they had long struggled in vain to preserve their freedom, and after a long and expensive war, in which almost the whole force of the Dutch in India was employed against them. They are indeed hasty and passionate; but this sudden fury is soon over, and if they are in the wrong they will readily condemn their own heat and rashness.

This is the account given of them by the English who traded to this island before it was entirely subdued: but the Dutch represent them as naturally thieves, traitors, and murderers, and add, that it is not safe for any Christian to venture, after it is dark, without the walls of the Dutch forts, or to travel at any time far into the country. Their love of liberty, and aversion to their conquerors,

may probably prompt them to commit many acts of violence, in return for the treatment they have received; but they certainly do not all deserve this character; for the Dutch themselves acknowledge, that abundance of the natives live under the protection of their forts, and being made free burghesses, carry on a considerable trade with them.

As to the women of Celebes, they appear remarkably chaste and reserved, and it is their interest to be so; for the least smile or glance at any but their husbands is thought a sufficient reason for a divorce. The women dare not admit of a visit, even from a brother, except it be in the presence of the husband, who may lawfully kill any man he finds alone with his wife, or on whom she has conferred any mark of her favour. The man, on the other hand, may keep as many wives and concubines as he pleases, and nothing is more ignominious than the want of children, and having but one wife. This love of women, and desire of children, is here universal, and the happiness of a man is rated according to the number of his women and children.

The women of fashion are, however, allowed at certain festivals to go abroad, and spend their time in public company, in dancing and other diversions; but the men do not mix with them: however, they have the pleasure of seeing and being seen, which makes them impatiently wait for these happy times.

They rub the limbs of their infants with oil to render them nimble and active, and this is thought to be one reason, why a lame or crooked person is hardly ever seen among them. The male children of persons of rank, it is said, are always taken from their mothers at six or seven years of age, and committed to the care of some distant relation, to prevent their being too much indulged, and rendered effeminate by the mother's fond caresses. They are sent to school to their priests, who teach them to read, write, and cast up accounts, and of whom they learn the precepts of the Koran. Their characters very nearly resemble the Arabic, which is not strange, if it be true, as some have asserted, that the ancestors of many of them were Arabians. Every child is also bred up to some handicraft trade, and if they are of quality, they are likewise taught several sports, and martial exercises.

Children are generally matched by their parents in their infancy, and sometimes soon after they are born. When the youth is sixteen or seventeen years of age, and has gone through his exercises, he is allowed to wait on his mistress, and soon after to marry her. The exercises taught to youth are learning to ride, to discharge a fusée, to draw the bow, handle his scymeter and dagger, and to shoot the little darts already mentioned through a smooth trunk of ebony, or other wood. This dart is pointed with the tooth of a sea-fish dipt in poison; and with these they are said to hit a small mark at the distance of fourscore yards. One who has made arms his profession is so much a gentleman, that he will seldom submit afterwards to husbandry, or any mean employment.

They have games not unlike draughts and chess; but, as they are prohibited playing for money, they seldom quarrel on these occasions. They are fond of flying a paper kite, and even old men are pleased with it; and cock-fighting is one of their greatest diversions.

The girls are taught to read and write, and instructed in all kinds of housewifery. They learn to spin, to sew, to embroider and make their own, and the men's cloaths; for there are neither tailors nor mantua-makers among them, nor are there any cooks, and therefore they are taught to dress such dishes as are in use amongst them.

Their common food is rice, herbs, roots, fish, and fruit. They have likewise beef, kid, and poultry, which being boiled, and high seasoned with spices, is cut in small pieces and laid by their rice; but they eat very little flesh. They have only two meals a day, one at eight or nine in the morning, and the other about sun-set, which is their principal and heartiest meal; the rest of the day they chew betel and arcea, or smoke tobacco, with a mixture of opium. Their usual drink is water or sherbat; they also drink chocolate, tea, and coffee, the first of which they procure from the Spaniards of the Philippines. They have likewise palm wine and arrack.

At

At their meals they sit cross-legged on the floor, and have low japan tables, on which their provisions are set in dishes of silver, copper, or wood. No spoons, knives, forks, or napkins are used, but they take up the rice with their hands, and making it up in lumps, put it in their mouths. There are but few slaves in the country, the laws prohibiting their making slaves of their brethren of the same faith; and on this account they are more active and industrious than other Indians, from their being used to labour, and to do their work themselves. Their great men are, however, never without a train of vassals or hired servants when they appear in public; but many of them are only hired upon these occasions, and may be had upon very reasonable terms.

Their houses are built with ebony, and other fine wood of various colours, and the inside being rubbed every day, makes the wood look more beautiful than any wainscot. They are in other respects very neat, and have their mats and carpets upon which they sit, dusted every morning, and besides have vessels to spit in when they chew their betel, or smoke tobacco. They have little furniture, besides the necessary utensils of their kitchens. The rest of the household goods consist of carpets, couches, on which they sleep; pillows and cushions, and the little tables on which they eat. At their visits a carpet and cushion is always brought for the strangers to sit upon, as chairs are set in this part of the world.

SECT: III.

Of their Buildings; with a Description of the City of Macassar. Of the Government and Laws of the Country. Of their Marriages and Funerals.

THE city of Macassar is seated on the banks of the great river above mentioned, and here the Dutch East India company have a strong fort, defended by a numerous artillery, and a garrison of seven or eight hundred men. The streets are wide and neat, but not paved, and trees are planted on each side. The palaces, mosques, and houses of the great are of stone, but those of the meaner sort are of wood of various colours, built on pillars, and the roofs covered with palm or cocoa leaves. Along the streets are shops, and there are also large market places, where a market is held twice in twenty-four hours, that is, in the morning before sun-rise, and an hour before sun-set. There only women are seen, for a man would be laughed at on being found among them. Young girls from all the villages crowd to these markets with flesh, fowls, fish, and rice; for they only abstain from pork, which is forbidden by their religion.

The number of inhabitants in this city and the neighbouring villages has been computed to amount to one hundred and sixty thousand men able to bear arms, but there are not now half that number; for since the Dutch deprived them of their trade, many of the natives both of that city and the other towns and villages have forsaken their country.

The government was anciently monarchical; but that the crown might never descend to an infant, unable to govern or protect the people, it was inherited by the king's eldest brother, and all his children excluded. Though the king was an absolute monarch, his prime minister disposed of almost all places of trust in the civil government, first giving a list of them to the king; but the officers of the household, and of the revenue, were appointed by the sovereign, who took care to muster his troops every month. His forces in time of peace had nothing allowed them but their cloaths, arms, and ammunition; but if they were drawn into actual service, they were subsisted at the king's expence; and it is said, that in some of the former wars he brought twelve thousand horse, and fourscore thousand foot into the field. These infantry, as hath been already observed, are esteemed the best in this part of the world; but their horses are not only small, but have no saddles, or other accoutrements proper for that purpose. As for their artillery, the great guns are of a large bore, but their powder is so weak, that they seldom do much execution. Their armies are divided into regiments and battalions, and these again

into companies of two hundred men each, with three officers, equivalent to our captain, lieutenant, and ensign.

The princes of this island formerly divided some of their lands among the great lords, as is the practice in several of the neighbouring countries; and all the inhabitants of such a lordship were, in a manner, the vassals of the lord, who himself held these lands of the prince, by certain rents and services, and was particularly bound to attend the king in his wars with a certain number of soldiers at his own expence. These lords never appear at court, or in any public place, without being attended by four-score or a hundred of their vassals and tenants. These were considered as the principal nobility of the island, and accordingly took place immediately after the royal family. There were besides two inferior orders of nobility, who held their estates by nearly the same tenure, but had smaller districts, or perhaps no more than a particular village under their command.

But the last war of Macassar ended in the complete ruin of the prince of the country; and the inland parts of the island are under the dominion of three different princes, who, very happily for the Dutch, live in a constant bad intelligence with each other; and were it not for this they might at any time drive the Dutch out of the island. One of these princes is called the company's king, because he lives in a good correspondence with them, and promotes their interest as far as lies in his power. In return, they from time to time make him presents of gold chains, coronets of gold, set with precious stones, and other things of value, in order to keep him steadily to his alliance, and prevent his coming to a good understanding with the other princes.

Among the natives of this country are no lawyers, attorneys, or bailiffs; but, every one exhibiting his complaint in person, speedy justice is executed, as in other Mahometan countries. In criminal matters, indeed, they are frequently allowed to do themselves justice; and whoever takes a murderer, adulterer, or robber in the fact, may execute him himself: but the highwaymen in this country hardly ever murder those they rob, except in their own defence.

The daughters have no other portion upon their marriage, but the presents made them before that ceremony is performed; this is done by a priest: after which, while all the guests are for three days rejoicing at the house of the wife's father, the new-married couple are shut up in an apartment by themselves; with only a servant to bring them what they want; and when that time is expired, the bridegroom and bride come out and receive the congratulations of their friends: after which the bridegroom conducts her to his own house, where she immediately applies herself to the business of the family; for the ladies are not here indulged in the laziness practised in many other Eastern nations.

If the woman survives her husband, and has no children, she retains only half of the presents that were made her, and the other half goes to the father or mother of the husband: but if she has children she keeps the whole, and disposes of them as she thinks fit; except she marries again; and then she has but a third part of the jewels, &c.

When the parents die without disposing of their effects, they are divided among the sons; and if there are none, among the daughters. They never share the inheritance with their brothers, who are only obliged to maintain them 'till they get husbands.

If a man is desirous of being divorced, he need only acquaint the priest; and if there be the least reason to suspect the woman of levity, or even an unguarded conduct, it is never denied. The secular judge pronounces the divorce, and settles the conditions; after which they are both at liberty to marry again.

As all the domestic uneasiness is occasioned by their concubines, persons of quality generally keep them in an apartment distinct from the house; for the ladies of Macassar have such spirit, that there are instances of a wife's stabbing to the heart a beloved concubine in the arms of her husband.

We shall treat of their purifications and the circumcision of their children when we come to other Mahometan countries. As to their funerals, the meanest persons lay up money to defray the expence of them, while they are in

full health. The sick no sooner find some dangerous symptoms, than leaving the physician, they send for their priests, who have recourse to prayers and exorcisms, and attributing their disease to the practices of some evil spirit, write the names of God and Mahomet on little scrolls of paper, and then hang them about the patient's neck: if these have no effect, they proceed to prepare him for his dissolution.

A person is no sooner dead than his corpse is washed, perfumed, and cloathed in a white robe, with a turban on his head, and placed in a chamber hung with white,

which is constantly perfumed with incense and aromatic gums. He is carried on a palanquin, or couch, by his slaves to the grave, followed by the priests, incense and perfumes being burnt all the way. The corpse is interred without a coffin, covered only with a plank, and the earth thrown upon it. A tomb, adorned with flowers, is afterwards erected suitable to the quality of the deceased; and perfumes are burnt for forty days; after which a noble entertainment is prepared for those who come to pay their last devoirs to the deceased.

C H A P. X.

Of the MOLUCCAS, or SPICE ISLANDS.

SECT. I.

A general History of the Trade to the Spice Islands; with a concise View of the first Voyages of the Portuguese, Spaniards, English, and Dutch to the East Indies; and of the Practices by which the Dutch excluded the English from that beneficial Branch of Commerce.

FOR above two thousand years Europe has partaken of the spices of the East, though it is little more than two hundred years since we became acquainted with the islands where they grow. The Persians, Arabians, and Egyptians formerly brought them through the Red Sea, and from thence down the Nile to the coast of Egypt; and thither the Carthaginians, the Greeks, the Romans, the republic of Marseilles, and afterwards the Venetians, the Genoese, and Catalans resorted to buy the spices and silks of India; which, at a most extravagant profit, they dispersed over all Europe.

The Mahometans of Arabia, and the neighbouring countries, improperly called Moors by the first discoverers of the Indies, in order to carry on this trade to the greatest advantage, planted colonies on all the oriental islands, and drove the native inhabitants from the coasts up into the mountains, where they retained their former religion, their liberty, and customs; but lived in a perpetual state of hostility with the unjust invaders, who had driven them from their spicy groves. Thus the aromatic sweets of these islands were almost as fatal to the inhabitants, as the gold and silver of Mexico and Peru were long after to the unhappy natives of those regions of America; but the orientals better preserved their native freedom. They still continue to slay and plunder those who fall into their power, and hence are denominated savage murderers and robbers; while both the Christians and Mahometans, on the other hand, seize every opportunity of destroying them, and of reducing all who fall into their hands to a state of slavery; and then call themselves very honest men.

At length several European republics having acquired immense wealth, by purchasing the spices brought to Egypt, and selling them at prodigious profit, the Portuguese, who had been sixty years in making discoveries along the coast of Africa, in 1486, reached the Cape on its most southern extremity; and Bartholomew Diaz, who made the important discovery, gave it the name of Cabo Tormentoso, or the Cape of Storms, from the tempestuous weather he found there: but when he returned to Portugal with the joyful news, king John II. flattering himself that his ships would soon find a way by sea to the Indies, changed the name to Cabo de Buena Esperanza, or the Cape of Good Hope: but it was not till the year 1497, that Vasco di Gama, doubling that Cape with three ships, traced out a way to the East Indies; but before this time Columbus, in 1487, persuaded that it was possible to discover the Indies by sailing to the West, made the daring and prosperous voyage by which he gave a new world to Europe.

The Portuguese, continuing their discoveries, settled factories in different countries of the East, not subject to

the Moors; but met with constant opposition from those traders, who still carried on the commerce of the East. And at length they discovered the Spice Islands, and taking advantage of the differences which subsisted between the kings of Ternate and Tydore, who had long been at war with each other, they engaged those princes to refer their differences to them; and the people being ready to grant every thing they proposed, in hopes of their alliance, they found no difficulty in settling their factories and building forts. These they soon erected in many parts of the Indies, and every where treated the natives as their vassals.

The Portuguese having thus established themselves in the East Indies, and having the pope's bull, as well as an agreement with the Spaniards to secure their pretensions, assumed the lofty title of lords of the navigation, conquest, and commerce of Ethiopia, Arabia, Persia, and India; and continued to erect forts and cities at convenient distances along the African, Arabian, Persian, and Indian coasts, and particularly in the Spice Islands.

By the abovementioned bull pope Alexander VI. had unjustly granted to the Spanish crown the property and dominion of all places, either already discovered, or that should be discovered, an hundred leagues to the westward of the islands of the Azores, leaving all the unknown countries to the eastward of this limitation, to the Portuguese; and this boundary being afterwards, by the agreement of both nations, removed two hundred and fifty leagues more to the westward, it was imagined, that this regulation would have suppressed all the seeds of future contests: the Spaniards presuming, that the Portuguese would be prevented from meddling with their American colonies; and the Portuguese supposing, that their East Indian settlements, and particularly their spice islands, would be for ever secured from any attempts of the Spaniards.

But it seems, as an ingenious author observes, that on this occasion, the infallibility of the Holy Father had deserted him, and for want of being more conversant in geography, he had not foreseen that the Spaniards, by pursuing their discoveries to the West, and the Portuguese to the East, might at last meet, and be again embroiled, as it actually happened within a few years after. For Ferdinand Magellan, an officer in the king of Portugal's service, having received some disgust, entered into the service of the king of Spain, and in 1519 set sail from the port of Seville, with five ships and two hundred and thirty men, and having had the good fortune to discover those streights, which have received their name from him, opened a passage into the South Sea; he at length crossed that extensive ocean, and first discovered the Ladrões, and afterwards the Philippines, where venturing on shore in an hostile manner, and skirmishing with the natives, he was slain.

Magellan's original design of securing some of the Spice Islands was defeated by his death; for those who were left in command contented themselves with ranging through them, and purchasing spices of the native; after which they returned home round the Cape of Good Hope, and these were the first ships that surrounded this terraqueous globe, and by this means demonstrated by an experiment obvious

obvious to the most unlettered mind, the reality of its long disputed spherical form. But though Spain did not acquire the property of the Spice Islands, yet the discovery of the Philippines was thought too considerable to be neglected, as they were not only near the places that produced spices, but were well situated for a trade to China and the commerce of other parts of India. A communication was therefore soon established between these islands and the Spanish colonies on the coast of Peru; whence the city of Manilla, which was built on the island of Luconia, soon became the mart of all Indian commodities, which were bought up by the Spanish inhabitants, and annually sent to Peru.

The next European nation that visited the Spice Islands was the English, under the command of Sir Francis Drake, who set sail from Plymouth on the thirteenth of December 1577, with five ships, and one hundred and sixty-four men, and passing through the Straights of Magellan, took many rich ships, and afterwards crossing the South Sea arrived at the Molucca Islands on the fourteenth of November 1579, and sent a present to the king of Ternate; who was so pleased with his behaviour, and so exasperated at the insolent behaviour of the Portuguese, who pretended to debar his subjects from trading with any other nation, that he desired the assistance and protection of the queen of England. The admiral had several conferences with this prince and the chief men of the country, by whom he was splendidly entertained; and having purchased a considerable quantity of cloves, he set sail for England, where he arrived on the third of November 1580.

In 1587 Mr. Cavendish sailed round the world, pursuing the course taken by admiral Drake, and touching at the Moluccas, found the natives still desirous of trading with the English; he then sailed to the Isle of Java, and afterwards returned by the Cape of Good Hope to England.

Spain and Portugal had been united in 1580 under one head; and the Dutch, by the assistance of England, had freed themselves from the rigour of the Spanish yoke and the terrors of the Inquisition. The United Provinces affording an asylum to all who fled from the cruelty of the Spaniards, a multitude of merchants resorted thither, filled the country with money, and in the different branches of commerce they carried on, bred up numbers of mariners, whose experience and boldness enabled them to carry into execution almost any sort of naval undertaking with success; and having first endeavoured in vain to discover the north-east passage to the Indies, the city of Amsterdam, in 1595, fitted out four ships for the East Indies, which the next year arrived at Bantam, in the Isle of Java, where they purchased spices, and returned with a rich cargo to Holland.

They made other successful voyages without discovering the Spice Islands, though the Spaniards, enraged that a few merchants, the rebels of their state, should thus successfully rob them of a valuable branch of their commerce, fitted out strong squadrons to chastise them; but the Dutch merchants conquered all opposition, sunk, burned, and took their ships, and still returned loaded with spices. Among these adventurers admiral Van Nort sailed through the Straights of Magellan, and had the glory of being the first Hollander who surmounted the globe.

At length, in 1599, James Van Neck sailed with eight ships to Bantam, in the island of Java, where the Portuguese had been expelled on a quarrel between them and the natives. Here four ships took in their lading of pepper, while the other four under Van Warwyk sailed to the Moluccas; two of them took in their lading of cloves at Amboyna and Ternate, and the other two sailed to Banda, where having settled a factory, as the other ships did at Ternate, they freighted their ships with nutmegs and mace, and returned to Holland in 1600.

The Dutch in these expeditions behaved with a modesty and moderation very different from the pride and insolence which their own success afterwards occasioned. So great was their humanity to their prisoners, and with such honour did they behave in every thing that related to them, that the Spanish governors at Malacca and in the Moluccas gave them ample testimonies of their kindness and generosity; a character the more undoubted, as proceeding from their rivals and their enemies. "This good con-

duct," says the author of *The new History of the Indies*; "contributed in a great measure to the success of their designs, by wiping off the imputation of piracy, and gaining them the character of a humane and generous nation amongst the Eastern princes; an advantage by so much the greater, as the Portuguese were already of a long time hated for the weight and severity of their yoke."

In the mean time a multitude of Dutch companies were formed, which, as they were rivals in interest, no harmony or good understanding subsisted between them. Ships were fitted out by several societies for the same ports, and their cargoes, consisting of assortments, glutted the markets with the same commodities, and discouraged all the adventurers by the loss on the sales, or the stagnation of their capitals. The States General, taking into consideration the proper methods to put a stop to these evils which threatened the ruin of this favourite trade, called together at the Hague the directors of all the different companies, and obliged them to unite into one body corporate, granting them particular privileges. Things being thus settled, the company advanced by rapid steps; numbers of the richest persons in the state added their stocks to its capital, which now amounted to six millions six hundred thousand florins.

The Dutch now enlarged their views, and with this treasure, added to their united forces, fitted out strong fleets to the East Indies; and being an overmatch for the Portuguese, attacked their ships wherever they met them, and took one place after another, till they hardly left them a fort or factory in India. In 1605 Van Hagen, with twelve ships, defeated the Portuguese, and made themselves masters of the fort at Amboyna. A part of the fleet then sailed to Tydore, and attacking a Portuguese fortress in that island, the magazine of powder in the castle blew up, and destroying part of the wall, gave the Dutch an easier conquest than they expected. But the next year the Spaniards recovered these forts from the Dutch: but they soon got footing there again, as allies to the king of Ternate.

In 1609 the Dutch arriving at Banda with a strong fleet and forces on board, demanded leave of the oran cayas, or states of the country, to build a fort in the small isle of Nero, to defend them from the insults of the Portuguese and Spaniards; but the Bandanese, alarmed at the proposal, and at the greatness of the fleet they saw on the coast, apprehended their liberties to be in danger, and absolutely refused to comply with this demand: upon which the Dutch making a descent with a good body of troops, attacked and routed the Bandanese; who finding themselves too weak to withstand the force of so powerful an enemy, had recourse to artifice, and pretended to submit to the building a fort; when the Dutch desiring to treat with them on the exclusion of all other nations, the natives drew admiral Varheuf and several officers into a wood, where, having laid an ambuscade, they were all slain. This treachery the Dutch revenged by making war on that people, which they continued till they were entirely subdued; though the natives, as the best expedient to preserve their expiring liberties, implored the protection of the English, who had for several years traded to these islands.

The English in their first attempts to establish a trade in the East Indies were very unsuccessful; notwithstanding which an English East India company was incorporated by letters patent in 1600; but the Dutch, who had already gained a footing in the Spice Islands, forgetting the obligations they were under to the English, and puffed up with their extraordinary success, had begun to monopolize the spice trade, and treated all the English who approached those islands with acts of hostility and the grossest abuse; yet, in spite of all opposition, captain Keeling settled an English factory at Bantam, in the Isle of Java, in 1609; and in 1616 the principal persons of the islands of Pooloroon and Pooloway made a formal surrender of those islands to Mr. Nathaniel Courthop, Mr. Thomas Spurway, and Mr. Sophon Cozocke, for the use of his majesty James I. in consideration of their being protected against the Dutch, and annually supplied by the English with rice, cloathing, and other necessaries. Upon this occasion a writing was drawn up and signed by both parties. They also delivered a nutmeg-tree, taken up with the roots, and the fruit

upon it, and a live goat by way of feisin; and, at their desire, the English colours were planted in the island of Pooloroon, and thirty-six guns were fired in honour of this cession.

The king and principal persons of Wayre and Rosu- ing also surrendered those islands to England on the same conditions.

Lantore, or Banda, also sought the protection of the English; and on the twenty-fourth of November 1620, the chiefs of that island surrendered it up in form by a writing, which they signed and delivered to Mr. Hayes, who took the command of an English fort erected there.

Nothing could be more honourable with respect to the English; nothing could convey a better title, than the surrender of these islands by the people who possessed them. The free consent and voluntary surrender of the natives surely gives a claim to a country more noble, more just, and equitable than force can ever obtain, or conquest bestow. But the Dutch, in time of peace, took our ships, besieged our forts, and carried on an open war with the English in the Indies; while the states of Holland, just redeemed from slavery by those they now so ungenerously, so ungratefully opposed, cajoled the pusillanimous monarch James the First, who, to the disgrace of England, then filled the British throne.

While things were in this situation a treaty was signed by both nations in Europe, and ratified by the sovereigns of each, the ministers on both sides governing the debates, and obliging each company to accept of such terms as they thought fit. By this treaty it was agreed, That the English company should enjoy a free trade at Padicate, and bear half the charge of maintaining the fort and garrison there. " That in the isles of the Moluccas, Banda, and " Amboyna, the trade should be so regulated by common " consent, that the English company should enjoy a third " part of that trade, as well for the importing and selling " of goods in those islands, as of the fruits and merchan- " dize of the growth of those islands, which should be " exported thence; and the Dutch company enjoy the " other two-thirds. And that as to the buying and shar- " ing the said fruits and merchandizes, the principal fac- " tors of the two nations should buy them at the current " price, and divide them by lot, to each their respective " share; and for that end it should be lawful for either " party to have access to, and abide in, the forts and ma- " gazines of the other; and that the forts, as well on the " one part as the other, should remain in the hands of " those who were at present in the possession of them."

But no sooner was this treaty, so favourable to the Dutch, known to the Indies, than, contrary to the ex- pects words of the treaty, they invaded the islands of Lantore and Pooloroon, which were in the possession of the English, massacred the principal natives, demolished the forts and factories of the English, murdered some of their servants, and made the rest prisoners; using them in a more insolent and barbarous manner than would have been practised by a declared enemy.

It is not easy to account for the strange regulation by which the English company were obliged to accept of a third part of the spice trade, when the Banda islands were their property: but when it was consented to, and ratified by the supreme powers of both nations, the Dutch might surely have permitted the English to enjoy this one-third in quiet, and to have retained the islands in their possession.

In pursuance of the above treaty, the English company settled factories at the Moluccas, at Amboyna, and Banda, for carrying on the trade in the stipulated proportion; imagining that the Dutch had made so advantageous a bargain for themselves, that they for the future should receive no molestation from them. But scarcely were they fixed in their settlements, when the Dutch traders, in the year 1622, formed a sium plot, charging the English and Japanese with a conspiracy to surprize their principal fort at Amboyna, and barbarously tortured them to make them sign a false confession of their intending to attack them. They even, contrary to the law of nations, put several of the English and Japanese to death, as if they had been their subjects taken in rebellion, and then expelled those who survived their cruelties.—But the story is too dreadful for repetition; the writer of this work is struck with hor-

ror, and gladly escapes from scenes which shock humanity.—However, it is necessary to observe, that these unhappy victims of the cruelty of the Dutch died professing their innocence in the strongest terms; and that these proceedings were attested, upon oath, in the court of admiralty, by the English factors who were suffered to escape to England.

The Dutch immediately after seized upon all the English factories in the Spice Islands, and have ever since excluded us and all other nations from that valuable branch of commerce.

S E C T. II.

Of the Situation and Produce of the Moluccas or Spice Islands in general. The Persons and Dress of the Natives.

THE Moluccas are a cluster of small islands situated between New Guinea, which lies to the east, and Celebes to the west, extending from one hundred and twenty-one to one hundred and thirty degrees of east longitude from London, and from the fifth degree of north latitude to the seventh degree south. They are named Moluccas from the word Moloc, which in the language of those countries signifies head, they being situated as it were at the head or entrance of the Archipelago of St. Lazarus, and are denominated Spice Islands from their abounding in spices, particularly nutmegs and cloves, which grow in no other countries in the known world.

This small part of the globe produces such plenty of these fragrant spices that great quantities of cloves drop ungathered from the trees, and are suffered to rot on the ground; and millions of nutmegs are often destroyed on the spot by the Dutch, who have monopolized these commodities, to prevent the markets being overstocked, which would infallibly lower the price of them. Sir William Temple, in his Observations on the Netherlands, says, he was informed by an East India seaman, that he saw three heaps of nutmegs burnt at one time, each of which would fill a small church.

The Molucca islands are separated by narrow freights, which are rendered dangerous by sands and shelves; yet several of them have good roads. The soil of these islands is dry and spongy, so that it immediately soaks up the rain, and is always covered with grass and ever-verdant shrubs. The air is unwholesome, and occasions dropsies, for which the natives formerly used wine made in the Philippine islands, mixed with ginger and cloves, and the Dutch the juice of lemons. There is no difference here between summer and winter, nor any certain season for rains.

In the Moluccas are neither corn, rice, nor hardly any butchers meat, but goats flesh. They eat chiefly sago, the pith of a tree made into cakes, instead of bread: here are also almonds, oranges, lemons, and other fruit.

The natives have large eyes and long hair on their eyebrows, which they paint: they are of a yellowish brown complexion, but the women are fairer than the men, and tolerably handsome. They generally wear their hair falling loose on their shoulders, and anoint it with sweet-scented oil; but sometimes they tie it up neatly with flowers and feathers. They are fond of bracelets, ear-rings with bobs, and wear necklaces of diamonds or rubies, without any distinction of quality; and most of their cloaths are of silk.

The general language used by the natives of these islands is the Malayan, and their religions the Mahometan and Pagan. They punish robbery with great severity, but easily forgive adultery, from the maxim that propagation cannot be too much encouraged. They extract a liquor from the sago-tree, called tuas, which, when new, is sweet and very fattening; and when boiled has the taste of wine. They draw another from bamboos and cocoa-trees.

Here are said to be serpents above thirty feet long, but not venomous. Some authors say, that after eating a certain herb they ascend the trees on the banks of the sea or rivers, from whence they vomit it into the water; and the fish eagerly devouring it, are soon so intoxicated, that they swim on the surface, and become an easy prey to these serpents.

Crocodiles

Crocodiles are here more dangerous by land than by water: there are here also two sorts of sea-crabs, one of which is poisonous; but the other feeds on herbs, and is very wholesome food.

S E C T. III.

Of the principal Moluccas, or Spice Islands, including Ternate, Tydore, Machian, Motyr, Bachiau, and Amboyna; with a particular Description of the Clove-Tree.

THE island of Ternate is the chief, though not the largest of the Molucca islands: it abounds with all sorts of provisions, and whatever is necessary to render life easy and agreeable. The inhabitants are a middle-sized people, and in general have a much better opinion of the Europeans than any of their neighbours. Most of them are Mahometans, or pagans; however, a great number of them are become Christians, and the king himself is of that religion. They make a kind of palm-wine, which is exceeding strong; and, as a small quantity of it will intoxicate a man, it is highly esteemed by the natives.

There is here a kind of birds that are the most beautiful imaginable; for their feathers, which are of all colours, are so finely diversified, that it is impossible to conceive any thing of the kind more charming. They are commonly sent to Batavia, where they are sold at a very high price, not only on account of their extraordinary beauty, but of their docility; for they are taught to sing finely, and to imitate the human voice.

This island is the most distant of all those which belong to the Dutch in the East, for which reason they consider it as a kind of frontier; it is therefore strongly fortified. The governor is a merchant, and, like other governors, has a council. The king of Ternate is esteemed the best ally the company has, and as his country would abound with cloves, at the company's request, he causes them to be grubbed up every year; for which they allow him an annual pension of eighteen or twenty thousand rix-dollars. He has concluded a perpetual alliance with the Dutch, by which he has obliged himself to assist them against all their enemies. On the other hand, the company treat him with the utmost respect, and afford him whatever assistance he stands in need of. He has a numerous life-guard, and a very strong fort, in which there is a good garrison maintained by the company. The kings of Tydore and Bachian are now his tributaries.

The Dutch India company dispose of great quantities of cloth in this island, and also of such goods as they receive from Guinea; in return, they receive from thence tortoise-shell and other commodities; and some years ago a gold mine was discovered there, richer than any in the Moluccas, and from thence the company have doubtless received great profit.

Tydore is upwards of thirty miles in circumference: the chief town is of the same name, and has a pretty good harbour, but a chain of rocks lies before it, and renders the entrance very dangerous. The town is strongly situated by nature; but the Dutch have rendered it much stronger by art, having strengthened it by modern fortifications.

Machian is situated almost under the equator, but rather to the northward; it rises in the form of a sugar-loaf, with its top reaching above the clouds, and was once a very fertile country. The Dutch have three forts here, seated on inaccessible rocks. Here is said to be a clove-tree, that differs from all others, and is much esteemed on that account. The fruit is not purchased for money, but is presented by the governor in small quantities to his friends, as a most acceptable present.

Motyr nearly resembles Machian in its form and height, but is a smaller island. It is situated about half a degree to the northward of the line, and the Dutch have a fort at the north end. It formerly produced great quantities of cloves.

Bachian lies a little to the southward of the equinoctial, and is called Great Bachian to distinguish it from a small island of the same name situated near it. It has a very good harbour, the entrance of which is defended by a

strong fort called Barnevelt, built with stone. The island abounds in sagoe, fruit, and fish; and formerly produced great quantities of cloves.

Amboyna is one of the largest of the Moluccas, and is situated in the Archipelago of St. Lazarus, between the third and fourth degree of south latitude, and is one hundred and twenty leagues to the eastward of Batavia. It was conquered by the Portuguese in 1519, who erected a fort upon it, with a view of not only bridling the inhabitants, but of keeping a force there sufficient to subdue all the adjacent islands. This fort was, however, taken from them by the Dutch in 1605; and in 1622 the English were deprived of their share of it in a manner equally base and shocking to humanity. But of this we have already given some account in the first section of this chapter.

Amboyna is the center of the rich commerce in cloves; and the more effectually to keep it there, the company have caused all the clove-trees in the adjacent islands to be grubbed up and destroyed, and sometimes when the quantity produced at Amboyna in one season is extraordinary great, they even burn a part of that.

The clove-tree resembles the laurel, only the leaves being narrower, are more like those of the almond and willow; the very wood and leaves taste as strong as the cloves themselves. The trees bear a great quantity of branches and flowers, and each of the flowers bring forth a clove, which is at first white, then green, and at last red, and pretty hard. While they are green, they have the most fragrant and refreshing scent imaginable.

These cloves grow with little stalks, and hang on the trees like cherries. When they gather them, instead of plucking them off one by one, some strip them off the boughs with a rope, and others beat them down with long poles. They bear fruit when they are eight years old, and are said to continue bearing for above an hundred years; they ripen from the latter end of August till the beginning of January; and it is remarkable, that their heat is so great, that no vegetable, not even a weed, will grow under the tree. A few days after the fruit is fallen, they collect the cloves together, and dry them before the fire on hurdles, by which means they lose the beautiful red colour they derive from nature, and change to a deep purple, or rather black. This is perhaps also occasioned by their being sprinkled with water, which it is said is necessary to hinder the worm from getting into the fruit.

It might be imagined that so rich a commerce as that in cloves would be sufficient to repay the expence the company is at in this island; but such care do they take to improve every thing to the best advantage, that they have caused coffee to be planted in Amboyna. Gold is also said to be washed down by torrents from the mountains; and among other valuable productions of this island, is a kind of red wood, which, besides the beauty of its colour, is exceeding firm and durable, and what must appear still more extraordinary, its grain naturally runs into abundance of beautiful figures. With this wood they make tables, escutiores, and other pieces of furniture, of which presents are made to the principal persons of the government, and the rest sold all over the Indies at a very high price.

The inhabitants, who live on the coast, were probably descended from the Moors. These are of a middle stature, and of a black complexion; they are in general very lazy, and most of them have a strong propensity to thieving. Some are, however, very ingenious, and have a singular art in working up the cloves, while green, into abundance of curious toys, as ships, crowns, houses, &c. which are usually sent to Europe as presents, and they are esteemed extraordinary curiosities. Those of the Amboynese, who dwell near the coast, are subject to the king, and profess the Mahometan religion; but, besides these, there is a great number of idolaters, who were probably the original natives, and were driven into the mountains, where they still preserve their freedom; but both the king and the company consider them as savages. They frequently attack and kill those persons who fall into their hands, and whenever any of them are caught, they are condemned to perpetual slavery, employed in the most laborious works, and treated with the utmost rigour. An inexpressible hatred subsists between these people, and the rest of the inhabitants,

thants, with whom they are in perpetual war, and to whom they very seldom give quarter. They are armed with a sword, a kind of pike or javelin, and a buckler.

The king of Amboyna has an annual pension from the company, with a guard of European soldiers maintained at their expence. The company's force in Amboyna principally consists in the garrison, which is very numerous, and composed of their best troops. The fort is so strong, both from art and nature, that it is in a manner impregnable; and so effectually commands the harbour, that it seems impossible for a vessel to sail in or out without being sunk by the cannon of the fort, if the governor should give orders for that purpose.

It is no wonder that this island is so strongly fortified. It has been termed the gold mine of the company, on account of the vast profit they draw from it; and there being no reason to fear its ever being exhausted. As a proof of this, it need only be observed, that a pound weight of either cloves or nutmegs does not cost the company much above a halfpenny, and every body knows the high price at which they sell in Europe.

SECT. IV.

Of the Island of Gilolo, sometimes included among the Moluccas, and the neighbouring Isles of Ceram, Bouro, and Bouton.

THERE are four islands frequently included among the Moluccas, which are larger than the spice islands, but are said to produce neither cloves nor nutmegs, or such small quantities of them as are scarcely worth mentioning; these are, Gilolo, Ceram, Bouro, and Bouton.

Gilolo extends from two degrees north to one degree south latitude, a little to the eastward of the islands of Ternate and Tydore, and is upwards of two hundred miles in length, but in most places is not above fifty miles broad. It is divided by three deep bays, which, at a small distance, give it the appearance of so many islands, and in these bays ships may ride in safety.

Ceram is situated in three degrees south latitude, and stretching from east to west is about fifty leagues in length, but not above twenty in breadth. It is high land, and covered with trees. At the principal town, which is named Cambello, the king resides; but the Dutch have a fortress there, and both the king and people are vassals to the company.

The island of Bouro, which is in the latitude of two degrees south, is about forty or fifty leagues in circumference, and the country is indifferently fertile. The Dutch were formerly in a great measure masters of it, from their having a very strong fort there; but the inhabitants, after a long siege, demolished it, having first put all the garrison to the sword. At present the company are satisfied with sending annually a number of men to root out the clove-trees, and the natives receive a present at the same time, for suffering this to be done. The island is for the most part pretty high land, and abounds with trees and shrubs of various kinds.

The situation of the island of Bouton is remarkably advantageous; it extends from the fourth to the sixth degree of south latitude, and is about four or five leagues distant from the south-east part of the island of Celebes, and is in extent nearly equal to the isle of Bouro. It is extremely fertile in rice; it also enjoys plenty of cattle and fish, and would produce a great number both of clove and nutmeg-trees, were they permitted to grow.

The king has a very strong fort, on which the Dutch standard is displayed, though there is no Dutch garrison, nor indeed any need of one. The Dutch company are satisfied with sending thither every year some deputies to see the spice-trees destroyed, and in consideration of the king's submitting to this, the company pay him a considerable sum in ready money. This nation has been remarkably faithful to the East India company, whom they not only assisted in expelling the Portuguese, but in opposing the inhabitants of the neighbouring islands whenever they attempted to take up arms against them, in consideration of which the inhabitants of Bouton are permitted to enjoy many privileges that are granted to no other

Indian nations. Thus, whenever they enter any fort belonging to the company, in whatever country it be, they are permitted to keep their arms, which is not allowed even to the inhabitants of the places where the Dutch forts are situated.

Some time ago the king of this island sent his eldest son ambassador to the governor-general of the Dutch company at Batavia, where he was received with all possible marks of distinction.

It would not have been easy to have distinguished this young prince to have been an Indian, had he not worn a turban of three rows high, richly embroidered with gold and precious stones, for the rest of his dress was entirely European; and instead of a cutlass, he wore a sword. His train was very numerous, and dressed after the Indian manner, twelve of them went armed, each with a cuirass, and buckler, and holding a naked sword.

SECT. V.

Of the Banda Islands.

Particularly of Banda Proper, with a Description of the Nutmeg-tree. Of Poolaway, Pooloroon, and the other Banda Islands.

WE now come to the Banda Islands, which are famous for their nutmegs. These lie from three degrees and a half to the fifth degree of south latitude, having the island of Ceram to the north, Celebes on the west, and the ocean on the east and south. The islands of Banda are first Banda, which gives name to the rest, Pooloway, Pooloroon, Nero, Rosising, Gonapi, and several small islands, of which travellers give no particular account.

The island of Banda is situated twenty leagues from Amboyna to the south of the Moluccas, and is somewhat more than twelve leagues in circumference. The governor is generally an eminent merchant, who resides at Neira, the capital of the country, and has under his jurisdiction several other small islands in its neighbourhood. The country is very hilly, and produces no less profit to the company, than the valuable island of Amboyna, from the important commerce in nutmegs, which grow here in such prodigious quantities, as to enable the Dutch to supply all the markets in Europe.

The tree that bears this excellent fruit very much resembles a pear-tree, but its leaves are like that of a peach, only they are shorter and rounder. It produces ripe fruit three times a year, that is, in April, August, and December; but the April nutmegs are the best, and in that month the crop is more plentiful than in the other two. The nutmeg, when ripe, is much of the same size as the walnut, and is covered with a thick shell, which opens and falls off of itself as the fruit ripens, and when candied has a very fine taste. Under this is a skin of a fine scarlet colour, and a very fragrant smell. This skin, which is called mace, also falls off the nutmeg, when it changes to an orange colour. Immediately under the mace appears the fruit, with a little bud at the top, resembling a very beautiful flower.

These nutmegs when preserved in sugar are much esteemed, as being the best sweetmeats in the Indies. But those commonly used in Europe are only well dried, after their being first thrown into quick lime, which is done to prevent the worms breeding in them.

There are several islands in the neighbourhood of Banda, in which nutmegs would grow, did not the company take care to have them destroyed every year; for there is a kind of birds in this and the neighbouring islands, shaped like a cuckoo, which picking off the green husk, swallow the nuts; and these having been some time in the stomach, they void by the ordinary way, after which they take root in the place where they fall, and grow up to a tree: whence the Dutch properly stile these birds the gardeners of the spice-islands.

There likewise grows in this island, as well as at Amboyna, a tree called caliputte, from which they draw a rich and salutary oil, that is sold at a very high price.

Among the inhabitants are a kind of free burghesses, called perkiniers, to whom are intrusted the care of curing the nutmegs, and furnishing the company with what quantities they think proper to demand. These people live much at their ease, though they receive a very moderate gratification.

Banda is so well fortified, that it is thought impregnable; yet to prevent an enemy from getting into the port under Dutch colours, there is always a squadron of small vessels plying round the coast, which, on the first appearance of a strong ship, surround her, and examine whence she comes, whither she is bound, and what is her strength.

The garrison is numerous, and yet is in a worse condition than any other in the company's service. This arises from the want of provisions, for the island being extremely barren, produces little food, on which account the soldiers who have the misfortune to be stationed there are glad to eat cats, dogs, and any other animals they can get. Turtle is however pretty plentiful for about six months in the year, and after that season they think themselves very happy if they can sometimes catch a few fish. They make their bread of the juice of a tree, which, when first extracted, resembles the dregs of beer, but on being dried, becomes as hard as a stone; yet on its being put into water it swells and ferments, and thus becomes fit to eat, at least in a country where nothing else is to be got. Rice, butter, dried fish, and other provisions, are sent thither from Batavia, but are too dear for the soldiers to have any great plenty of them.

The natives of this island are represented by the Dutch as so cruel, perfidious, and untractable, that the company were forced in a great measure to root them out for their own security, and to settle a Dutch colony in the island; but how they will reconcile this treatment of the natives, who had never injured them, to the laws of justice and humanity, is not easy to determine. The colony they have settled there is indeed formed of the most debauched and abandoned people, who may probably much exceed the natives in wickedness. They are, however, generally soon carried off by the dry gripes, the epidemical disease of the country. For this reason, and because debauched young fellows are sometimes sent thither by their relations, the Dutch at Batavia call Banda The Island of Correction.

Poolowoy appears a perfect paradise; there nutmegs and the most delicious fruits were used to abound, and still the whole island seems like a garden furnished with all manner of varieties. Their only want is springs and rivers; but these are in some measure supplied by the frequent rains, and when these fail, the natives fetch water from Banda. The Dutch have a fort on the east side of this island, called

The Revenge: it is a regular pentagon, and esteemed one of the strongest places belonging to the Dutch in these islands, and the pleasantest residence of their Indian governors. This island the Dutch wrested from the English, in order to ingross all the spice trade to themselves, which they could not so easily do while other nations had access to this island.

Pooloroon being a barren island, the Dutch were neither induced by the pleasure nor the profit it afforded to take it from the English; the sole design of that expedition being to ingross the whole spice trade to themselves, which they could not so easily do while any other nation had access to that island.

The Isle of Nero is divided from Gorpi by a very small channel, and these, together with the island of Lantor, or Banda, form a very commodious harbour. The castle of Nero, or Nassau, stands in a plain close by the water-side; it is a large and strong fortification; and it being commanded by a rising ground at about the distance of a musket-shot, the Dutch have also built a strong fort upon that, and both are defended by numerous garrisons.

The largest of the Banda islands does not exceed twenty leagues in circumference, and most of them are much less. The many volcanoes and frequent earthquakes which happen here are very dreadful; for scarce a year passes without some mischief done by them, which greatly lessens the pleasure the Dutch would otherwise enjoy in this terrestrial paradise; particularly on the 1st of September 1763, was felt at Banda a most violent shock of an earthquake at about five in the afternoon; it lasted about four minutes, during which no person could keep on his feet: this shock was succeeded by several others the same evening, and in the night, during which the sea was much agitated, overflowed the country, and did great damage. The castle, governor's house, magazine, &c. were rendered useless, and the church full of cracks. More than three quarters of the north part of the island were destroyed, and Neira entirely ruined: no part escaped without great damages. At the same time the volcano Papenberg threw out vast stones, &c. but, what is very extraordinary, only seven persons were killed. The inhabitants of this island were obliged to live under tents, on account of the noises in the earth, which resembled the firing of cannon, for fear of greater calamities.

C H A P. XI.

OF JAVA, TIMOR, and the neighbouring Islands.

S E C T. I.

Of the Isle of JAVA.

Its Situation and Extent; the Climate, Monsoons, and Face of the Country. It is subject to Earthquakes.

THE island of Java extends from the hundred and fifth to the hundred and sixteenth degree of longitude from London, and from five degrees thirty minutes to eight degrees south latitude, and is about six hundred and sixty miles in length, and one hundred, and sometimes one hundred and fifty, in breadth. It extends almost due east and west, and has the isle of Borneo on the north, the island and straits of Baly towards the east, the Indian ocean to the south, and is separated from Sumatra at the west end by the famous straits of Sunda. From this last strait the islands of Java, Sumatra, and Borneo, are denominated Sunda islands.

As to the seasons and monsoons: on the north side of Java, and the islands which lie to the eastward, the worst weather is during the westerly winds, which generally begin in the first week in November. They blow fresh in December, and then the rains increase. In January the weather is at the worst, with respect to the wind and rain,

which continue till the latter end of March. In April the weather becomes fair, and the winds variable with calms; but sudden gusts of wind from the westward generally happen at the full and change of the moon. About the first of May the eastern monsoon may be said to be settled, and in June and July is frequently attended with rain, though when the easterly winds blow hardest there is none at all. During this monsoon the weather is generally pleasant and wholesome, and continues so till the latter end of September. In October the wind frequently shifts, but the easterly winds blow very faintly; and in the beginning of November the westerly monsoon sets in again; however, in some years the monsoons happen fifteen days sooner or later than in others.

It is observable, that the currents here constantly follow the winds, and set east-north-east, or west-south-west, as the monsoon does at sea.

The air is sweet and mild; great part of the land is fertile, and finely diversified with hills and valleys, which, near the city of Batavia, are improved by regular plantations, beautiful canals, and whatever can contribute to render a country pleasant and agreeable. The island produces not only every thing necessary for the subsistence of man, but a large proportion of those valuable effects which

form the commerce of the country. It is divided by many woods, mountains, and rivers, in which nature has bountifully bestowed her treasures; and it is certain that in some parts of the island are mines of gold.

Most of the mountains are so high as to be seen at sea at the distance of thirty or forty leagues, particularly that called the Blue Mountain, which is by far the highest. There are here however frequent and very terrible earthquakes, one of which happened when commodore Roggewein was there. It began about eight in the morning, and shook the city of Batavia and the adjacent places to such a degree, that the fall of the houses was every moment expected. The agitation of the waters in the road was so excessive, that their motion resembled that of a boiling pot, and in some places the earth opened. The inhabitants are persuaded that these earthquakes are caused by the mountain Parang, which is full of salt-petre, sulphur, and bitumen; and they maintain, that it is very common, after such an accident, to see a large cloud of smoke hang over the top of the mountain. Some years ago general Ribbeck, who commanded in the island, ascended to the top of that mountain with a considerable number of attendants. On his arrival there he perceived a large cavity, into which he caused a man to be let down, in order to examine the inside. When the man returned, he reported that the mountain was hollow within; that he heard on every side a most frightful noise that seemed to proceed from torrents of water; and that in several places he had seen flames burst out, and had been extremely afraid of going farther, from the apprehensions of his falling thro' some of the chasms, or of being stifled by the vapours.

The waters in the neighbourhood of this mountain are far from being wholesome, and even those that come to Batavia are impregnated with sulphur, so that the people who drink much of them contract various diseases, and particularly the dysentery; yet this water is so freed from all these sulphureous particles by being well boiled, that it then does no harm, though drank ever so copiously.

SECTION II.

Of the Trees and Plants of Java, with a particular Description of the Cocoa-Tree. Of the Animals of that Island.

THE fruits and plants of this island are excellent in their kind, and almost innumerable; one of the most valuable of the fruit-trees is the cocoa. This is a species of the palm, which grows in most places in the East and West Indies: it is large, straight, and insensibly grows smaller from the bottom to the top. The fruit hangs to the trunk in bunches, united by a tendril not unlike the twig of a vine, but stronger: the flowers are yellow, like that of a chestnut; and the branches are all towards the top. As it bears branches of fruit every month, some are always ripe, others green, and some just beginning to button. The fruit is of a greenish hue, and of different sizes from that of an ordinary ball to the bigness of a man's head. It is covered with two rinds, the outer composed of long tough threads, of a colour between red and yellow; but the second is as hard as a man's skull. Within there is a thick, firm, white substance, which in taste resembles a sweet almond. The inhabitants eat this substance with their victuals as we do bread, and by pressing it draw a liquor which in taste and consistence resembles almond-milk. This milk, being exposed to the fire, is converted into a kind of oil, which they use as we do butter, in their sauces, and as oil in their lamps; they likewise use it medicinally, and often rub their bodies with it. Besides this white substance found in the nut, there is a considerable quantity of a clean, bright, cool liquor, which tastes like sugar-water. They also draw from the tree itself a very agreeable liquor, which the Indians call *sura*, and the Europeans stile palm-wine; and indeed it is little inferior to Spanish white-wine, except in keeping; for in about two days time it turns sour, when they expose it to the sun, and by this means it becomes excellent vinegar. As this wine is strong and heady, they generally temper it with the clear water drawn from the nut. In order to extract this wine, they cut one of the largest twigs at the distance of about a foot from the tree, and

hang to it either a bottle or a calabash. This wine, when boiled, produces another; and by distilling it they also obtain a spirit, which many prefer to the arrack distilled from rice. Besides all these advantages the people in the East Indies reduce the bark of this tree into threads, of which they make very good cordage, and particularly cables. The timber is equally fit for building ships and houses, which are covered with the leaves of the same tree. It is said that in this country when the father of a family has a child born, he orders a cocoa-tree to be planted, that the child may afterwards know its own age, for on the trunk of this tree a circle annually rises, so that its age is known by inspection; and if any body asks the father how old his children are, he sends them to his cocoa-trees.

Pepper and coffee grow in the country, and about Batavia are several considerable sugar-plantations, and some of tobacco. However, no other corn but rice grows in the island: yet, though they have wheat imported from Bengal, the Europeans, after being a little time there, prefer boiled rice to bread.

Almost all sorts of garden stuff thrive there, and the seeds brought from Europe, Persia, and Surat, yield a great increase; so that the kitchen-gardens of Batavia afford peas, beans, roots, and herbs sufficient to supply that populous city.

There is a great number of woods and forests scattered over the island, in which there is a prodigious variety of wild beasts, such as apes, rhinoceroses, buffaloes, tigers, and wild horses: they likewise abound with an infinite variety of serpents, some of which are of a prodigious size. Crocodiles are also very large in Java, and are chiefly found in the mouths of rivers; for being amphibious animals, they delight most in marshes and savannahs. Some of these are from twenty to thirty-three feet long, but their legs are extremely short; and if a person has the presence of mind to turn frequently when he flies from one of them, he will easily escape, for they cannot turn about without taking up some time; and indeed they obtain most of their prey while lying among the reeds, like the trunk of an old tree, by the side of a river, and suddenly seize upon the incautious traveller before he is aware. They are, however, frequently taken by the Malaysians, who bait a large iron hook with a dog, which seems to be their favourite food, and then fish for them at the mouth of some rivulet or creek, where they usually lie to seize upon what is driven down towards the sea. The back of this animal is covered with such hard scales, that they are not to be penetrated even by a musket-ball; but he is easily killed if they come at his belly. These creatures are so much dreaded at Batavia, that the government allows a reward to those that take or kill them.

Here are fowls of all sorts, and extremely good, especially pheasants, partridges, wood-pigeons, and peacocks: for curiosity they have the Indian-bat, which differs but little in its form from ours; yet though the body is of the size of a rat, the wings, when extended, measure a full yard.

They have fish of different sorts in great plenty, and very good; so that for the value of three-pence enough may be bought to dine six or seven men. They have likewise a multitude of turtle.

As the flat country thus abounds with all sorts of provisions, great quantities are daily brought to Batavia; and, to prevent any danger of scarcity, the company's ships are continually employed in bringing provisions, spices, and other necessaries, from the most distant parts of the island.

SECTION III.

A particular Description of the City of Batavia.

THE city of Batavia is situated in the island of Java, in the latitude of six degrees south, and is the capital of the vast dominions belonging to the Dutch East India company; it also serves for the emporium, where all the riches and merchandize of that wealthy company are laid up. The Dutch having taken the town of Jacatra from the Portuguese in 1618, they soon after built there a fort in its neighbourhood, which they called Batavia; but it had

had not been long finished, when the natives, animated and assisted by the English, attacked it several times, but without success, and at last blocked it up; but the Dutch being at length succoured by a powerful Squadron from Europe, under the command of admiral Koen, the English raised the siege, and the natives were obliged to retire with the utmost precipitation.

The Dutch now considering the excellent situation of the fort, and the many advantages resulting from it, immediately resolved to build a town near it. With this view they demolished Jacatra, and upon its ruins erected the famous city which, from the name of the fort, they called Batavia. This city is encompassed by a rampart twenty-one feet thick, covered on the outside with stone, and fortified with twenty-two bastions. This rampart is surrounded by a ditch about forty-five yards broad, and the avenues to the city are defended by several forts, six of which are built with stone, and furnished with excellent brass cannon. These deserve to be particularly mentioned; they are named Ansoel, Anke, Jacatra, Ryfwick, Noordwich, and Vythock. The fort of Ansoel is seated on a river of the same name, eastward from the sea, and about twelve hundred yards from the city; it is built entirely of square stone, and is constantly provided with a strong garrison. The fort of Anke is situated on a river of the same name on the coast to the westward, and about five hundred yards from the city, and is likewise built entirely of square stone. The fort of Jacatra also lies on a river of the same name; it exactly resembles the other two forts, and is at the distance of about five hundred paces from the city, the road to which is between two rows of lofty trees regularly planted, with fine country houses, and gardens on each side. The other three forts are erected in the same manner, and of the same materials, all of them on the land side of the city, and at a small distance from it. The two first of these forts secure the city on the side of the sea, and the other four defend its entrance on the land side, and at the same time protect the houses, plantations, and gardens of the inhabitants. Thus this city can never be surprised by an enemy, since, on whatever side it should be attacked, the enemy would meet with a strong resistance. Besides, as a farther security, no person is suffered to pass beyond these forts without a passport.

The river, which still preserves its ancient name of Jacatra, passes through the midst of the city, and forms fifteen canals of running water, all faced with free-stone, and adorned with trees that are always green, and consequently afford a very agreeable prospect. Over these canals are fifty-six bridges, besides those built without the town. All the streets are perfectly straight; they are generally thirty feet broad, and the houses, which are built of stone, after the manner of those in Holland, are mostly very high. The city is about a league and a half in circumference; but the suburbs contain at least ten times as many houses as the city itself. The walls have five gates, including that of the port, near which is the barrier, which is regularly shut at nine o'clock in the evening, and is strongly guarded by a body of soldiers night and day.

The principal buildings are a very fine town-house, four churches for the use of the Calvinists, and abundance of other places of worship for persons of all religions: a spinhuys, or house of correction, in which women, who behave loosely, are confined, an orphan-house, a magazine for sea-stores, many other magazines for spices, and other public buildings.

We ought not to omit, that besides the many forts above-mentioned, there is a citadel, which is a fine regular fortification, situated at the mouth of the river facing the city, and flanked with four bastions, two of which command the sea, and the other two the town. This citadel has two great gates. On both sides of the curtain the keepers of the magazines have their lodgings, and here the governor-general of the Indies has his palace, which is built of brick, and has a noble front, after the Indian manner. Opposite to it is the palace of the director-general, who is the next person to the governor. Here also the counsellors, and other principal officers of the company have their apartments, as have likewise the physicians, the surgeon, and apothecary. It has likewise a

small church, which is remarkably neat and light. There are besides in the citadel arsenals, and magazines, furnished with ammunition for many years. In short, this citadel is the general factory, in which all the affairs of the company are transacted, and where all the archives are deposited.

In this city the Dutch have founded schools, in which the learned languages are taught, and some advances made in the liberal arts; and the inhabitants, being composed of almost every Indian nation, most of the Indian languages are spoken here; but those of the most general use are the Dutch, the Malayan, and a corrupt Portuguese.

In Batavia almost all sorts of mechanic arts flourish; for the Dutch encourage every manufacture proper for the country: they have their printing-house, paper-mills, gunpowder mills, sugar-bakers, spinners, cotton-weavers, ropemakers, carpenters, bricklayers, brasiers, and smiths, who forge all sorts of iron ware. If these workmen are inferior to the Europeans, it is chiefly where the work requires fine springs and movements, as in clocks and watches, which are hardly ever brought to a proper temper in hot countries; and even the best watches ever brought from Europe, will not go true in this climate. The very steels of their firelocks in time become soft.

Coaches are almost as common as in the great towns of Europe, and they have fine horses from Persia; the island also affords others of a small size, that are very serviceable.

S E C T. IV.

Of the Inhabitants of Batavia, with their Persons, Dress, and Employments. The Manner of Life, of the Javanese, Malaysians, Amboynese, Mardykens or Topasses, the Macassars, and Bougis, who live there; with a concise Account of the Massacre of the Chinese.

BATAVIA is not only inhabited by the Dutch, but by abundance of Portuguese, French, and other Europeans, who have settled there on account of trade. The Portuguese are principally the descendants of those who formerly lived in the island of Java, and did not chuse to remove when the coasts were reduced under the dominion of the Dutch company, and are now mostly of the reformed religion. Here is likewise a great multitude of people of different nations, as the Javanese, or natives of the country, Malaysians, Negroes, Amboynese, Armenians, natives of the isle of Baly, Mardykens, Timors, Macassars and Bougis. Nothing can be more entertaining, than to behold such a multitude of people in one city of different nations living at their own dwellings, and after their own way. One sees every moment new customs, strange manners, a variety of habits, and faces of different colours, as white, black, brown, and olive-coloured; every one living as he pleases, and speaking his own language; yet notwithstanding this variety of customs opposite to each other, a very surprising union is observable among these citizens; this is purely the effect of commerce, which, like a common soul, actuates the whole body.

With respect to liberty of conscience all the inhabitants enjoy it; but are not allowed the public exercise of their worship. Priests and monks are not permitted here, any more than in the United Provinces, to walk the streets in the habits of their respective orders; yet they are all allowed to live here, except the Jesuits, who are excluded, not on account of their religion, but for fear of their intrigues.

In order to convey a clear idea of the manner in which the people live at Batavia, we shall mention some particulars of each nation. The Javanese chiefly apply themselves to agriculture, fishing, and ship-building. They wear scarcely any other habit besides a short petticoat, that reaches to their knees, the rest of their bodies being naked, except their having a little bonnet on their heads, and a scarf across their shoulders, in which hangs a short sword. Their cabins, which are superior in neatness to those of the other Indians, are built of split bamboo, with a large spreading roof that hangs over the sides of the house, and under it they sit to take the air. Those who are established in the neighbourhood of Batavia, and in a tract about forty leagues along the mountains of Bantam, are immediately subject to the governor-general. The com-

company sends commissaries among them, who administer justice, and collect the public revenues; and the principal men among the Javanese at certain times resort to Batavia to give an account of the behaviour of these commissaries.

The Malaysians, who live at Batavia, chiefly employ themselves in fishing. Their vessels are very neat, and their sails ingeniously made of straw; but they are a most wicked and profligate people, and frequently commit murders for very trifling gains. They profess the Mahometan religion, but are entirely void of morals, and make a merit of cheating Christians. Their habits are either of silk or cotton, and the men also wear a piece of cotton cloth about their heads, with their black hair tied up in a knot behind.

The negroes at Batavia are chiefly Mahometans. Some of them work in mechanic trades, others are a kind of pedlars, but the most considerable of them trade in stone for building, which they bring from the neighbouring islands.

The Amboynese settled in this city chiefly apply themselves to building of houses with bamboos, the windows of which are made of split cane neatly wrought in different figures. They are a very bold people, and are said to be so turbulent, that they are not permitted to live in the city, but have a quarter allotted for them at some distance from it. They have a chief to whom they pay great respect, and he has a very magnificent house in their quarter, well furnished after their manner. The men wear a piece of cotton cloth round their heads, with the two corners hanging down behind; and this kind of turban they adorn with many flowers. Their arms are chiefly large sabres, and long bucklers. The women wear a habit that fits close to their bodies, and wrap a cotton mantle round their shoulders, but leave their arms naked. Their houses are built with boards, and covered with leaves; they are two or three stories high, and the ground-floors, in particular, are divided into several apartments.

The Mardykens, or Topasses, are idolaters composed of various Indian nations, and are of different trades and professions. Their merchants being furnished with passports from the company, carry on a considerable commerce in all the neighbouring islands. Some of these people are gardeners, others breed cattle, and others fowls. The men generally dress like the Dutch, but the women like the other Indians. They reside both in the city and in the country; their houses are much better than those of other Indian nations, and are usually built either of stone or brick: they are several stories high, and very neat.

There are also at Batavia some of the Macassars, so famous for their little poisoned arrows, which they blow from a trunk.

The Bougis are the inhabitants of three or four small islands near Macassar, and since the conquest of this last island have settled at Batavia. They are hardy bold fellows, on which account the company makes use of them for soldiers. Their arms are bows and arrows, sabres and bucklers. The Armenians, and some other Asiatics, who reside in Batavia, come thither merely on the account of trade, and stay no longer than their occasions call them.

The Chinese at Batavia were formerly so very numerous, that those in the city and suburbs were said to amount at least to five thousand. Most of the sugar mills in Batavia belonged to them, and the distillery of arrack was intirely in their hands. They were the carriers of Asia, and the East India company itself frequently made use of their vessels. They kept all the shops, and most of the inns in the city, and were likewise the farmers of the duties, excises, and customs. But in the year 1740, the governor being informed that the Chinese had entered into a conspiracy to exterminate the subjects of the company, he lost not a moment's time to prevent its success: they were condemned without trial, and sentenced to suffer death without being heard. The seamen were instantly landed from the fleet, and to encourage them in the bloody slaughter they were appointed to make, the plunder of the Chinese suburb was abandoned to them: animated by this reward, they fell with merciless fury on the conspirators, and cut them to pieces.

S E C T. V.

Of the two supreme Councils at Batavia, and the Tribunal of the City. Of the Power and State of the Governor; the Office and Employment of the Director-General. Of the Major-General, and the Land and Sea Forces of the Company. Of the Ecclesiastical Government of Batavia. The Regulations of the military Establishment, and the maritime Force of the Company.

THE city of Batavia, and all the dominions in the East Indies in the possession of the company, are governed by two supreme councils, both fixed in the city of Batavia, as the capital of all the countries under the company's jurisdiction. One of these is styled the council of the Indies, and the other the council of justice. To the first belong all matters of government, and the direction of public affairs, and to the latter the administration of justice in all its branches. The governor-general always presides in the first, which is usually composed of eighteen or twenty persons, styled counsellors of the Indies; but it seldom happens that they are all at Batavia at the same time, as they are usually provided with some or other of the seven governments in the company's disposal. They regularly assemble twice a-week, and upon extraordinary occasions, as often as the governor-general pleases. They deliberate on whatever relates to the interest of the company, superintend the island of Java, and issue orders and instructions to other governments, which are implicitly obeyed; and in this council all letters directed to the governor-general, or to the director, are read, and the answers agreed on by a plurality of voices.

The council of justice is composed of a president, who is usually a counsellor of the Indies, eight counsellors of justice, a fiscal or attorney-general for affairs of government, another fiscal for maritime affairs, and a secretary. All the counsellors of this college are doctors of the civil law. The first attorney-general has not only a vote, as well as the other counsellors, but has the third of all fines under an hundred florins, and a sixth part of the fines that are above that sum. It is his duty to take care that the laws are strictly observed, and to prefer informations against those who presume to violate them. The fiscal of the sea takes the same care with regard to frauds committed in commerce, acts of piracy, and whatever has a tendency to disturb the settled rules in maritime affairs.

Besides these two sovereign boards, there is the council or tribunal of the city of Batavia, composed of nine aldermen, including the president, who is always a counsellor of the Indies, and a vice-president. The bailiff of the city, and the commissary of the adjacent country, have also seats in this assembly, and, with the secretary, make up the board.

The governor-general is the head of the empire established by the company in the East Indies, and is in reality stadtholder, captain-general, and admiral. By this office he is president of the council of the Indies, in which he has two votes; he has the key of all the magazines, and directs every thing that has a relation to them: like a despotic prince he commands by his own proper authority, and every body is bound to obey him, but is liable to be removed by the directors of the company at home; and in case of treason, or other enormous crimes, the council of justice may seize his person, and call him to account. The company allow him eight hundred rix-dollars a month, and five hundred more for his table; they also pay the salaries of such as compose his household. These appointments are, however, only a small part of his revenue, the legal emoluments of his office being so great, that within two or three years he may, without oppressing the people, or burthening his conscience, raise an immense fortune.

As the governor-general is in a manner the sovereign of the countries belonging to the company, in compliance with the mode of the Indian nations, he is allowed a court, and most of the honours paid to crowned heads. Whenever he leaves his palace, in order to retire to his country-seat, he is preceded by the master of his household, at the

head of six gentlemen on horseback with a trumpet; two halbardiers on horseback go immediately before his coach. On the right he has his master of the horse at the head of six halbardiers on horseback, then follow the other coaches which carry his friends and retinue, and the whole is closed by a troop of horse, consisting of forty-eight men, commanded by a captain and three quarter-masters, and preceded by a trumpet richly clothed.

Though his office is very considerable on account of its revenues, power, and the honours annexed to it, yet it is extremely fatiguing. He is employed from morning till night in giving audience to those who have business with him, in reading of letters, and giving orders for the company's service, so that he spares only one half hour for dinner; and even while at table dispatches such affairs as are extremely pressing. He also receives all the Indian princes and their ambassadors, many of whom come every year to Batavia.

Next to the governor, the director-general has the greatest authority, and is the second person in the council of the Indies. His employment likewise demands great care and attention: he buys and sells all the commodities that enter into, or go out of the company's magazines: he orders what sort, and what quantity of each sort of goods shall be sent to Holland, or elsewhere: he has the key of all the magazines, and every officer in the company's service makes a daily report to him of the state of every thing under his charge. In short, he has the supreme direction of whatever relates to the commerce of the company, both at Batavia and in other places; and the members of all the factories belonging to the company are accountable to him for their conduct in their respective offices.

The next person in the government is the major-general, who under the governor has the command of all the forces, which throughout the Indies may be computed at twelve thousand troops, exclusive of the militia, who are also well disciplined, and amount to about one hundred thousand men. In fine, the regular military strength of the company by land and sea, officers, soldiers, and seamen included, may amount to about twenty-five thousand men kept in constant pay; and the company always keep for the support of their commerce one hundred and eighty ships, which carry from thirty to sixty guns; and in case of extremity, they are at any time able to fit out forty of a larger size.

The ecclesiastical government at Batavia is generally in the hands of eleven persons, all of whom are ministers of the reformed religion: these are five for the two Dutch churches in the city and that in the citadel, besides the minister that resides in the island of Onrust, in the mouth of the harbour of Batavia; three Portuguese ministers, and two Malaysians. The five last are Dutchmen by birth, though they preach in the Portuguese and Malayan tongues. As it is thought necessary that the state should be informed of whatever passes at the meetings of the clergy, the eleventh person is a deputy on the part of the government, who is to see that they undertake nothing prejudicial to the civil government, or inconsistent with the laws prescribed by the company.

Besides these ministers, the consistory is composed of eight elders and twenty deacons. A principal branch of their business is to send ministers into other governments, where, after a certain term of years, they are relieved, and either return to Batavia or to Holland, to enjoy in peace the fruits of their labours. In small places they have no ordinary minister, but one is regularly sent every three or four years, to baptize, marry, and administer the Lord's supper, which is the more necessary, as the synods have taken the resolution not to permit any religion but that of Calvinism to make any progress in the dominions of the East India company. Indeed the Lutherans have for a long space of time warmly solicited for a church at Batavia, but have been constantly refused, though nothing could be more just and reasonable than this request, especially in a place where Mahometans and Pagans are freely tolerated in the exercise of their religions.

This ecclesiastical council have also under them consolators of the sick, school-masters, and catechists. Of these last the company have many in their service on board their ships, who say prayers constantly every day,

and instruct such as embrace the Christian religion. These catechists are for the most part natives of the country, and as they speak several languages, are able to give necessary instructions, and to teach the confession of faith to many different nations.

In consequence of these regulations, the reformed religion makes a considerable progress, particularly among the negroes, of whom Mr. Roggewein says, he has seen one hundred and fifty at a time desire to be baptized. This request, however, is not rashly granted; for all who receive baptism must first give proof of their being well instructed, and be able to make their confession of faith. In this they are so strict, that they do not dispense with it even with respect to princes and princesses themselves.

The military establishment in the East Indies is much the same as in the United Provinces, the company's troops being as regularly paid and as well disciplined as those in Holland. The first officer in command, in time of peace, has no higher rank than that of major, under whom are captains, lieutenants, and ensigns: but when the troops are in the field, the lieutenants and ensigns are at the head of companies, the captains lead brigades, and the major, acting as major-general, commands in chief. The natives of the country are under their own officers, who are capable of rising to the rank of a captain, but no higher. The burghesses of Batavia also choose their own officers, as high as the rank of captains of horse and foot, and are under the command of a colonel, who is both one of the counsellors of the Indies, and president of the council of war.

The company's maritime force is regulated on the same maxims as their military establishment, that is, there are no officers wanting that are necessary to the preservation of good discipline, nor are any honoured with high titles merely to secure large appointments to them without any benefit to the state. The whole fleet is under the direction of a commodore, who has under him a vice-commodore. These are the only flag-officers; but every captain has the command of his ship. When their vessels are in the harbour of Batavia, the captains are obliged every morning to repair to the commodore, in order to give him an account of the state of their vessels, and to receive his orders: yet the commodore himself can do nothing of consequence without the consent and approbation of the governor-general, to whom all the officers of the company, civil, military, and marine, are accountable.

The company's ships sail from Batavia for Holland five times a year: the first squadron, which is composed of four or five sail, leaves that city in January: the second sails in March, and only consists of one ship; this vessel does not sail till the Chinese fleet, which brings the tea, is arrived, and of this the best part of the cargo of this vessel consists; whence it is called the tea-ship, but the common people give it the name of the book-ship, from its bringing the company's account of all their proceedings during the last year, by which means the directors in Holland see the state of the trade in the Indies: the third sails in July, and is composed of four or five ships, which in their passage touch at the island of Ceylon: the fourth squadron, which consists of six or seven vessels, sails in September; and the fifth, which forms a fleet of sixteen or twenty sail, leaves Batavia in the month of October. All these vessels, laden with the riches of the East, sail from the port of Batavia; the ships from Mocha, which bring home the coffee, being the only vessels in the service of the India company that are allowed to proceed directly home without going to Batavia.

S E C T. VI.

Of the other Towns in the Isle of Java, particularly Bantam, Cheribon, Japara, and Palamboan.

THE other towns in the island of Java are Bantam, Cheribon, Samarang, Japara, Roombong, Tuban, Sidaya, Jortan, and Surabaiga. These are on the north coast as well as Batavia, and at the east end of the island are the cities of Passarvan, Panarucan, and Palamboan: about the middle of the south coast is the city of Mataran, where

where the king of Mataran resides. Of these towns we have very little knowledge, except of Bantam, Cheribon, Japara, and Palamboan.

Bantam is seated in a plain at the foot of a mountain, out of which issues three rivers, or rather one river that divides itself into three branches, two of which surround the town, and the other runs through the middle of it. When this city was in its prosperous state, it was no less than twelve miles in circumference, and was very populous. It lay open towards the land, but had a very good wall to the sea fortified with bastions, and defended by a numerous artillery. The king's palace was a place of considerable strength, and there were several publick buildings and palaces of the great men that made a good figure. This was one of the greatest ports in the eastern seas, and to it many nations resorted; but it is now a poor and wretched place, without trade, for the principal inhabitants are removed.

The head of the Dutch factory at this city has the title of a chief. The Dutch have there a strong fort and a numerous garrison to keep the people in awe, who are far from being well affected to them. The king has also a fort at the distance of some hundred paces from that which belongs to the company, and a strong garrison in it for the security of his person. The bay of Bantam is very safe and pleasant, in which are many islands that still retain the names given them by the English, who had formerly a very fine factory at this place, from which they were unjustly expelled in 1683.

The only commodity of this part of the country is pepper, of which they are able annually to export ten thousand tons. The Dutch East India company oblige the king to furnish them with a certain quantity of this spice, but in all other respects treat him with great civility. This their interest obliges them to do, he being the sovereign of a great and populous country, and his subjects bold, hardy, and enterprising.

The country is very fertile, abounding in cattle, rice, and fruits; and at a considerable distance from the shore are frequently found precious stones of great value; but these seldom fall into the hands of the Dutch, the people dreading lest these should tempt them to extend their conquests, by which they are already too much oppressed.

At the distance of forty leagues from Batavia is Cheribon, where the Dutch company have a factory, the head person of which has the title of resident, and is not dependent on any governor or director, but corresponds directly with the governor-general of Batavia. The company here carry on a very advantageous commerce in cotton, indigo, cardamoms, and coffee. The land is as fertile in rice and other provisions as perhaps any country upon earth: it is of considerable extent, and the people who inhabit it are under the dominion of four great lords, who were formerly styled pangerans, or princes, but are now called sultans, or kings, though their authority is not much extended in consequence of this new title. One of them is particularly denominated the company's sultan, from his being always attached to the Dutch interest. Indeed all of them might be very properly termed the company's sultans, since they are under the protection of the Dutch, and are freed from all apprehension of their being attacked by the king of Bantam, who formerly carried on a continual war with them, and would probably have reduced them under his subjection, had not the company assisted them, and driven the Bantamese out of their territories. These princes have in return, both from gratitude for past favours, and from the expectation of being protected for the future, granted the company great privileges in their dominions, particularly that of erecting a fort at Cheribon, where they have a garrison of sixty men.

At the distance of about half a league from this fort are the tombs of the princes of Cheribon, in a vast temple, which was probably erected for that purpose: they are three stories high, and built of various kinds of fine stone. These tombs are said to contain immenſe riches; but though they are left unguarded, the princes are under no apprehensions of their being carried away, from the firm persuasion that they are protected by some spiritual beings; and they report many instances of persons who they pre-

tend dropped down dead on approaching the places where these riches are concealed, in order to carry them away.

A multitude of priests are maintained about this temple, many of whom have gone in pilgrimage to Mecca, and on that account are treated with extraordinary respect.

The whole body of this priesthood is governed by one sovereign pontiff, who is more revered than the sultans themselves.

Our author observes, that there was once a very considerable English factory at Cheribon, with a little town belonging to it; but that the persons who belonged to the factory intriguing with the wives of the natives, they were so exasperated, that they massacred them all in one night's time, and then destroyed the town.

Japara is situated at the bottom of a mountain of a moderate height, and is chiefly inhabited by the Javanese and Dutch. The port is safe and commodious, and is defended by a fort built chiefly of wood, and erected at the top of the mountain, where it commands the whole road; this is called the Invincible Mountain, because when the Portuguese were masters of the place, the Javanese were constantly defeated in their attempts to get it into their possession.

The king of Japara generally resides at a town called Kattasura, situated twenty-nine leagues up the country, where the Dutch have a strong fort and a good garrison, that serve both to secure their conquest and for a guard to the king. This prince is a mahometan, and like most eastern monarchs, is constantly served by women, of whom he takes as many as he pleases, either as wives or concubines. Some of his priests are obliged to go every year in pilgrimage to Mecca, in order to make vows for the safety and prosperity of the king and his family. His subjects are extremely faithful and devoted to his interest. The principal persons of his court, whenever they obtain an audience, approach him creeping on their knees; but this slavish custom is disused in time of war. Those who commit the slightest fault are stabbed on the spot with a little dagger; and this is almost the only punishment in use amongst them.

His subjects are fond of chewing betel. The prevailing diversion among the people is a kind of comedies. The women who act in these are very richly dressed; but the entertainment chiefly consists in singing and dancing, accompanied by their music, which is not very agreeable, at least to an European ear; for they have no other musical instrument besides a kind of little drum, which they beat very dexterously. Their dancing is generally of the grotesque kind, in which they excel; for they throw their bodies with an inexpressible agility into a variety of postures, by which they express the passions of the mind in so comical and ludicrous a manner, that it is almost impossible to avoid laughing. These Indians also practise the war-dance, in which the king and his courtiers frequently bear a part. They are likewise fond of cock-fighting, at which they lay such large sums, that they are frequently reduced to beggary.

This part of the country abounds with all the necessaries of life, particularly with horned cattle, hogs, and an amazing quantity of fowls. Nothing is scarce here but mutton. As to wild beast, they have buffaloes, stags, tygers, and the rhinoceros, which the Javanese hunt chiefly for its horn of which they make drinking-cups that are highly valued, from an opinion that they will not hold poison, but instantly break as soon as it is poured into them. The land is every where extremely fertile, producing in vast abundance pepper, ginger, cinamon, cardamoms, &c. and of late years they have planted coffee with great success. Fruit-trees grow every where, and as they are green throughout the year, and planted in rows along the riversides, there are here the most beautiful walks in the world. Sugar-canes grow very fast, and the vines bear grapes seven times a year; but they are only fit for raisins, and not for wine, because the climate ripens them too hastily.

The last city we shall mention is Palamboan, which is situated in a bay on the south-east coast of Java, opposite the isle of Bally, and near the straits of that name, in eight degrees south latitude, and in one hundred and eleven degrees thirty minutes east longitude from London. It is for many miles round encompassed by a pleasant champaign

champain country, and several small rivers fall into the sea on each side the city. As our East India ships were used sometimes to pass this way in their voyage home from Borneo, they sent their boats up these streams to bring off water and provisions; but a great surf frequently renders it troublesome watering here. The streights between Java and Bally are very difficult to strangers. In the narrowest place this channel is not much broader than the Thames, and the mountains on each side, which are of a prodigious height, and hang almost over your head, afford a dreadful prospect; while the noise made by the sea in the hollow of the rocks, and the gusts of wind coming down from the mountains, and suddenly veering round the compass, encrease the horror.

The king generally resides at Palamboan, and sometimes at a fort fifteen miles from the sea. His dominions extend from the east of Java about eighty miles along the south coast, and at the coast end, and about sixty miles from north to south, but how far it reaches up the country is unknown.

Captain Beeckman observes, that the people of Palamboan were under such consternation on his first appearing before the place, that they sent to inform the king of it, who was then up the country; but the sabander, the principal officer of the port, being a Chinese, let them know that it was an English ship, of which he was informed by the colours, and immediately their fears vanished. The king no sooner understood that the commander was an Englishman, than he invited him on shore, and the next day, seeming to place an entire confidence in him, went on board the pinnace. The king was dressed in a short black velvet waistcoat, trimmed with narrow gold lace, with a red cap on his head, and many gold and stone rings on his fingers: but his attendants were so thievish that they were obliged to watch them very closely. The English officers were afterwards entertained at the palace, which was a large square, surrounded with a pallisado, containing several apartments for the king and his women. The entertainment consisted of fowls, venison, and high-seasoned broths. When dinner was over about thirty of the king's women, each attended by a slave carrying a basket of fruit, came in, and presented it to the officers; and the quantity was so great, that there was more than the boat could carry on board at once: the king also made them a present of two oxen, three large deer, with some geese, ducks and hens, and several bags of rice.

The power of the king does not seem to be restrained by any laws: his oran cayas, or noblemen, shew him the most profound respect. His religion is pagan, as is that of most of his subjects, though here are some Mahometans among them: the Chinese have found their way thither, as well as to every other port in the Indies.

SECTION VII.

Of the small Islands near the Coast of Java; with a more particular Account of Timor, the largest and most considerable of them. Its Situation, Extent, Coast, and Climate. It is jointly possessed by the Dutch and Portuguese. Its Vegetables and Animals, with a Description of the Persons, Dress, and Manners of the Natives.

TO the northward of Java are several islands, where the English, in their voyages to Borneo, meet with very good refreshments, at a much easier rate than at Batavia. Among these are Carimon Java, which is situated between the coast of Java and Borneo; and there European ships frequently touch in their voyage to the last-mentioned island. Madura lies towards the north-east end of Java, at the bottom of the great bay. A little to the eastward of Java lies the island of Bally, or Lesser Java; and farther to the eastward Lomboy, Combava, Flores, Solor, Timor, and several others; in most of which the Dutch have forts and settlements, and take the liberty of governing and even transplanting the natives whenever they please: from hence they also frequently recruit their troops, and thus make one nation of Indians contribute to keep another in subjection.

Timor is the largest and most considerable of these islands, and its natives resembling the rest in their persons and manners, a description of this island will give the reader a sufficient idea of the rest.

The island of Timor extends nearly north-east and south-west; the middle of it being in nine degrees south latitude, and in one hundred and twenty-four degrees longitude from London. It is near two hundred miles long, and generally fifty broad; and has no navigable river, nor any harbours, but many bays, in which ships, at certain seasons of the year, may safely ride at anchor. The shore is very bold and free from rocks, islands, or shoals, except a few which are visible, and therefore easily avoided. The lands are low for about three or four miles up into the country; but then the hills begin to rise. Near the sea the land is sandy, and covered with tall straight-bodied trees; and from thence to the mountains there is a tract of marshy ground, over-run with reeds and red mangroves, and overflowed at every tide; the tops and sides of the mountains are clothed with woods, intermixed with pasture-groves, and the country is pretty well watered with springs and small rivers.

The safest riding for ships is in the bay of Babas, about five leagues from the fort of Concordia, where they are defended by the land from west-and-by-south to the east-north-east, which is of the greatest advantage, as no other winds blow with any violence: but here the worms will speedily destroy a ship, if the utmost care be not taken to prevent this misfortune.

The seasons here resemble those of the other parts of India in the southern latitude: fair weather begins in April or May, and continues till September or October, when these parts begin to be visited with storms and tornadoes; but the worst weather is in the middle of December, when the wind blows from the west, or north-west, with such violence, that in the seas which wash the northern shores there is no bearing up against it; and these winds are attended with heavy rains till the middle of February, when they begin to abate; and about the end of April, or the beginning of May, the easterly monsoon and fair weather are generally settled. But though the year is divided into the eastern and western monsoons, when the weather is fair, there are every day sea and land breezes near the shore, with which a ship may sail either east or west.

About a league from the south-east point of the island is the small fort of Concordia, situated upon a solid rock close by the sea. On the east side of which is a small river of fresh water, over which there is a broad boarded bridge, near the entrance into the fort, about one hundred yards from the sea-side, and as many from the fort. The company, as at most of their forts, have a fine garden, surrounded with a good stone wall, in which there is plenty of sallads, cabbages, and roots for the kitchen, and a parterre. In another part of it are fruit-trees, as jakas, pumpkenoses, oranges, and sweet-lemons, musk and water-melons, pine-apples, pomecitrons, and pomegranates; and by the walls are cocoa-nuts and toddy-trees in great plenty. Between this garden and the river there is a kind of paddock for black cattle, which are very numerous. Beyond the company's ground is a small town, in which the natives have about sixty houses.

On the north coast, about fifty miles to the eastward of the above fort, is Laphao, a Portuguese settlement; the people there speak Portuguese, but have been so intermixed with the natives by intermarriages, that they can scarcely be distinguished from them: though they are proud of being called Portuguese, and have embraced the Romish religion, they seem to have withdrawn themselves from the Portuguese government, refusing to submit to the governors sent from Goa. They have no place of strength, yet their government extends much farther into the country than that of the Dutch, they being in a manner incorporated with the original natives, many of whom are of the same religion: but in other parts of the island Paganism and Mahometanism still prevail, and there the people generally side with the Dutch against the Portuguese.

Laphao is situated by the sea-side, and only consists of about forty or fifty low houses covered with palm-leaf leaves, and a small church built up with boards. In a little shed are six old

old iron guns on a decayed platform, which would contribute but little to their defence, their greatest strength consisting in the numbers they are capable of assembling from the country. Some Chinese live there, and, as the junks of that country annually visit Laphao, it has the best trade of any place in the island, except Porto Nova, which is situated at the east end. There the principal Portuguese governor resides, who, it is said, can assemble, in twenty-four hours time, five hundred men armed with firelocks. But both this town and the Dutch town of Concordia have been plundered and burnt by a pirate.

The island is divided into many kingdoms, which speak different languages, though in their customs and manner of living, as well as in their shape and colour, they seem to be originally of one descent. The chief of these kingdoms are Amaby, Lortiby, Pobumby, and Namquimal; each of which has a sovereign, who has several rajas under him, and other inferior officers. These princes are, for the most part, enemies to each other, and their enmity is fomented and kept up by the Dutch.

They have several sorts of trees fit for building, though none of them are like ours; one of them grows by the sea-side, and resembles a pine; it is a hard, ponderous, reddish wood, and is very good timber. This island also produces palms of several kinds, one of them seven or eight feet in circumference, with branches only at the top like the cocoa-tree; the fruit also resembles the cocoa-nut, but is no bigger than a hen's egg, and contains no water. There is another palm as large as the former; but though it bears several bushels of small fruit, which hang on the branches, this tree has no leaves, or any thing green about it. There are also large groves of the common cocoa-trees, which, as hath been already observed, are of the greatest advantage to the people of India.

In this island are cotton-trees, sandal-wood, with which most of the neighbouring islands abound; calabashes, wild tamarinds, wild fig-trees, pine-apples, jakas, oranges, lemons, limes, mangoes, plantains, pomegranates, and several other Indian fruits, most of which are ripe in September and October.

Several kinds of good eating-herbs grow wild in the island, particularly one that eats like spinach; and purslain grows wild in the fields.

Buffaloes and wild boars abound in the island; and both the Dutch and Portuguese breed horses, oxen, goats, and sheep; but the latter neither increase nor thrive so well as in colder climates. Here are likewise monkeys, lizards, and guanoes, serpents of various kinds, scorpions, centipedes, and a multitude of insects.

The woods abound with poultry that run wild, eagles, hawks, parrots, paraquets, cockatoes, turtle-doves, pigeons, crows, and a great variety of small birds that have a gay plumage; and some of them, it is said, have very musical notes, which is pretty singular in this part of the world, where the bright colours of the birds please the eye more than the notes do the ear.

One of the small birds is called by our travellers the ringing-bird, for he has six notes which he generally repeats twice, beginning with the highest and ending very low; he is about the size of a lark, but his wings are blue, and his head and breast of a palish red.

Their tame fowls are common poultry, geese, and ducks; but the two last have been brought thither by the Europeans, and are not very plentiful.

The woods contain great numbers of bees, which produce a considerable quantity of wax and honey.

They have great plenty of sea and river fish, and, besides many unknown to us, have mackerel, breams, mullets, snooks, conger eels, rock-fish, several kinds of oysters, some of which are very large; cockles of an extraordinary size, turtle, shrimps, prawns, and craw-fish. In the bays and rivulets are some alligators.

The natives are of so swarthy a complexion, that the Europeans frequently call them black; they have long black hair, and are of a middle stature, straight-bodied, with slender limbs, and a long visage. It is said that those who are independent of the Dutch and Portuguese are very inhospitable to strangers, and cut off any Europeans that land upon the coast whenever they have an opportunity; but they have probably had sufficient provocation from the Portuguese and Dutch, who are too apt to treat the Indians with great insolence, and sometimes barbarity, when they fall into their hands.

The only cloathing of the natives is a little cloth tied round their loins, which being brought up between their legs and fastened before, just hides their nakedness. Their greatest finery consists in a sort of coronet of mother of pearl, or thin plates of silver or gold scalloped or indented on the edges, of the breadth of a crown piece, and of an oval form. Three or four of these on the forehead make a mighty glittering show; but most of the people wear caps of palm-leaf, made up in several forms.

They always go armed with swords, darts, and lances; with these they hunt the wild buffaloes, which they run down, and then strike them with their darts, as they do also fish in the water.

Whether they take flesh or fish, they make a fire and dry it upon a kind of wooden gridiron, in order that it may keep, for they generally continue their sport two or three days.

No man has any other property in the land than what he gains by cultivating it, for whoever clears a piece of ground is for that year considered as the proprietor; for they seldom plant their Indian corn twice in the same place. They burn the grass and shrubs upon any spot of ground they think fit for their purpose, and thus prepare it against the wet season: they however live chiefly by hunting and upon their fruits, and do not care to take the pains to sow much corn; so that among them land is of little value.

The common languages spoken here are the Malayan and a bastard Portuguese. The natives, however, have a language peculiar to themselves.

They are not much acquainted with arts and sciences, nor would artists and mechanics be of any great use among them, the materials and implements they employ in cloathing and building being of small value. These are supplied by the Chinese, who bring hither coarse rice, coarse or mixed gold, tea, iron-work, porcelain, and silk both wrought and raw: in exchange for which they have gold which is gathered here, bees-wax, and sandal-wood. It is said that about twenty small Chinese vessels come hither every year from Macao, and commonly one vessel a year from Goa, which brings European commodities, callicoes, and muslins. Here are also some barks that trade from this place to Batavia, and bring from thence both European and Indian goods, and particularly rice. The vessels generally come hither in March, and stay till September, by which means they secure the benefit of the trade-winds, and obtain regular and advantageous markets for their commodities.

C H A P. XII.

Of the Island of BORNEO.

S E C T. I.

Its Situation, Extent, Climate, and the Face of the Country.

BORNEO, the largest of the Sunda Islands, is of great extent, reaching from seven degrees thirty minutes north to four degrees south latitude, and from the hundred and seventh to the hundred and seventeenth degree of longitude, and is about seven hundred miles in length, five hundred in breadth, and is supposed to be eighteen hundred miles in circumference. To the eastward lies the island of Celebes, to the north-east the Philippine Islands, to the south the island of Java, and to the west the island of Sumatra.

The air of the country is not so excessive hot as might be expected from its being situated under the line, for it is almost every day refreshed with showers and cool breezes. Those parts of the island which border on the sea-coast form a flat plain for several hundred miles, and are annually overflowed. Upon the retiring of the waters the whole surface of the ground is covered with mud, and the sun darting its rays perpendicularly upon it, raises noisome fogs that are not dispersed till nine or ten in the morning, and render those parts of the island very unwholesome. The multitude of frogs and reptiles which, when the water is dried up, is left behind, being soon killed by the heat of the sun, cause, at that time of the year, an intolerable stench, which serves to corrupt the air. If we add to all this the cold chilling winds and damps that succeed the hottest days, it is easy to conclude, that this place must be extremely unhealthful, at least to European constitutions: but the gold and precious stones which abound here, make our adventurer slight death in every form rather than not possess them.

The monsoons, or periodical winds, are westerly from September to April, or thereabout. This is their wet season, when heavy rains continually pour down, intermixed with violent storms of thunder and lightning; and at this season there are seldom two hours together fair weather on the south coast of the island, to which the Europeans chiefly resort. The dry season usually begins in April, and continues till September; and even in this part of the year, they seldom fail of having a shower every day when the sea-breeze comes in.

The river of Banjar is, towards its mouth, twice as broad as the Thames at Gravesend; and the banks, being planted with thick groves of ever-greens, render the passage up this river extremely pleasant. A little within its entrance are three islands, the first of which, being covered with trees of a prodigious height, may be seen off at sea, and serve for a land-mark to sail over the bar. At the north and south ends are large sand-banks, which are very dangerous; and the vast floats of trees that are perpetually driving down the stream, increase the danger. The best place to anchor in is a mile or two within the river's mouth; at a small distance from it, it is joined by the China river, which is thus named from the China junks constantly sailing up it.

The tides here rise about twelve feet, and never flow more than once in twenty-four hours, and that always in the day-time: for during the night the water never rises above half a foot, except in an extraordinary dry season. This proceeds from the strength of the torrents and the violence of the land winds, which blow much stronger in the night than in the day.

The harbours to which the Europeans usually resort are Banjar Maseen, Succadana, and Borneo; but they come much oftener to the first than to either of the other, on account of the great quantities of pepper that grow near the source of that river, which discharges itself into the sea in three degrees eighteen minutes south latitude.

The inland part of the country is dry and mountainous; but upon the south coasts, for a hundred miles one way, and two hundred another, the land is a stinking morass; yet is covered with woods of very tall trees: this part of the country is intirely overflowed in the rainy season, and the other coasts are not much better. These inundations, though prejudicial to health, may be of service to the inhabitants in securing them from invasion.

In the fair season the grounds about fifty or sixty miles up the country become dry, and herds of cattle are seen grazing upon the banks of the rivers; for the grass grows there to a very great height: but when the rains return, all the cattle are forced up to the hills, and the flat country becomes again a great watery grove. In the country are mines of iron and tin, and very good lead-stone; the mountains also abound in gold, some of which is very fine.

S E C T. II.

Of the Vegetables and Animals of Borneo; with a particular Account of the Ouran-outang, or Man of the Woods.

BESIDES rice, which is the only grain eat by the inhabitants, the country affords plenty of lemons, oranges, pine-apples, citrons, cocoa-nuts, plantains, melons, bananas, and all other Indian fruits. They have also a great deal of very fine timber, with the cotton shrub, canes, and rattans; but foreigners chiefly resort to this island for its pepper.

Of the black-pepper are three sorts found in Borneo; the first, called molucca, or lout-pepper, is the best; the second, named caytongee-pepper, is a middling sort; and the third, and worst sort, is negaree-pepper, of which they have the greatest quantity, but it is small, hollow, and light, and usually full of dust; it should therefore be bought by weight, and not by measure. Here is also white-pepper, which is sold at double the price of the black.

The animals of the greatest use in this country are elephants, horses, which are of a small size, oxen, buffaloes, deer, and goats. There are here several kinds of wild beasts, as bears, tygers, and monkeys; of the last there are vast numbers, and a very great variety: but the ouran-outang, or man of the woods, is the most remarkable; he is said to be no less than six feet high, when full grown, and walks upright like a man. His arms are somewhat longer than those of the human species. He has no tail, nor any hair on his body, except where it is found on man's. He is very strong and nimble, and will throw stones, or any thing else that come in his way, at those who provoke him. Captain Beeckman says, he bought one of them, and that he was so fond of spirituous liquors, that he would drink heartily of punch, if he was left in the cabin with a bowl of it upon the table; and that he would open his case, and take a bottle of brandy, and having drank a considerable quantity, would return the bottle to its place. If the captain was angry with him he would sigh and whine, till he was reconciled: he also slept like a man, with one arm under his head; but though he was not twelve months old when he died, he was stronger than any man in the ship.

This island has scarce any of the birds that breed in Europe, except the sparrow; but there are parrots and parroquets of all sizes, among which the luree is by far the most beautiful: he is of the size of a common parrot, but his feathers are of a lively red, intermixed with blue and green, and so finely shaded as not to be imitated by the pencil. These birds are more easily taught than any kind of parrots, and, even in the country, cost two or three guineas a piece. They are frequently purchased by

the European captains; but commonly die in their voyage upon entering a cold climate.

They have here very large bats, or, as some people call them, flying-cats; the body in colour, shape, and smell, resembles that of a fox, but is not so large; but the wings are of so prodigious a size, that, when extended, the distance from the tip of one to that of the other is said to be no less than five or six feet. During the western monsoon they fly from west to east for two or three hours every evening in such multitudes, that they darken the sky.

This island has also great plenty of sea and river-fish, some of which are well known in Europe. They have also many others to which we are strangers, particularly a fish called the cockup, which is not inferior in taste to any of ours. The natives are very fond of the cat-fish; but it is seldom eaten by the Europeans. Their heads are large, and are said to have some resemblance to the head of a cat: these fish are sometimes five or six feet long, but have no scales. In the river of Banjar they have prawns six or eight inches in length, and rock-oysters of a very large size.

The musketoes are intolerably troublesome, and so venomous that when foreigners first come to this island, their faces are so swelled by their bite, that a man can hardly know his most intimate acquaintance; but, after they have been there some time, their bite has not this effect.

SECT. III.

A general Character of the Natives: their Persons, Dress, Manners, Customs, Religion, Marriages, and Funerals: their superstitious Method of treating the Sick, and their little Skill in Navigation.

THE people of the island are divided into Mahometans and Pagans: the Mahometans, who are called Banjareens, inhabit the sea-coast and all the principal towns of trade; and the Pagans, who are called Byayos, possess the inland country, and are represented by the Mahometans as barbarians; while the popish missionaries, who have made some progress in their conversion, say, that they are more tractable and ready to embrace Christianity than the Moors. Indeed it is not extraordinary that two nations inhabiting one island, and differing so widely in their manners as well as religion, should represent each other as barbarians, how peaceable or polite soever they may appear to foreigners who have not their prejudices.

The Byayos, who are descended from the original inhabitants, and dwell in the woods and mountains in the inland part of the country, apply themselves but little to trade or merchandize, or to promote the arts and sciences. Being a robust war-like people, they spend their time chiefly in hunting and attending their cattle; but have little commerce with foreigners, which renders it difficult to give a particular description of them: but probably were we to become better acquainted with them, all the accounts that have been given of their barbarity would vanish, and we should only find that, like the rest of mankind who live in woods and forests, they are a little rough and unpolished, but perhaps more sincere and generous than their more civilized neighbours, whose conversation with the Chinese merchants seems only to have rendered them more expert in the art of cheating.

The Banjareens have long shining black hair, and are well proportioned, but low of stature, and their features are not very engaging. The women are little and ill shaped, and their features and complexion much better than those of the men. They have a very engaging mien, and few people move with a better grace. All the natives of Borneo are extremely swarthy, like the other people who live under the equinoctial, whence some travellers call them blacks; but there is a considerable difference between their complexion and that of the negroes; for it is not the heat of the climate alone that makes men black; for that only renders them tawny.

The Byayos who dwell in the mountains are much taller and stronger bodied than the Banjareens, which may be ascribed both to their situation and their way of life, they being inured to hardship and fatigues, and constantly following

the chase; while the people of the flat country use hardly any other exercise besides rowing, and are so little used to ride or walk, that they are said to do both very awkwardly: they even take but little pains in fishing, for by once casting a net before their own doors, they take as many fish as they know what to do with in a whole day; and as they find little difficulty in obtaining food for the subsistence of their family, they are generally very indolent.

We don't find that the Byayos have any other cloathing than a piece of cloth wrapped round their waists; they paint their bodies indeed of a blueish colour, which at a distance has some resemblance to cloathing, and generally smear themselves with stinking oil, which, added to the steams of their bodies in this hot climate, is sufficient to stifle an European who happens to be in a crowd of them. Yet among these people vanity has a sufficient power, for so prevalent is the force of custom and fashion, that there is scarce a considerable man among the Byayos who does not distinguish himself from the vulgar, by pulling out his fore-teeth to put others made of gold in their room; and their greatest ornament is a string of tyger's teeth hung about their necks like an alderman's gold chain.

Among the Banjareens the common people are not much better clothed than the Byayos; but their princes and great men usually wear a kind of close vest of blue or red silk, and sometimes of European cloth, over which they throw a loose piece of silk that wraps once or twice about them, and reaches down to their knees; they also wear a pair of drawers, but they have no shirt, and their legs and feet are always bare. Their hair is tied up in a roll in the back part of their heads, about which they tie a piece of muslin or calicoe, which is not near large enough for a turban. A dagger, which they wear in a scabbard on the left side, is always part of their dress.

The Banjareens live in a friendly hospitable manner, their houses being always open for the reception of their friends. Their food chiefly consists of venison, fowls, fish, boiled rice, and hard eggs, which at the houses of the great are served up in gold and silver dishes or bowls; and those of inferior rank use vessels of brass or earthenware. They sit at their meals cross-legged on mats, and are seldom seen in any other posture. They usually drink water or tea; but though their religion prohibits their tasting strong liquors, few of them will refuse wine or arrack, when they are among the Europeans, and then they will drink as freely as they.

Almost all the day long they have small tables by them of the size and shape of a tea-board, on which stands their betel and areka in vessels of gold, silver, or brass; the table itself being of the same metal according to the quality of the owner: these they chew perpetually, unless when they are eating, or smoking tobacco, of which both the men and women are very fond, and their tobacco is usually mixed with opium. The master of the house generally lights the pipe first, for they use but one at an entertainment, and after he has smoked two or three whiffs, gives it the person who sits next him, and he to a third; till it has gone round the company, who sit cross-legged in a ring upon mats. When they have continued smoking for some time, they grow exceeding chearful, but if they continue too long at it, they become mad or stupid.

The Banjareens are generally quick of apprehension, extremely inquisitive, and learn any thing with great ease. They are of a very peaceable disposition, and seldom quarrel among themselves; but when they are thoroughly provoked, their revenge will be satisfied with nothing less than the life of an enemy, which they always take in a private manner.

Their usual way of salutation is by joining their hands, raising them towards their breast or head, and gently bowing; but when they appear before the great, they lift their joined hands to their foreheads, falling down on the knees and faces; if it be before a prince, they do this at a considerable distance, then creep towards him, and after they have received an answer retire in the same manner.

They amuse themselves with dancing and comedies, like the other eastern nations. The Chinese have likewise taught them gaming. Their more manly diversions are shooting at a mark, and hunting, which, as they manage it, requires but little labour, for the game being roused, they

they soon surround the poor animal, and dispatch him with a multitude of wounds, every man darting his spear at him, and some of them even after he is dead, to entitle them to a share of the honour acquired by his fall.

The Banjareens chiefly travel in covered boats, and in the night-time, to enjoy the cool air: these vessels being made very sharp and narrow, sail with amazing swiftness. The great men on shore ride on elephants, and some on horses; but the common people, for the most part, travel on foot.

The religion of the people of the inland country is paganism; but the inhabitants of all the sea-coast are Mahometans, and descended from colonies which transported themselves from Persia, Arabia, and Africa, about four hundred years ago, to the oriental islands, to which they were invited by the spices, and other rich merchandizes, for which the east had for many ages been famous. They are extremely superstitious, and have a way of charming diseases by making a small boat, and filling it with various kinds of provisions, of which they make an offering to the incensed demon; then launching the little vessel, suffer it to drive down the stream, imagining that all the infirmities of the sick man will be carried off in the devoted boat; and should any one presume to take it up, they believe the demon to whom it is dedicated, will either instantly strike him dead, or at least transfer to him the disease of the sick.

These demons they pretend to have seen under various forms; but if an European desires to bear them company, when they expect to meet them, they pretend that they are afraid of incurring their displeasure. It is probable they are themselves deceived by the artifices of their priests, or by some natural phenomenon; for if they are asked in what manner these demons appear, they sometimes answer, like a distant fire in the night, and usually in meadows, and low grounds, which seems to be no more than an ignis fatuus.

They frequently marry their daughters at eight or nine years of age, and they have children soon after; but they are usually past bearing at twenty-five. Fornication is not accounted any great crime, nor is it any objection to a woman that she has had a gallant before hand: for whatsoever has been their conduct before marriage, they are said to be very faithful to their husbands. The Mahometans of this island use much ceremony in their marriages, of which we shall give a particular account from Mr. Bceckman, who was present at one of them.

All the partitions of a large house being taken down, it was laid into one room, the floor of which was covered with fine mats, and at the upper end was a sofa, over which was a large canopy, and on the floor were cushions and pillows to lean upon. The night before the wedding, people beat continually on their gongs or brazen drums, and sounded their country pipes and trumpets, which made very harsh music; while others jingled chains, and beat upon brass or iron utensils.

The next morning flags and streamers were hung about the door of the house, and all the vessels in the river put out their colours, and were continually firing their guns; several people were also planted about the house, who were continually shouting and firing guns.

A great number of people were invited, and in the middle of the afternoon a handsome dinner was served up, and the company having eaten plentifully, each person had a basket given him to carry home the remainder of the provisions that were left. After which betel, areka, and opium, were served round, which had the same effect upon them as strong liquor has upon us.

Towards the evening a large float of timber came driving down the river, on which was a pageant made in the form of a ship of about two hundred tons burden, in the middle of the quarter deck appeared the bridegroom seated on a throne. The machine stopped at a house where the bride was, and twelve young virgins descended from it, each with a large bowl of gold, silver, or brass, in which were the presents made by the bridegroom to his bride, who sat on a throne to receive them, and in return made presents to the bridegroom.

At length the bridegroom coming to the door of the house was met by a priest, who having repeated some words, strewed rice upon his head, as an omen of his fu-

ture plenty, at which the people shouted, and fired a volley of small shot: he being then led to the bride, was seated on her right hand, and soon after the company withdrawing, they were left alone.

As their state and grandeur principally consists in the number of their wives and concubines, when one of them dies, or is divorced, which frequently happens, the husband immediately provides another, and let him be ever so old, he chuses one as young and beautiful as he can possibly obtain. They here purchase their wives as in other eastern countries; whence a man's daughters, if they are tolerably handsome, are esteemed a part of his treasure, otherwise they remain a burthen to the family.

The funerals of the Mahometans are here solemnized in much the same manner as in other countries, where that religion prevails; only they practise some pagan customs, as burying several necessaries with them, which it is supposed may be of use to the deceased in the other world. The mourners are clothed in white, as in Japan, and China, and the people who attend their friend to the grave generally carry lighted torches in their hands. Their burying-places are always out of the reach of the floods, and the head of the corpse is constantly placed to the north.

They have no mechanics among them, except goldsmiths and carpenters; but every man has a knack at carving, and will carve the head of a cane or dagger very neatly, without any other tool but an ordinary knife.

They have very little skill in physic, and are amazed that any one should suffer himself to be let blood, and willingly part with what they call his life. They impute most distempers to the malice of some evil spirit, especially if a person be delirious, and rambles in his discourse. In this case, instead of having recourse to medicine, they usually prepare a handsome entertainment of fowls, rice, and other provisions, which they carry into the fields, and place under a certain tree, where a small oratory is erected: they offer their meats with prayers for the health of the sick, and if he recovers, they seldom fail to bring another offering, and return their thanks for his being restored to health; but if the sick man dies, they express their resentment against the angry demon, whom they imagine to be the occasion of his death.

They have but little skill in navigation, they make no distant voyages, and indeed have not any vessels of force or bulk. Their small boats or flying proas are their most remarkable vessels, and these are here formed of the body of a tall tree, hollowed, and made sharp at both ends. They have neither keel nor rudder, but are steered with a long narrow paddle. Some of these boats are thirty feet long, and only two feet wide, and the seats for their rowers are laid across the boat. They have also out-layers, somewhat like those we have described in the account we have given of the proas of the Ladrone islands.

The Banjareens and other Moors, who inhabit the coasts, speak the Malayan tongue; but the people of the inland country have a language peculiar to themselves:

SECTION IV.

Of their Manner of Building their Towns, and a Description of an Entertainment given by the Sultan of Caytongee.

THE towns to which the Europeans trade, are, for the most part, built upon great bundles of bamboo, and sometimes on floats of timber, but little larger than the extent of each house: the weight of the superstructure being so inconsiderable, that a part of the floats remain above the surface of the water. Upon these floats joists are laid, and upon them a floor of split bamboo. The walls are made of the same materials as the floor, and raised to the height of six or eight feet, and upon them is built a light sloping roof, like a barn, covered with palm-leaf leaves. The building is divided into rooms by partitions made of splintered cane, or bamboo, and the floors covered with a pretty kind of matting. These buildings are ranged in a line on each side the river, and form a regular street, and to prevent their being carried away by the stream, posts are driven down at the corners of each building, to which the structure is fastened by rings made of rattans, which

which do not hinder their rising and falling with the tide; but some have flat rattan cables with which they are fast moored to the trees on shore. Behind the street, upon the oozy bank, usually stand rows of houses built on pillars, and inhabited by the people in affluent circumstances. From these houses on the pillars, to those built in the river, are laid timbers, on which people walk from one to the other.

One of the most considerable inland towns is named Catongee, the sultan of which is said to be the most potent prince in the island. This city is about one hundred miles up the river Banjar.

Before the palace of the sultan of that town is a building, which consists of one large room, in which the councils are held, and foreigners entertained. It is erected on pillars seven or eight feet above the ground, and is open on all sides, but covered with a roof. This room is about fifty yards long, and thirty broad. In the middle is the sultan's throne, which is a wooden chair gilt, over which is a large canopy of gold and silver brocade. About the room are planted seven or eight great guns, ill mounted on broken carriages; but serve neither for ornament, nor defence.

At Matapoor, which is situated about ten miles from Catongee, in a part of the country that is never overflowed, is the palace of the prince of Negaree, who has a handsome armory erected before the gates of his palace, in which are deposited a considerable number of fire-arms, and several guns; but they make little use of them.

This island is divided into several petty kingdoms, besides those already mentioned; and when any prince becomes more powerful than the rest, he frequently brings his neighbour into a state of dependance, and sometimes obtains the name of sultan, or king of the whole island. The inhabitants of the mountains are, however, not subject to any of the Moorish sultans, but are divided into numerous clans under their respective heads; but their manner of government is little known to any Europeans, we shall therefore confine our lives to the princes of the Mahometan religion, with whom our merchants sometimes converse.

Whoever has any affairs to transact with the sovereigns of this country, ought never to come empty handed, for they will seldom suffer any foreigner to approach them till they are informed of the value of his presents, and then they will treat him accordingly.

We are informed by captain Beeckman, that when he had an audience of the sultan Caytongee, the prince of Negaree introduced him into the council-chamber, where he was directed to sit cross-legged on a carpet about ten or twelve feet from the throne which was erected in the midst of the room. Soon after the sultan entered in a kind of vest, with drawers something like those of our ropedancers: he had also scarlet stockings and slippers, and over all a loose gown wrought with gold and silver; and in his girdle a dagger, richly set with diamonds. Before him were carried in arms two beautiful children, one clothed in scarlet, and the other in rich yellow silk, with turbans on their heads, guarded by twelve men armed with blunderbusses and muskets; besides twelve more armed with sampits, or the trunks through which they shoot their poisoned darts, with bayonets fixed at the end of their sampits, and daggers in their girdles.

Upon the king's entering the hall of audience, the Englishmen instantly rose up to do him honour, which it seems was the greatest affront they could have offered him; but their ignorance was their excuse. His subjects, on the contrary, lifting their hands to their heads as they sat cross-legged, fell down on their faces. The sultan sat silent a few minutes, steadily viewing the English gentlemen, then thanked them for their present, and had them welcome, telling them he hoped they were well used by his subjects. He also enquired whether their ships belonged to the company, which they denied, from the apprehension that if they acknowledged they were, they should be ill-treated on that account; for he had before thought himself ill-treated by the company's factors, and therefore expressed his resentment on that account.

They were afterwards entertained in the sultan's palace: the dishes were of gold, silver, and brass, set upon a carpet without any linen. They had above fifty dishes of

boiled and broiled fowls, strong broth made of fish and flesh, rice coloured with turmeric, hard eggs, the flesh of buffaloes, and venison, which last was excellent and well dressed; but the prince, being a strict observer of the law of Mahomet, treated them with no other liquor but water. During dinner-time the king's music played, and sometimes the English trumpets, with which he was highly pleased; and after dinner little tables of betel and areka were, as usual, brought in.

At length the sultan, ordering the music to play, made a sign to an old woman who sat behind with a white wand in her hand, and who immediately striking the floor, there instantly appeared four beautiful girls of about seventeen years of age, with golden coronets on their heads, and their hair falling gracefully with a seeming negligence on their shoulders. Their arms, legs, and feet were bare, but painted of a light yellow, only on their wrists and ancles they had bracelets of gold: one of them was taller and more richly dressed than the rest, and seemed to represent some princefs. At their first entering the room they prostrated themselves on their faces three times before the throne, after which they arose and fell into a kind of dance, which chiefly consisted in twisting their bodies into antic or lascivious postures; but they seldom moved their feet from the floor. This diversion lasted about half an hour, when having again prostrated themselves three times before the sultan, they withdrew.

SECT. V.

The Chinese alone keep Shops at Borneo. The Goods proper to be carried thither; and such as may with most Advantage be purchased in that Island. Their Weights and Measures, and the Money current there.

THE Chinese are the only people in this island who retail goods and keep shops: these are chiefly furnished with China and Japan-ware, tea, silks, chints, calicoes, betel, and drugs.

The goods proper to be carried thither, besides dollars, are guns from one to two hundred weight, blunderbusses, small-arms with brass mounting, ordinary horse-pistols, gun-powder, knives, and other cutlery-wares, except forks, which are never used here. Iron and steel bars, hangers, the smallest sort of spike nails, twenty-penny-nails, grapplings of about forty pounds weight, sheet-lead, showy calimancoes, and leather boots, clock-work, looking-glasses, and spectacles.

Pepper is the principal commodity exported from thence, and turns to the best account. Diamonds may also be bought to advantage, but they are seldom to be met with at the port of Banjar above three carats weight. Gold is purchased here by giving a certain number of silver dollars for the weight of one dollar in gold. If the natives offer gold in bars, they ought to be cut half through, and then broke and touched; for they will sometimes so artfully cover a base metal with gold, that if it be cut through with a chisel, it will draw the gold over it, and the fraud remain undiscovered.

The dragons blood produced in this country is the finest in the world. This is a gum that issues from a tree that bears fruit as red as a cherry. That gum which appears of the brightest colour, after its being rubbed on paper, is the best. The country people expose it to sale in drops of about an inch long, every piece being wrapt up in leaves; but the buyer ought to insist upon having it without them, if he would avoid being imposed on. The best is sold at about forty dollars the pecul.

Jambee canes are sold for four dollars a hundred.

Their fine monkey-bezoar is sold for about five times its weight in silver, and the best is of a greenish colour. These stones are from a penny-weight to an ounce, and sometimes more, but the largest are thought to be goat-bezoar. The natives make a compound, which so nearly resembles the right bezoar-stone, that it is difficult to distinguish them. The way to discover whether there be any fraud, is by rubbing white-lead, lime, or chalk on white paper, and afterwards rubbing the bezoar upon it; and, if it be right, it will give the white-lead or chalk a greenish cast. The best unrefined camphire is also said to be produced in this country. Their

Their bird-nests are also esteemed excellent, and are sold for ninety or a hundred dollars the pecul; those that are white and clean are esteemed the best. They are particularly purchased by the votaries of Venus, who imagine that this food inspires them with fresh vigour.

Before we conclude this section, it is proper to observe, that if they barter with you, there is no relying either on their samples or their weights; but every thing must be thoroughly examined; for the Chinese have taught them to be sharpers, and they are grown almost as expert as their masters: nor do they reckon it any disgrace if they are detected in attempting to over-reach those who deal with them.

Their usual measure is the ganton, which contains about a Winchester gallon.

Their weights are the cattee and the pecul. The former is about twenty-two ounces, and therefore a hundred cattees make one pecul, or one hundred thirty-two pounds averdupoise weight. Their lesser weights are the tical, the mas, the tela, and the mataboorong: three mataboorongs make one tela, six telas one mas, sixteen mases one tical, and one tical an ounce and eight penny-weights Troy.

The only money current amongst them are dollars, half dollars, and quarter dollars, except their cash, which consists of rings of base metal strung, which serve them in purchasing things of little value.

CH A P. XII.

Of the Island of SUMATRA.

SECT. I.

Its Situation, Extent, and Climate. Its Mountains and Minerals.

THE island of Sumatra is long and narrow, stretching in a straight line from the north-west to the south-east, extending from five degrees thirty minutes north latitude to five degrees south, and from the ninety-third to the hundred and fourth degree of longitude from London, and is about nine hundred miles in length; but is only from a hundred to a hundred and fifty in breadth, the south-east part of the island being the broadest. On the north-east lies the peninsula of Malacca, from which this island is about eight leagues distant. Java lies on the south-east, and is separated from this island by the straits of Sunda, and to the westward it is bounded by the Great Ocean.

The air of this island is very unwholesome, but is not so hot as some countries at a distance from the line. This is attributed to the cool breezes that blow from the sea, which must produce more sensible effects on account of the narrowness of the island. It may be added, that naturally the air is not so warm in countries under the line, and a little on each side of it, as in those which lie towards the tropics; because in the last the sun in summer stays longer above the horizon, and the days are longer than the nights; but here the days and nights being equal, the sun always rising at six in the morning, and setting at six in the evening, without any sensible difference, the heat of the air and the earth caused by the sun in the day, is cooled by the length of the night. The monsoons are much the same as in the other countries we have last described, only the rains begin something sooner than they do farther northward, and they are no where more violent, for they sometimes pour down for three or four days together without intermission. There is no country in the Indies where these rains, during the western monsoons, are attended with more terrible storms of thunder and lightning; but the people, being used to them, are not much alarmed, but bear them patiently, and are seldom heard to complain of the climate.

This island stretches from the south-east to the north-west, and a long ridge of mountains extend through the middle of it from one end to the other: one of them, which is about forty miles within the land beyond Ben-coolen, is above a mile perpendicular. Those that lie towards the west coast are stony, but produce small trees, shrubs, and grass; and towards the bottom good timber. In one of these islands is a volcano that almost continually casts out flames. The champion country has a rich deep mould of various colours, as red, grey, and black, and is well watered with brooks and small rivers, but none that are navigable for ships of burthen. The soil about Ben-coolen and Marlborough-fort is a fertile clay, and produces very high grass. The low-lands close to the sea are almost one continued morass, producing only reeds, or great hollow bamboo canes.

Gold, tin, copper, and lead, appear to be the only metals found in the country; and the former is as plentiful here as in any part of Asia; great quantities of gold-dust being found in the rivers and rivulets, particularly during the time of the west monsoon, when the torrents roll with great rapidity from the mountains. It is usually found in dust or small bits weighing from half a grain to two or three pennyweights; but we are assured by Mr. Lockyer, that he saw a lump as it came from the mines that weighed an ounce; but he acknowledged that it is not usually found in such large pieces. The rock-gold, as it is called at Achen, is known by its brightness, and is very fine. The gold-mines are probably in some mountains towards the middle of the island; but they are as much as possible concealed from foreigners, no European having ever visited them, or at least have never returned from thence. But though the mountaineers are in possession of the gold-mines, they make but little advantage of them. They exchange this rich metal with the inhabitants of the flat country at a low price for rice, cloathing, tobacco, and other necessaries; while the subjects of Achen and the Malaysans, being better acquainted with its value, make extravagant demands of all the foreigners they deal with for the gold they bring them; and, that strangers may have no inclination to penetrate farther into the country, and establish a trade directly with the mountaineers, they represent them as the most barbarous and inhuman cannibals.

In the mountains all sorts of precious stones are to be found, with the value of which the inhabitants are but little acquainted, and yet will not allow them to be sought after.

SECT. II.

Of the Trees, Fruits, and Plants of Sumatra; with a particular Description of the Pepper-Plant and Silk Cotton-Tree. Of the Beasts, Reptiles, Fowls, and Fishes of that Island.

THE inhabitants have very considerable plantations of sugar-canes, which are chiefly cultivated on account of the spirits they extract from them, which they find to be of great advantage in so moist an air. The gardens are furnished with beans, peas, radishes, yams, potatoes, pumpkins, and several kinds of pot-herbs unknown in Europe. The potatoes are three or four inches long, mealy, and of a sweet taste; they are red on the outside, and, like ours, white within. But the only grain that grows in this country is rice.

Here are found most of the fruits to be met with in other parts of India in great perfection; as pine-apples, plantains, limes, oranges, citrons, cocoa-nuts, pomegranates, mangoes, durions, guavas, the mangosteen, the pumple-nose, &c.

The mangosteen, which is esteemed a most delicious fruit, resembles in its form the pomegranate, but is less;

the outside rind, or shell, is thicker than that of the pomegranate, but softer, and of a dark red; the inside is of a deep crimson, where the fruit consists of four or five cloves about the size of a man's thumb, as white as milk, and very soft and juicy; and in the middle of each is a small stone.

The pumplenose is also a very fine fruit, and has an agreeable taste; it is bigger than the largest orange, and has a thick tender rind. The inside contains abundance of seeds of the size of a barley-corn, and full of juice; but it has no partitions like the orange.

The most valuable plant, with respect to commerce, produced in this island, is that of pepper, which grows in a flat soil; and is planted by a thorny tree, round which it creeps and winds like ivy, which it resembles in its leaf, though it is something larger, and of a paler green. Having run up a considerable height, the twigs on which the berries hang bend down, and the fruit appears in clusters nearly as large as bunches of grapes, and of much the same figure; but are distinct like our currants or elderberries. They produce no fruit till the third or fourth year; after which they bear for the three following years six or seven pound weight of pepper. In the three next years they decrease one-third, both in the quantity and size of the pepper, and thus continue decreasing for four or five years longer. When the plant begins to bear, the branches of the tree, through which it creeps, must be lopped off, lest they intercept the rays of the sun, which this plant stands most in need of. When the clusters of the fruit are formed, care must also be taken to support them with poles, lest the branches should be drawn down by their weight. The plants should likewise be pruned after the fruit is gathered, to prevent their growing too high, and bearing the less fruit.

The pepper-plant has commonly a white flower in April, which knots in June; and the next month the fruit being green and large, the natives make a rich pickle of it, by steeping it in vinegar. In October it is red, in November it begins to grow black, and in December it is all over black, and consequently ripe. This is generally the case, though in some places it is ripe sooner.

The fruit being ripe, they cut off the clusters, and dry them in the sun, till the berries fall off the stalk, which, notwithstanding the excessive heat, it does not do in less than fifteen days; during which the clusters are turned from side to side, and covered up by night. Some of the berries neither change red nor black, but continue white: these are used in medicine, and sold at double the price of the other. But the inhabitants, finding that foreigners want them for the same use, have discovered a way of whitening the others by taking them while they are red, and washing off the red skin with water and sand, so that nothing remains but the heart of the pepper, which is white. Nothing can be kept neater than those pepper plantations, no rubbish, not so much as a stick or straw is to be found upon the ground; and if it happens to be a dry season, they are indefatigable in watering the plants, almost their whole subsistence depending on the crop.

Cotton and cabbage-trees also grow here, though they are not very common; and near the city of Achen the silk cotton-tree flourishes. These trees are large, and have a smooth ash-coloured rind, and are generally full of fruit, which hangs down at the ends of the twigs like purses three or four inches long. No tree can grow more regular and uniform; the lower branches being always the largest and longest, and the upper gradually lessening to the top. When the cotton is ripe, the seeds drop off the tree, for the cotton is so short, that it is not thought worth gathering, though they will sometimes take the pains to pick it off the ground to stuff their quilts with.

In the woods they have oaks, and other large timber trees, straight, tall, and fit for any uses; but few of them are known in Europe.

Scarce any country affords more canes and bamboos, particularly near Jamby, where are found those fine taper walking-canes called dragons-blood.

In this island is also found the plant called bang, which very much resembles hemp; they infuse it in their liquors when they would raise their spirits, and it has much the same effects as opium.

The animals found in this island are a small kind of horses, elephants, buffaloes, goats, hogs, deer, bullocks, and hog-deer. This last is an animal something larger than a rabbit, the head resembles that of a hog, and its shanks and feet are like those of the deer. The bezoar-stone found in this animal has been valued at ten times its weight in gold: it is of a dark brown colour, smooth on the outside, and the first coat being taken off, it appears still darker, with strings running underneath the coat; it will swim on the top of the water. If it be infused in any liquid, it makes it extremely bitter: the virtues usually attributed to this stone are cleansing the stomach, creating an appetite, and sweetening the blood.

There are several kinds of wild beasts, as tygers, wild boars, and monkeys: they have also porcupines, and squirrels, which are esteemed good eating: there are likewise alligators, lizards, guanoes, and several sorts of snakes and serpents, with ants, muskeroes, and other troublesome insects.

They have great plenty of dunghill-fowls and ducks, and their cocks are esteemed the largest in the world. In the woods are wild pigeons, and doves of several sorts, with parrots, paroquets, and mackaws; and a great variety of small birds different from ours, and distinguished by the beauty of their colours.

They have great plenty of sea and river fish, so that two or three nets and a boat will procure a man a very comfortable livelihood: they have also a way of catching fish, by fixing a wooden grate at the mouth of the small brooks and creeks at high water, and this detaining the fish that have entered the creeks, they take them when the tide ebbs out. Among other fish they have mullets, cat-fish, eels, oldwives, craw-fish, shrimps, oysters, and green turtle, with several other kinds not known in Europe.

SECT. III.

Of the different Inhabitants of Sumatra, their Persons, Dress, Food, Customs, Manners, and Skill in mechanic Arts.

THE inhabitants of this country consist of two different people. Those of the inland mountainous parts are the original natives, and like those of the other islands, are Pagans; while those on the coast are of the Mahometan religion, and probably came from Arabia and Persia.

As to the Malayans, who inhabit the coast, they are generally said to be proud and lazy, and like the Spaniards, have most of their business done by foreigners; for they seldom apply themselves to cultivate their grounds, or to improve in any mechanic arts.

They are of a swarthy complexion, and their features not very engaging. Their faces pretty nearly resemble those of the inhabitants of the other islands we have already described. They have black eyes, and straight black hair, with high cheek bones, and little noses. They are of a middle stature, straight, and well limbed, and, like the inhabitants of most hot countries, smear themselves with oil, which is probably intended to close up their pores, and prevent that profuse perspiration which would exhaust their strength; and at the same time preserve them from being bit, or stung by the insects, which are ever troublesome in hot countries.

Some of them wear caps of woollen cloth just fitted to their heads, but they more generally tie a piece of blue or white linnen about their heads, letting the ends hang down, and leaving no other covering for the top of their heads, but their hair, part of which falls upon their shoulders. The poorer sort wear only a cloth about their loins, to cover what modesty teaches them to conceal; but people of rank have a kind of drawers, and a piece of silk or calicoe thrown loose about their bodies. They also wear a sort of wooden clogs or sandals, when in their towns; but they all travel bare-foot.

Their ordinary food, as in other parts of India, is rice and fish; but the people who can afford it, also eat fowls, venison, buffalo beef, mutton, and goats flesh. They season their meat very high with pepper, garlic, and onions, and generally colour their rice yellow with turmeric.

Their

Their buffaloe bee is very coarse food, and the little fat that is upon it is as yellow as saffron. When their meat has hung a few hours in the market it turns black, and is little better than carrion: their fowls and mutton are also dry and insipid; and though pork is the best meat they have, there are but few hogs. Their venison, however, is pretty good, especially the hog-deer, which we have just described, for its flesh is as white as a chicken. Their ducks are also much better than their land fowls. They have a kind of liquid butter like oil, brought from Bengal, which is said to be made of buffaloes milk, and mixed with hogs lard; with this they butter their rice. They have also mangoes and other fruits pickled when green.

Their meat is served up in silver, brazen, or earthen vessels, according to the circumstances of the master of the house, and is always either boiled or broiled, and cut into small pieces, and as they use only their fingers in eating, they wash both before and after their meals.

They usually drink fair water or tea; but they have likewise palm wine, and toddy, which is drawn from the cut branches of the cocoa-tree: they likewise drink the soft liquor found on the inside of young cocoa nuts, which is very cooling and pleasant; arrack is also very common here.

The natives are as fond of chewing betel and areka, and of taking opium, as those of the other islands already mentioned. They also take bang, which raises the spirits almost as soon as opium; this plant, which resembles hemp, they infuse in their liquors. Tobacco is seldom smoked in pipes, but a leaf of it being rolled up to about the length and thickness of a man's finger, is lighted at one end, and smoked at the other, till about two thirds of it is consumed, and then it is thrown away. They seldom drink when they smoke.

Like other Asiatics, they sit cross-legged on the floor at their meals, and whenever they meet to converse with each other. Their ordinary salutations are performed by lifting up one or both hands to their head; but before the great, they prostrate themselves with their faces to the ground.

The people are immoderately fond of gaming, both with cards and dice, which were probably introduced by the Chinese; as they are also of cock-fighting. Instead of trimming their cocks, they produce them with all their gay plumage, and fasten such sharp instruments to their heels, of the shape and length of the blade of a penknife, that the battle is over in an instant, one stroke frequently bringing down the stoutest cock. They stake their whole fortunes upon one of these battles; but the conquest is not admitted, unless the victor peck or strike his enemy after he has dispatched him; for if he does not they draw stakes.

Stag-hunting is one of the chief of their rural sports: the game is roused by some little yelping dogs, and the huntsmen, who are almost naked, run it down on foot, darting their lances at the deer, when they come within their reach. One of our governors of Bencoolen relates, that the company's slaves being one day seeking for game, instead of a stag, happened to rouse a tyger, who coming behind one of them, leaped upon him, and with his claws tore the poor fellow's flesh off his back, and the calves of his legs, in a terrible manner; but the brave fellow suddenly turning, pierced the beast with his lance, as did some of the rest of his fellow slaves with theirs, and though they did not quite kill him, he was glad to retire with several lances in his body. The wounded slave was brought to the fort so mangled, that his recovery was thought impossible; but being of a strong constitution, and used to a temperate life, his wounds were soon healed.

Elephants, horses, and buffaloes, are sometimes used for carriage; but they commonly employ porters, when they have not the convenience of a navigable river, and for the most part travel on foot.

Their mechanics are, in general, but indifferent workmen, their carpenters, indeed, will run up one of their cane tenements in a few days; but both the model and materials being always the same, this requires but little ingenuity.

Their flying proas are the most admired of any of their workmanship; they are very long, but so narrow, that two men cannot stand a-breast in any part of them. The

keel is only a large tree hollowed, and the sides are raised with a plank about three feet above it, and each end left as sharp as possible, the keel projecting beyond the other part of the vessel, though, when loaded, it is quite under water. Instead of a rudder they steer with a long piece of wood not broader than one's hand. These vessels carry a great sail, and have outlayers on each side, with planks of light wood at the ends, and when it blows hard, they send out a man or two to sit at the extremity of the windward outlayer to keep the vessel from oversetting. Thus managed, they will bear the greatest sea; and when an English pinnace, with two sails, makes five miles an hour, these will run ten or twelve; however, they are never used but in fishing, or to sail to some neighbouring island. They have larger proas that carry fourteen or fifteen ton, with which they trade to Siam, Malacca, Pegu, and other places; but they have no large ships or vessels of force.

They have also blacksmiths, but their work is not much admired, and their taylor is still greater bungler. The Chinese are the best mechanics among them. Some of that nation live at Achen all the year round; but there usually arrives ten or twelve sail of Chinese ships in June, with great quantities of rice, and all sorts of merchandize. These take up a whole street at the end of the town next the sea. With this fleet come over various kinds of mechanics, as carpenters, joiners, and painters, who immediately set themselves to work, making chests of drawers, cabinets, tables, and all sorts of toys and utensils, which are presently exposed to sale; so that for two or three months this part of the town is like a fair, all manner of people resorting thither. If the Chinese can meet chapmen to their minds, they will even sell their ships too, reserving only so many as are necessary to carry them home. But though the people of Sumatra are, in general, such indifferent mechanics, there is hardly any great man or even a sovereign prince, upon the west coast, but learns some handicraft trade: their favourite employment is that of a goldsmith, in which they excel, for the people are very expert in making all sorts of gold plate with very few tools, and yet with such extraordinary dexterity, that whatever is of their workmanship, sells at a very high price throughout the Indies.

The old women are the only physicians. Some of these have observed the nature of their simples and drugs, and found their skill on their own experience. The flux is the most common distemper in these countries, and the most fatal to foreigners; there are however many kinds of fruit and herbs that would be of service to the Europeans, were they to take them when first seized by this distemper; particularly the guavas and pomagranates: they should also avoid being too free with some other fruits, or with unboiled water, and sherbert is still more unwholesome. There is also a distemper called the Morteluchin, or a perpetual vomiting and looseness, which frequently proceeds from too plentiful meals, and suddenly carries off the patient; but dropsies, the gout, and the stone, are seldom heard of in this part of the world.

All their learning consists in writing, reading, and some traditional accounts of their history and religion. The Mahometans, who possess the greatest part of the island, generally speak and write the Malayan tongue; but there are some offices of their religion in Arabic, and there are schools at Achen where the children are taught the languages. The inhabitants of the mountains have a language peculiar to themselves, and as the Malaysians write from the right hand to the left, the mountaineers write like us, from the left hand to the right, and instead of pen, ink, and paper, write, or rather engrave, with a sharp pencil on the smooth outside of a bamboo; but the Malaysians use ink, and write upon a thin brownish paper that will hardly bear. They are very indifferent accompanists; but the Banians and Guzarats, who reside among them, and whom they employ when they have any considerable accounts to settle, are said to be a match for any European.

The greatest part of the people are Mahometans, but they are not so zealous as those in other parts of the world. Their mosques are mean and poorly built; at Achen, however, they are of brick or stone; but in the southern part of the island they are hardly to be distinguished

ed from the common houses. Yet their priests, and particularly the cady or high-priest at Achen, is held in high veneration, and they seem to have a great hand in conducting the affairs of state.

Polygamy and concubinage are allowed here, as in other Mahometan countries; but the priest must be consulted, he being esteemed the only judge of its expediency; for as he at first ratifies the contract, none but one of the same order is allowed to dissolve it.

SECT. IV.

A Description of the City of Achen, with some Account of the Palace. A diverting Incident, shewing the sagacity of an elephant.

ACHEN, or Achem, the most considerable port of the island, and the metropolis of a kingdom of the same name, is situated at the north-west end of Sumatra, in five degrees, thirty minutes north latitude, and stands in a plain surrounded with woods and marshes, about a mile and a half distant from the sea, near a pleasant rivulet. It is an open town, without either wall or mote, in the middle of which stands the king's palace. This is of an oval form, about a mile and a half in circumference, encompassed by a mote twenty-five feet broad, and as many deep, and by great banks of earth well planted with reeds and canes, that grow to a prodigious height and thickness. These cover the palace, and render it in a manner inaccessible; they are continually green, and not easily set on fire. The gates are not defended by a ditch and draw-bridge, but only by a stone wall about ten feet high, that supports a terras on which some gums are planted. A small rivulet lined with stone runs through the middle of the palace, and has steps leading to the bottom, for the convenience of bathing.

Four gates, and as many courts, are to be passed before you can reach the royal apartments. In some of the outer courts are the magazines, and the elephants; but the inward courts are hardly ever entered by foreigners, or even by the natives, so that no just description can be given of them. The avenues to this palace or castle, as it is sometimes called, are well defended by nature; for all the country round Achen is full of rivulets, marshes, and thick woods of bamboos, which are in a manner impenetrable, and very hard to cut. Several little forts are also erected at proper distances in the marshes, where guards are planted to prevent any surprise. Some authors tell us, that in the king's magazines are deposited a numerous artillery, and a multitude of fire-arms; but, that his greatest strength consists in his elephants, who are trained up to trample upon fire, and to stand unmoved at the report of a cannon.

The city contains seven or eight thousand houses, which are not contiguous, every person's dwelling being encompassed by pales at some yards distance from it, except in two or three of the principal streets where the markets are kept, and also in the Chinese and European streets, where the inhabitants chuse to live pretty close together, the better to defend themselves from the thieves with which this city is much infested.

Most of the houses are built upon posts nine or ten feet above the ground, to secure them from the annual inundations. The sides, floors, and partitions are all of split cane, or bamboo, and the roofs covered with palm-leaf leaves; but to save the best of their goods from fire, they have a warehouse of brick or stone in the form of an oven, and as large as an ordinary room. The entrance is not above three or four feet high, and very narrow, and they have a large stone ready fitted to stop it up in case of fires, which often happen, and spread with such fury through these slight buildings, that they have hardly time to save themselves.

There are a great number of mosques in the city built with stone, and roofed with tile; but they are neither large nor lofty, nor have any towers or steeples belonging to them. Besides the natives, the city is inhabited by the Dutch, Danes, Portuguese, Guzarats, and Chi-

nese, of whom the latter are the most numerous, and carry on a considerable trade.

Elephants are very plentiful in this city, and captain Hamilton observes, that in 1702, he saw one that had been kept there above a hundred years; but by report was then three hundred years old; he was about eleven feet high, and was remarkable for his extraordinary sagacity, as an instance of which he relates a comical piece of revenge he took on a taylor. In the year 1692, says he, a ship called the Dorothy, commanded by captain Thwaites, called at Achen for refreshments, and two English gentlemen in that city went aboard to furnish themselves with what European necessities they had occasion for, and amongst other things, bought some Norwich stuffs for cloaths, and there being no English taylor to be had, they employed a Surat, who kept a shop in the great market place, and had commonly six or ten workmen sewing in his shop. It was the elephant's custom to reach in his trunk at doors or windows as he passed along the side of the street, as begging for the decayed fruits and roots, which the inhabitants generally gave him.

One morning as he was going to the river to be washed, with his rider on his back, he chanced to put his trunk in at this taylor's window, and the taylor, instead of giving him what he wanted, pricked him with his needle. The elephant seemed to take no notice of the affront: but went calmly on to the river, and was washed; after which he troubled the water with one of his fore feet, and then sucked up a good quantity of the dirty water into his trunk, and passing unconcernedly along the same side of the street, where the taylor's shop was, he put in his trunk at the window, and blew his nose on the taylor with such a force and quantity of water, that the poor taylor and his journeymen, were blown off the table they worked on, almost frightened out of their senses; but the English gentlemen had their cloaths spoiled by the elephant's comical, but innocent revenge.

SECT. V.

Of the Government of Achen, and the other Parts of the Island of Sumatra. The Revenues of the Princes. The Arms used by the Soldiers, and the Punishments inflicted on Criminals at Achen.

THE most ancient accounts we have of the isle of Sumatra, mention its being divided into a multitude of little kingdoms, and principalities, which when the Europeans first arrived there, were mostly united under the king of Achen; but that the king of Bantam, in the island of Java, claimed the sovereignty over some districts on the south coast of Sumatra, and particularly of Jamby and Palamban; whose governors, however, still enjoyed the title of Pangarans, or sovereign princes, and continued in the administration of their respective governments, though subject to the controul of the king of Bantam.

The several kingdoms and states in this island seem to be very differently constituted, and most of them have experienced great revolutions and alterations in the last century.

We shall begin with the kingdom of Achen, which is by far the most considerable, and includes all the northern part of the island. Some travellers say, that this is a mixed, and others that it is an unlimited monarchy; some that it is governed by a man, and others that none but women are suffered to reign. That they have not always been governed by queens is evident from the letters sent by their kings to queen Elizabeth and king James I. and it appears most likely that they have been governed by both, and that the sex is no bar to the succession. In this kingdom are twelve oran cayas, or great lords, who exercise sovereign authority in their several districts, and yet are in some respects subject to the king, and are the principal officers of his court. These oran cayas have sometimes deposed the king, elected another, and restrained his authority. At other times the regal power has prevailed, and the oran cayas been assassinated or made dependant on the court; and then the prince was absolute. As to the eldest

eldest son's succeeding to the throne, this does not seem to be much regarded by the Eastern princes, who generally dispose of their crowns to which of their children they think fit, whether he be the son of a wife or a concubine: though this sometimes occasions a struggle after their death, but that competitor who can make the greatest interest among the persons of highest distinction usually carries it, and hence the crown is frequently thought to be elective.

The king of Achen is represented by some authors as the most voluptuous prince in the world; his palace is filled with an incredible number of women: some remain continually about his person, either to cool and refresh the air with large fans, to amuse him with their conversation, to divert him with their songs, or to satisfy his desires. There are about thirteen hundred in the halls and courts of entry, where they mount guard by turns night and day. Others are in the kitchens and the offices, where they prepare every thing that is for the king's immediate service. It has been observed, that his palace is the theatre of jealousy, hatred, and perpetual complaints. The severity of the laws, and the rigour of the punishments, are the only barriers capable of containing them within bounds.

His revenues are acknowledged to be very great, there being such plenty of gold in the island: for the customs of Achen are very considerable, and the crown-lands, which are cultivated by the king's slaves, supply his court with provisions.

That part of the island which lies to the south of the equator is divided into several petty kingdoms, the princes of which stile themselves sultans as well as the king of Achen, but they are frequently called pangarans and rajahs. Each of these has his nobility, of which his council is composed; and almost every town and village has a governor, who is usually chosen by the inhabitants of the district, and confirmed by the sultan. There are also some free towns upon the coast, governed by their own magistrates, who are called datoos: of these Bencoolen has twelve, and Silebar four, who do not seem to be under the dominion of any neighbouring sultan, but to have the supreme power lodged in themselves; though they generally pay great respect to the princes that are near them.

The revenues of the kings of the southern provinces chiefly arise from the duties on pepper and the gold mines. Their forces are separately inconsiderable; but upon certain occasions, they have expelled both the Dutch and the English from very considerable settlements.

The arms used by these people are a broad-sword, a dagger, which they wear naked in their girdles, and a long shield made of tough rattans, interwoven and covered with the skin of a tyger, or some other beast: and both in the kingdom of Achen and some other parts of the country they have great guns and muskets. They have also some war-elephants, but these seem rather to be kept for state than use.

They have no written laws, except those recorded in the Koran. They proceed upon immemorial custom; and in doubtful cases the most ancient people are consulted; and if a precedent be remembered, it is thought sufficient to regulate the sentence. Murder and adultery are punished with death, and a crowd of executioners stab the criminal with their daggers; but female offenders are usually strangled. For robbery and theft they cut off one or more joints of the criminal's fingers or toes, and sometimes an arm or leg, according to the nature of the crime; and the third offence is punished with death. This cruel punishment of dismembering is performed in a very rude and awkward manner. They have a block with a broad hatchet fixed in it, with the edge upwards, and the limb being laid upon it, is struck with a wooden mallet till the amputation is made. They also use beheading and impaling; and some of the sultans of Achen are charged with inflicting the most inhuman tortures on their subjects of the highest rank for very trivial offences: for persons of all conditions, who have fallen into a fault, are liable to punishment; and in some reigns persons of the royal family have been seen at court without either hands or feet, and have been treated in that manner for faults which would hardly have deserved notice in any other country. The sultan

is frequently the spectator, and even the executioner of the punishments inflicted; and is said to have elephants trained to torment criminals, who understand by the least signs what the prince requires of them. He has been seen to pass coolly from that spectacle to that of cock-fighting, in which many of the Indian kings take great pleasure. This was probably the case under some of their tyrants. Admiral Beaulieu relates a dreadful scene of cruelties committed by the king in his presence: but these monarchs have behaved with greater moderation since the English have traded to that city; and later travellers give us no formidable idea of their power and grandeur:

All offenders are brought to a speedy trial, and sentence is no sooner passed than it is executed. As to civil causes, they are decided by the opinion of the magistrate, and such precedents as tradition or his own experience has furnished him with. Those of their magistrates who live in the neighbourhood of the English, where the affair is intricate, frequently desire the opinion of the principal persons among the English, and pay an uncommon regard to an European who is a man of sense and temper, when they are so happy as to meet with him; but nothing endears the English more to this people than their learning the Malayan tongue, they having been greatly imposed on by linguists.

SECT. V.

A concise Account of the first Settlement of the Trade to Sumatra by the English; with the Reception they met with from the King of Achen.

BEFORE we give a particular account of the English and Dutch factories on the coast of Sumatra, for purchasing pepper and other valuable articles of commerce, it may be expected that we should give the reader a view of the manner in which that trade began; which is the more necessary, as Sumatra was the first country to which the English East-India company traded in the Indies.

Captain Lancaster, who, according to the custom of that age, was styled general, commanded the English fleet, and arrived in the road of Achen on the fifth of June, 1602, where he found the ships of several nations; and the fame of queen Elizabeth's victories over the Spaniards having reached that part of the world before him; made way for his favourable reception among the Indian princes.

Soon after the general's arrival, he sent captain Middleton, who had the title of vice-admiral, with four or five English gentlemen, to wait upon the king of Achen, and solicit for his obtaining the honour of delivering the queen of England's letter into his majesty's hands.

Captain Middleton not only met with a favourable reception, but was entertained by the king, presented with a habit of the country, and was ordered to assure the general, that he might come on shore with the same freedom and security as if he was in her majesty's dominions; and if he was under any apprehensions, such hostages should be sent on board as he desired:

Two days after the general went on shore, and there being two Dutch factors at Achen, they invited him to their house: here a nobleman from the king came to attend the general, and ask for her majesty's letter; but being informed that it was not customary in Europe to deliver letters of this kind to any but the king in person, six elephants, with drums, trumpets, streamers, and a vast retinue, were instantly sent to bring the general to court. The largest of these elephants was about fourteen feet high, and carried a machine upon his back that had some resemblance to the body of a coach covered with crimson velvet, and in the middle of it stood a golden bason, in which the queen's letter was put, and covered with a piece of rich silk. The general was mounted on another elephant, some of his retinue on the rest, and others walked on foot.

On their coming to the gate of the palace, a nobleman, who appeared as master of the ceremonies, desired them to stay till the king was informed of their approach. They were soon after dismounted, and admitted to his majesty's presence, whom the general saluted after the manner of the country, and, declaring he was sent from the most mighty queen

queen of England to propose an alliance and friendship between her and his majesty, was going on with a long harangue, he not being informed of the aversion of the Indian princes to long speeches; but the king, interrupting him, desired him to sit down, and told him that he was welcome to his country, and might depend upon all the favours he could reasonably ask, in behalf of that noble princess of whom fame had uttered many great things.

The general then delivered the queen's letter to his majesty, who gave it to an officer that stood by him, and the queen's present was set before the king, consisting of a large silver basin, with a fountain in the middle of it, weighing upwards of two hundred ounces, a large silver cup, a fine looking-glass, an embroidered sword-belt, a very handsome pair of pistols, a plume of feathers, and a fan made of feathers. He seemed most pleased with the fan, and immediately bid one of the women fan him with it.

Soon after the company were ordered to sit cross-legged, after the manner of the East, and an entertainment was served up in dishes of gold, or tamback, which is a mixture of gold and brass. The king was seated in a gallery raised about six feet above the hall of audience, and frequently drank to the general a glass of arrack; who, having pledged him in that liquor, was afterwards allowed to drink what liquor he pleased.

After dinner the king's women were called in, and danced after the manner of the country. The king then ordered the general to be presented with a habit of the country, which he put on in his majesty's presence; and then withdrawing, went with his retinue on board the ships.

His majesty having ordered two of his noblemen to treat with the general on the alliance with the queen, and settling articles of commerce, it was at length agreed, that the English should enjoy a free trade, and no customs be paid for goods imported or exported: that in case of shipwreck, assistance should be given to the English, and the goods restored to the owners; and, in case of death, the English should have liberty to bequeath their effects to whom they pleased: that all contracts with the king's subjects should be punctually performed; and if the English received any injury from the natives, the king should do them justice: that they should determine all differences among their own people, and enjoy the freedom of their religion.

These articles being settled, the English factors proceeded to purchase pepper; but the Portuguese using all arts to obstruct their trade, the general resolved to cruise in the straits of Malacca for their ships; and, on the third of October, 1602, took a large Portuguese carrack of nine hundred tons burthen, with above six hundred persons on board, and laden with nine hundred and fifty bales of chints, and calicoes, with abundance of rice and rich merchandize sufficient to freight all the English vessels.

The general, on his return to Achen, made the king a present of some of the most valuable things he had taken in the prize: upon which his majesty congratulated him, and seemed rejoiced at his success; for the Portuguese had behaved with such insolence, that all the Indian princes were exasperated against them.

The general having finished his affairs, and settled several factors at Achen, had his audience of leave, when he received from the king a letter to her majesty in the Arabic tongue, and also two habits for the queen of rich silks embroidered with gold, and a ring set with a fine ruby. The general himself was presented with another ring of the same kind; and, on his taking leave of his majesty, that prince assured him, that whenever any English ships came into his ports, they should meet with the same kind of usage he had found there. This our countrymen long experienced, no other nation enjoying the same privileges as the English at the city of Achen.

The general now sending one of his ships laden with pepper to England, directed his course to Bantam, in the isle of Java, where he met with a very favourable reception; and having taken a house in the city, brought goods ashore, which he sold to the natives, and bought pepper and other spices with the money: then leaving eight factors in his house at Bantam, to manage the affairs of the company there, he took leave of the king, and setting sail for England, arrived in the Downs on the eleventh of

December, 1603, after having made a very advantageous voyage for the company.

In short, the English had a factory many years at Achen; but at length, the company finding that it did not answer the expence, it was recalled. In that city all other foreigners pay five, and sometimes eight per cent. custom; while the English made only the usual presents to the king and court, amounting in the whole to sixteen or seventeen tael. These presents consisted of two pieces of fine cotton cloth, presented to the king at the ship's first coming to land, and two more at their departure; two or three tael to the eunuch who delivered the first present, and two more to him that carried the last: and when the four first boats, loaded with goods, were sent ashore, a tael and a half was paid instead of all customs. A piece of silk, or calicoe, was also presented to the sabandar, or governor of the port of Achen; and another to the chief oran caya, or minister of state, when the first present was sent to the king.

SECT. VII.

A concise Account of the English Factories in the Isle of Sumatra, particularly of Bencoolen, Marlborough-Fort, and Sillebar.

BENCOOLEN is situated on the south-west coast of Sumatra, in three degrees ten minutes south latitude, and one hundred and three degrees east longitude from London, and, from the year 1685, to the year 1719, was the principal settlement of the English upon that island. It is known at sea by a high slender mountain, called the Sugar Loaf, that rises in the country twenty miles behind it. Before the town of Bencoolen a small island, called Rat Island, breaks the swell of the sea, and with the point of Sillebar, which extends two or three leagues to the southward, forms a large bay. Within this island the ships usually ride; but this road is inconvenient, especially during the south-west monsoons. On the north-west side is a river, which brings the pepper out of the inland country; but there is great inconvenience in shipping it, on account of a dangerous bar at the river's mouth.

The town is near two miles in compass, and was chiefly inhabited by the natives, who build their houses upon pillars of bamboo, as in other parts of the island; and formerly the English, Portuguese, and Chinese had each a separate quarter, in which the houses of the English were erected after their own model. Though there was no want of brick or stone, they found themselves under the necessity of building with timber, on account of the frequent earthquakes, to which the island is subject; but the Chinese, after the manner of their country, had low houses that had only the ground-floor.

As Bencoolen is situated on a stinking morass, its unhealthy situation proved fatal to great numbers of the English: besides, the natives had for several years appeared very uneasy, and seemed to threaten the destruction of the English settlement; which is the less wonderful, as the English, who were unhappily sent thither, were so void of understanding as to treat the natives like their slaves; for Dampier observes, that while he was there, the English chief who governed Bencoolen had so little discretion as to put two of the neighbouring rajas, or kings, in the stocks, because their people did not bring down pepper so fast as he expected. In short, the badness of the air, and the ill conduct of the English company's servants, made it necessary to fix upon a situation that was at once more healthy, and would admit of a more regular fortification than the place where the old fort stood.

Accordingly a fort was marked out upon a rising ground about two or three miles to the southward of Bencoolen, the foundations were laid, and the walls, which are of brick, began to rise, when the country being ripe for an insurrection, assembled in arms against the English, cut off part of the garrison, and the rest escaped in their boats to sea, and got on board one of the company's ships.

But though the natives had thus driven the English from Bencoolen, in about a year's time they suffered them to return, and complete the fortifications at Marlborough-fort, as it is now called, without opposition; and there the factory enjoy the advantages of a pure air, sound health, and

and flourishing trade, though it is only two or three miles distant from Bencoolen.

About ten miles to the southward of Bencoolen is Sillebar, which is situated in a bay at the mouth of a large river of the same name, in four degrees south latitude. But this place has no good fresh water; for if that which proceeds from the springs there be drank for a considerable time, it occasions gripings and fluxes. The town is encompassed by large woods and rocky mountains; and, with the adjacent country, was formerly subject to the king of Bantam. The English have a small colony there, which is a detachment from Marlborough-fort, to receive the pepper brought thither by the natives.

Besides these English settlements we have Lattoun, which is situated about forty miles to the northward of Bencoolen; Bentall, which lies at least an hundred miles to the northward of Bencoolen; and Mocho-Mocho, which is situated near Indrapour, and is now the most northerly of all our settlements.

S E C T. VIII.

Of the Settlements of the Dutch at Sumatra, particularly of Padang, Pullambam, and Bancalis.

ON a part of the coast of Sumatra, called the Gold Coast, the Dutch have a factory at Padang, under the management of a chief, who has his council and fiscal; and this is considered as a very profitable as well as honourable post.

The Dutch have likewise a factory at Pullambam, about eight leagues from the sea, on the banks of a very large river which empties itself by four different channels into the sea. The great trade carried on there is that of pepper, which the Dutch endeavour to monopolize in the same manner as they do cloves, nutmegs, and cinnamon; and are therefore at a very great expence in keeping several armed harks cruising at the mouth of this river, to prevent what they are pleased to call smuggling. They have indeed contracted with the king of Pullambam to take off all the pepper in his dominions at the rate of ten pieces of eight, or fifty shillings, for a bahaar, or four hundred pounds weight, which is esteemed a fair price: they have, however, introduced a clause in their contract, by which it is agreed, that half the purchase of the pepper shall be paid in cloth, at such a price as greatly reduces the value of their cargoes; and on this account they are so much afraid of smuggling: yet, it is said, that in spite of their armed barks, on paying a thousand florins to the king of Pullambam, and the same sum to the Dutch chief, a cargo of a thousand bahaars of pepper may be carried off the island without any great difficulty.

Though the country is mountainous, this is not considered as a great inconvenience, since most of the mountains abound with gold, silver, lead, and other metals; and the company are possessed of some gold mines, which are extremely rich, and great care is taken both to secure and conceal the profits that are made of them.

The chiefs of Padang have, however, been so unfortunate as to have their honesty always suspected. This, says commodore Roggewein, is chiefly owing to their management of the mines, that do not turn out greatly to the advantage of the company, while all their officers get immense estates out of them; which the council at Batavia can neither understand nor digest; and for this reason they very often change the chief, but to very little purpose.

The principal places where gold is found by the natives, are Triou and Manicabo, where they obtain it in the following manner. They dig at the bottom of the mountain ditches, where the water being stopped, when rolling down the sides of the mountains in the winter, they, in the summer, draw it off; and by washing the mud which remains at the bottom, obtain from thence considerable quantities of gold dust. Indeed it is generally thought by those, who are best acquainted with the commerce of the Indies, that this island furnishes annually five thousand pounds weight of this precious metal, yet very little, if any, of this gold is ever brought to Europe, the Dutch disposing of it in other places, where gold is highly valuable, to purchase other commodities, which in Europe turn to a better account.

Besides Padang and Pullambam, already mentioned, the Dutch have a strong fort and a great factory at Jamby, and another at Siack; but this last place is very unhealthy. It stands on the great river Andraghira, into which, at a certain season of the year, come vast quantities of shads of a very large size, whose roots being accounted a great delicacy, are taken out, and the rest of the fish thrown away, which, lying in great heaps, corrupt and exhale pestilential vapours that infect the air. The persons therefore that are sent to Siack, are much of the same stamp with those that are sent to Banda, that is, men of abandoned characters and desperate fortunes.

The above roes they pickle with salt and tamarinds, and then dry them in smoke; after which they wrap them up in large leaves, and carry them to all the countries from Achen to Siam. These roes, when dried, are called Turbaw, and captain Hamilton thinks their taste far exceeds that of caviar.

They have another considerable factory on the banks of the river Bancalis, that produces large profit from the sale of cloth and opium, which are constantly paid for in gold dust. This was discovered by a factor in the company's service, who, after he had carried it on privately for about ten years, and acquired by it upwards of one hundred thousand pounds sterling, resolved to secure what he had got, by making a free discovery of this branch of commerce to the company, who then took it into their own hands.

About Bancalis there are prodigious numbers of wild swine, and in the months of December and January their flesh is very sweet and fat. In those months great numbers of people resort thither in small proas. Some go into the woods, and drive them towards the river, while others are ready with dogs to drive them into it, and when one goes, all the herd follow; others are ready with lances in their proas, to pursue them in the water, and lance them. They are taken up on the opposite shore, and immediately carried to places appointed, where there are many fires made of brush wood, with which they singe off the hair, and then taking out the entrails, cut them in proper pieces, and salt them in the proas; each proa having a share in proportion to the number of men it brings. After the pork has lain three or four days in salt, they wash it, hang it in smoke, and then put it in casks with some dry salt; after which it is sold by the cask to the best bidder.

There are likewise several other Dutch plantations on this island, which are all comprehended under the general title of the west coast.

S E C T. IX.

Of the Coin, Weights, and Measures used at Sumatra.

IN this country there are but two sorts of money of their own coining; the first is of lead, which they call cash; of which fifteen hundred make a mafs, or fifteen pence, which is their gold coin: a quarter of a mafs is called a pollam, or copong, which is imaginary: sixteen mafs make one tael, which is likewise imaginary, and equivalent to twenty shillings English. Dollars and other Spanish money are current almost all over the island: but though fifteen hundred cash are commonly reckoned the value of a mafs, they rise and fall as the money-changers think proper, only there are seldom less than a thousand, or more than fifteen hundred, reckoned to a mafs.

At Achen pieces of gold are oftener used in merchandize than their coin, especially in considerable bargains; it is therefore necessary to express at what rate you intend to receive and pay gold, as well as what catty you buy and sell by. The receiving a thousand pounds in their gold mafs would be attended with inconceivable trouble, for brass, mixed metals, and silver gilt, are frequently found among them, and even the money-changers, who are employed in examining them, are sometimes deceived, though, if they receive any bad, they are obliged to make them good to the person by whom they are employed.

A merchant may likewise be greatly imposed on by receiving their gold dust, for they will mix small bits of other metal with it, which are not easily distinguished, and make it necessary to employ the money-changers upon

on these occasions. Great numbers of these people are to be found in the streets of Achen, and they are generally either Guzarats, or natives of the Hither India.

As to the weights used at Sumatra for money and goods five tael make a buncal, twenty buncal make a catty, and one hundred catty a pecul, or one hundred and thirty-two pounds English weight. Three peculs are a China bahar, or three hundred and ninety-six pounds China weight, and of Malayan weight at Achen, four hundred and twenty-two pounds, fifteen ounces; and upon the west coast, particularly at Bencoolen, a bahar is five hundred pounds weight, or five hundred and sixty pounds English.

The usual measure for corn or liquids is the bamboo, which holds about a gallon, and it does not appear that there is any other measure for cloth, besides the natural cubit and fathom.

S E C T. X.

Of the Nicobar and Andoman Islands.

THE Nicobar islands extend northward from the end of Sumatra into the entrance of the bay of Bengal, and lies from the seventh to the tenth degree of north latitude, and between the ninety-second and ninety-fourth degrees of longitude. The largest of them, at which ships usually touch, and that gives name to the rest, is situated most to the southward, and is about forty miles long, and twelve or fifteen broad.

The south end of this island is mountainous, and has steep cliffs towards the sea; but all the rest of the island is low uneven land, covered with woods, in which are a great number of tall trees fit for building, or any other uses. The soil is a rich black mould, and might produce any grain was it cultivated. The island does not appear to produce any valuable commodities, nor has any nation attempted to make a settlement upon it, or to bring the people under their dominion.

The islands are neither divided into kingdoms, nor provinces, nor does it appear that any towns have been built upon them: but in every creek or bay are seen four or five little houses standing by the sea-side, on posts about eight feet from the ground. These have but one room, which is about eight feet in height; but, instead of being ridged like a barn, they are nearly arched with bended canes, and covered with palmeto leaves.

The country is over-run with wood, for they have only a few plantations of cocoa-nut-trees near the sea-shore, from which they draw their beloved liquor toddy, and the nuts afford them meat and drink; for they are said to have neither rice, nor any other grain growing in the country. Instead of bread they use the fruits of the melory tree, which grows wild in the woods: it is of the size of a large apple-tree, has a blackish bark, and a pretty broad leaf. The fruit has the shape of a pear, and, in the largest part, is twelve or thirteen inches round. It has a tough smooth rind, of a light green colour, and

the fruit within 'it is much like an apple, but full of small strings or fibres. They scrape the pulp from the strings with a wooden knife, and making it up in great lumps as big as threepenny loaves, boil them in earthen pots: they will keep a week, but afterwards turn sour. This is their chief food, for they have no roots, except a few yams, nor do they seem fond of hogs-flesh or poultry, though they are in no want of either; but fish is eaten more plentifully, every house keeping a fishing-boat or two.

The natives are tall, clean limbed, and of a dark tawny complexion: they have straight hair and black eyes, their visage is pretty long; their noses are well turned and proportioned, and their faces, taken altogether, tolerably handsome; but the women pull the hair off their eyebrows, which renders them not quite so agreeable as they otherwise would be.

The men only wear a narrow piece of linen tied round their waists, to which they fasten another cloth of about a hand's breadth, and bringing it up between their legs, just cover their nakedness; but the women have a cloth about their loins, which reaches as low as their knees, and serves instead of a petticoat.

The natives are a peaceable, harmless people; and being friendly, and not inclined to quarrel, murder and robbery are seldom heard of among them. They confine themselves to one woman, and live as man and wife, without any priest to tie the nuptial knot. As to their religion, we only know that they have some caves dug in the rocks, towards which, the missionaries observe, they pay a kind of adoration. It is also supposed that they worship the moon, from their great rejoicings at its first appearance. They are not divided into casts or tribes, like the natives of the continent of India, but eat and drink, and mingle with each other, and with strangers, without the least scruple.

Their language is peculiar to themselves: they have, however, some few Portuguese and Malayan words, which are of use to them in bartering with the foreigners who touch upon their coast: for when any ships pass by, both men and women come on board, bringing with them, hogs, poultry, fruit, and other provisions. They also sometimes bring ambergris, but oftener a mixture, which looks very like it, and with which the Europeans are sometimes imposed upon. They usually take in return tobacco, iron, linen, and old cloaths.

The Andoman islands are situated in the bay of Bengal to the northward of the Nicobar islands, extending from the eleventh to the fifteenth of north latitude. As the manners and customs of these people are the same with those of the inhabitants of the Nicobar islands, the above description will serve for both. Several writers have charged the natives of all these islands with being cannibals, and would persuade us, that they have a particular fondness for human flesh, but this is so far from being the case, that like the people of the first ages, they live chiefly on fruit, and are found to be as harmless and inoffensive as any people upon earth.

Of C E Y L O N.

S E C T. I.

The Island possessed by the Portuguese, who are expelled by the Dutch. The Situation and Extent of Ceylon. Its Climate, and Seasons. With a Description of the Face of the Country, and of the Mountain called Adam's Mount.

WE shall now take a view of the delightful island of Ceylon, the most westerly of those beyond the great peninsula of India, and then return back to the continent. The ancients, to whom it was known by the name of Taprobane, considered it as a plentiful source of all sorts of riches and curious merchandize; and the learned Bochart

was of opinion, that this was the country of Ophir and Tarfis, with whose treasures Solomon's fleets were loaded.

The Portuguese discovered this fine island, and considering the advantages that might be drawn from it, landed here in 1506, under the conduct of Laurence Almeida, who took possession of it in the name of Emanuel, king of Portugal, by erecting a column with an inscription, importing, that it had no master, though he at the same time treated with one of the kings of Ceylon, whom he promised the protection of Emanuel, on condition of his paying a yearly acknowledgment of two thousand five hundred quintals of cinnamon. "The Dutch, says the author of

"the

“ the New History of the East Indies, jealous of so lucrative an establishment, begun in 1602 to make attempts to take it from them. The violence they exercised rendered them as odious to the Cinglases (for so the inhabitants of Ceylon are called) as the Portuguese already were on the same account. But they accomplished their designs fifty-five years afterwards. They declared war against the Portuguese; they drove them from the places they had fortified and possessed for a hundred and fifty years before; they seized on the cities of Colombo and Negombo; they placed a garrison in the fort of Punto Gallo; they made themselves absolute masters of the coasts and harbours, but did not enter into the dominions of the king of Candy, who possessed the middle of the island; and they are so anxious to engross the trade of Ceylon, that they suffer no foreign vessels to approach it.”

The island of Ceylon is situated between the sixth and tenth degree of north latitude, and between the seventy-ninth and eighty-second of east longitude from London. It is therefore about two hundred and fifty miles in length from north to south, and near two hundred in breadth from east to west; and the Dutch observe, that in its shape it resembles a Westphalia ham. It is seated about forty-five miles to the south-east of the hither peninsula of India, and is one of the finest countries in the world.

The monsoons and seasons are the same as on the neighbouring continent; for the rains begin to fall much sooner on the Western coast than on the Eastern, just as they fall sooner on the Malabar side of the coast of India, than on the coast of Coromandel, which probably proceeds from the same cause, Ceylon, as well as that great peninsula, being divided by very high mountains. The northern part of the island is subject to great droughts of very long continuance, an affliction that is the more sensibly felt as there are scarce any springs or rivers in that part of the island, and the inhabitants are obliged to be supplied with water as well as food from the South.

There are, however, several rivers in the island, which fall down from the mountains, but are generally so rapid and full of rocks as not to be navigable; the largest is that of Mavillagonga, which has its source in a mountain called Adam's Mount, and running north-east falls into the sea.

As to the face of the country, it is for the most part covered with fragrant woods and groves, and between the mountains are little fertile vallies watered by fine springs. In short, this island not only produces gold and other metals, but topazrs, rubies, sapphires, granates, and crystal.

In the southern part of the island, about twenty leagues from the sea, is a vast plain, in the middle of which is the above mountain covered with a fine turf, on which rises a rock of a pyramidal form; but so rugged, that, it is said, it can only be ascended by means of an iron chain, which hangs from the top to the bottom. It is supposed to be two leagues from the plain to the topmost summit; but the way so bad, that setting out early in the morning, one cannot arrive thither till two hours after mid-day; and the height is so prodigious, that the sailors begin to desery it twenty leagues out at sea. Though the summit of the rock, when viewed from the bottom in the plain, appears like a point, yet it forms a terrace two hundred paces in diameter; in the center of which is a large and deep lake of some of the best water in the world. From thence proceed several rivulets which fall in torrents down the sides of the mountain, and, after being reunited, form three great rivers in the plain. Near the lake is a large stone, on which is the print of a man's foot, as perfectly engraved as if the impression had been made on wax. The Cinglases are persuaded that it is a vestige of the first man, and therefore have called that mountain Hamalel, or Adam's mountain; which the Portuguese have translated Pico de Adam, or the Peak of Adam. The people believe, that the first man was created here; that the lake arose from the tears which Eve shed at Abel's death; and that Ceylon was part of the terrestrial paradise. This tradition, which could only be received from the Jews, it is said came from king Vigia Raia, who, according to the common opinion, lived five hundred years before Christ.

S E C T. II.

Of the Trees and Plants of Ceylon, with a particular Description of the Tallipot-Tree, the Reffule, the Cinnamon-Tree, the Jaka, the Orula, and the Downekaia. Of the different Kinds of Grain, and the Method of Husbandry practised by the Natives.

ONE of the most remarkable trees in Ceylon is the tallipot, which grows straight and tall, and is as big as the mast of a ship: the leaves are said to be so large as to cover fifteen or twenty men, and keep them dry; they are round, and fold up like a fan. The natives wear a piece of the leaf on their heads when they travel, to shade them from the sun; and they are so tough, that they are not easily torn, though they make their way through the woods and bushes with these kind of umbrellas. Every soldier carries one, which also serves him for a tent to lie in; and, without these leaves, it would be impossible to live abroad in the rainy season. This tree bears no fruit till the last year in which it lives, and then has plenty of a hard fruit of the size of a nutmeg. Its trunk contains a pith, which is sometimes eaten like the pith of the sago tree, and bread is made of it as well as of sago.

They have a tree called reffule, that is as straight and as tall as the cocoa-tree, and is also full of pith. From this tree the natives draw a cool pleasant liquor that is very agreeable, though it is no stronger than water, and an ordinary tree yields three or four gallons a day. By boiling this liquor they obtain a kind of brown sugar, which in India is called jaggory; and, it is said, that they can refine it, and make it fit to answer all the purposes of sugar. They obtain this liquor in the following manner: on the very top of the tree grows a bud, which they cut off, and bind about it pepper, salt, limes, garlick, and leaves: under this bud they hang an earthen-pot to catch the liquor, and every day cut a thin slice from the end where the bud grew. The leaves of this tree fall off, and are renewed every year till it arrives at its full growth, and then the same leaves continue on it for several years together. As the bud at the top ripens and withers, others come out lower every year, till they reach to the bottom of the boughs, and then the tree has done bearing, and dies within seven or eight years after. The wood of this tree, which is very hard and heavy, is black, and of this the inhabitants make the pestles with which they beat the rice out of the husks in mortars.

There are here whole forests of oranges, citrons, and cinnamon-trees; and the last are so common, that the smell of them spreads eight leagues round. Salmon says, that in his voyage to India, when the ship was judged by the best seamen on board to be a hundred miles from that or any other land, the air was so extremely sweet, and so replenished with fragrant smells, that he was morally certain they must be near some land. “ I called up, says he, several of my travellers, who regaled their smelling faculty in the same manner; and it was the general opinion, that this must proceed from the cinnamon-groves in Ceylon. However, it is observable, that when people have been long at sea, and draw near any coast, if the wind sets off of it, it will bring a very refreshing smell along with it, though not comparable to that perfumed air we meet with on the coast of Ceylon.”

The cinnamon-tree is peculiar to this island, and is of inestimable value to the Dutch. This tree grows on the south-west part of the island; where it is as common as any other in the woods; but there are few or none to be found towards the northern coast; yet the Dutch have secured all the bays and the mouths of the rivers round the island to prevent other nations settling there, or having any commerce with the natives.

The cinnamon-tree is of the middle size, not very large, and its leaf in thickness, shape, and colour, resembles the laurel.

When the leaves first sprout they are as red as scarlet, and on being rubbed between the fingers smell like a clove. The tree bears a fruit in September that is like an acorn, but neither its taste nor smell has any resemblance to that of the bark. By boiling the fruit in water

they obtain an oil which swims on the top, and has a very agreeable smell; and when it is cold is white and as hard as tallow. This is sometimes used as an ointment for aches and pains; and as it is very common they also burn it in their lamps. Some people assert, that the cinnamon-tree has three barks; but all agree that it has two, and that the cinnamon is the second. The best is that stripped from trees of a middling growth; for neither those that are very young, nor those that are old, are proper for peeling. Having stripped off the outward bark, they cut the next round the tree in several places with a pruning-knife, and cutting them lengthways in slips, peel them off, and lay them in the sun to dry, on which they roll up together as we see them brought to Europe.

Whether the tree be killed by cutting the inward bark, as some affirm, is not very material, since there are abundantly more of them in this island than are necessary to supply the whole world; and therefore the Dutch do not care into how narrow a compass the cinnamon-groves are brought, since, as they have monopolized this spice, they can set what price upon it they please; and the less extent these woods have, the better they will be able to defend them. The body of the tree under the bark is perfectly white, and serves for building and other uses; but it has neither the fragrant smell nor taste of the bark.

Among the other extraordinary trees of this island, is the Orula, which is of the size of an apple-tree, and bears a fruit like an olive; this they sometimes take as a purge: they also use it to dye their cloaths black, by dipping them into water, in which this fruit has been infused; and it is said, that if a piece of rusty iron be thrown into this water, it will eat off the rust, and the iron become bright; but that the water will be so black, that it will serve for ink.

Here are a great variety of fruits; but the natives seldom eat them ripe, or cultivate any but those which serve for pickles. The fruit called jack, or jaka, is a part of their food, it grows upon large trees, is round, and of the size of a peck-loaf: it is covered with a green prickly rind, and has seeds or kernels within it, that resemble a chestnut, both in size, colour, and taste. This fruit they gather before it is ripe, and when boiled it has the taste of cabbage: but when mellow it is eaten raw, and is very good. The kernels roasted in the embers serve them for food when on a journey.

There is another fruit called jambo, which is very juicy, and has the taste of an apple: the colour is white, streaked with red, and it looks very beautiful. They have also some fruits that resemble our plums and cherries; nor do they want any of the common Indian fruits, as pine-apples, cocoas, limes, melons, pomegranates, and mangoes.

The kitchen-gardens of this island are well supplied with roots and herbs; the roots they eat are known by the general name of yams, though they have a great variety of them. They have also several sorts of vegetables, which they eat with butter, some of which are nearly equal to asparagus. They also dress some of their green fruit with rice. The Portuguese and Dutch have introduced almost all the herbs and roots used in our kitchens, as coleworts, lettuce, sage, mint, rosemary, radishes, and carrots; and their woods afford plenty of medicinal herbs, which are well known to the natives, who, by applying them, perform considerable cures.

The country also abounds with flowers of the finest colours, and the most fragrant smells, but the natives never cultivate them, or take any delight in fine gardens; yet the young fellows and girls adorn their hair with them: among others they have white and red roses, that smell as sweet as ours, and also a white flower that resembles jessamine, of which a nosegay is brought every morning to the king, who claims the property of them wherever they grow.

There is another flower called the hopmaul, that grows upon trees. These have a very fine scent, and are particularly used by the young people in their hair. They have likewise a flower called the sindricmal, which is remarkable for opening every evening at about four o'clock, and closing again about four in the morning.

The downekaia is a shrub that bears a leaf, that is only about two fingers broad, and yet is six or eight feet long, and on both sides full of thorns. These leaves they split, and make mats of them. This shrub bears a bud that opens into a bunch of fragrant whitish flowers, like a nosegay, and the roots being full of small fibres, they make their cordage of them.

They have several kinds of rice, some of which require some months before the corn is ripe, some six, others five; and there are other kinds that will be ripe in three or four months from the seed-time: that which ripens fastest has the best taste, but yields the least increase. As all sorts of rice grow in water, the inhabitants take great pains in levelling the ground they design for tillage, and in making channels, for their wells and reservoirs to convey the water to the fields. If they apprehend they have water enough, they sow that kind of rice which yields most, and is the longest in growing; but if they apprehend the water will not hold out, they sow that which ripens soonest. They also contrive to have all their rice ripe together; for as their fields are common, they turn in their cattle after harvest; and if any husbandman is much later than his neighbours, his corn is eaten up by the cattle.

As there are but few springs in the north part of the island, the natives, during the rainy season, save the rain-water in great ponds a mile in extent; and when their fields are sown, let it gradually flow into them a little at a time, that it may hold out till harvest.

Their usual seed-time is in July or August, soon after the beginning of the rains, and their harvest in January or February; but where they have always plenty of water, they pay little regard to the seasons, but sow and reap almost at any time.

Their plough has a handle and foot shod with iron, much like our foot ploughs; but they are both of a piece, and much less and shorter on account of their turning on the side of hills where they are cramped for want of room. A small beam is let into that part which the ploughman holds in his hand, and to which the geers of the buffaloes are fastened: these ploughs do not, like ours, bury the sward, but only serve to break up the ground that is soon after overflowed with water, which rots the grass and weeds. The lands are indeed ploughed twice; after the first they make up the banks, which serve to keep in the water, and for causeys to walk upon from one field to another; for the fields, when overflowed, are knee-deep in water and mud. When the weeds and grass are rotted, they drag a heavy board edge-ways over the land to make it smooth, that it may every where be equally overflowed.

Before they sow their seed they soak it in water, and then let it lie four or five days on a heap till it grows. When the seed is ready they drain the water off the land, and then with square boards fastened to poles again smooth the mud; after which they sow the rice as our husbandmen do wheat and barley, and suffer it to stand without water till it rises a span above the ground. The women then come to weed the rice, and transplant it where it grows too thick; after which they again let in the water, and the rice grows half a foot or a foot deep in water till it is ripe.

Instead of threshing their corn they tread it out with oxen and buffaloes, which is frequently done in the fields where it grows. When it is reaped they lay out a round spot of ground for this purpose, about twenty-five feet in diameter, and dig it a foot and half deep. This method is so expeditious, that half a dozen oxen will trample out forty or fifty bushels in a day. It is remarkable, that the people, before they begin this work of treading out the corn, always perform some religious ceremony, and apply to their idols for a blessing on their labours.

There are several other kinds of grain which the people eat towards the end of the year, when rice begins to grow scarce, particularly curacan, which is as small as mustard-seed; this they beat or grind into flower, and make cakes of it. This grain grows on dry ground, and is ripe within three or four months after it is sown.

They have another grain called tanna, which is as small as the former. Every seed shoots out four or five stalks, each of which has an ear, and it is said to multiply a thou-

a thousand fold. The women who perform most part of the harvest-work cut off the ears when it is ripe, and carry them home in baskets. This is very dry food, and is only eaten when rice is not to be had.

There likewise grows here a seed called tolla, of which they make oil, with which they anoint themselves.

SECT. III.

Of the Beasts and Insects of Ceylon, particularly the Elephants, the Ants, and the Bees. Of the Birds and Fishes.

IN this island there are plenty of buffaloes, oxen, deer, goats, and hogs; they have likewise elephants, monkeys, bears, tygers, jackalls, hares, and dogs; but no lions, wolves, sheep, horses, or asses, except such as are imported by Europeans. Some of their deer are larger than our red deer; but there is another animal that is in all respects like them, except in the size and colour, it is no bigger than a hare, and is grey spotted with white.

This island is most famous for its elephants, which are so numerous, that they do incredible damage to the husbandmen by breaking their trees, and eating and trampling down their corn. Hence the country people are obliged to watch those of their own fields that lie near the woods every night, and they are not secure of their corn when it is placed in their yards. It is with great difficulty that, with lighted torches and making a great noise, they can frighten them away; sometimes they shoot at them, and wound them with their arrows; but the enraged elephant frequently kills them. Their tygers and bears are far less troublesome, for they do no damage to the corn, and seldom attack people without provocation.

The Abbé de Guyon observes, that the tame elephants of Ceylon are more esteemed than any other in the Indies, not only on account of their prodigious bulk, and the beauty of their ivory, but also for their remarkable docility: "They use no other animals but these, he adds, in the carriage of hogheads, and other such burthens. The elephant takes hold of the rope with his trunk and his teeth, he draws it, twists it about, throws the load on his back, and so goes off with it. He draws with equal ease a caravel, or half-galley, on dry ground."

Their monkeys are also very numerous, and these are of several kinds, some are of a dark grey and very large, with black faces, and white beards that reach from ear to ear, which make them resemble old men. There is another sort like the former, and as large, but both their bodies and faces are milk-white; neither of these are mischievous: but there is a third sort that is very troublesome, these have white faces, and no beards, but have long hair on their heads like men: about harvest-time these come in large companies, and not only eat up a great deal of corn, but carry a considerable quantity of it away in their hands; they likewise plunder the gardens about the houses.

In some part of the island are alligators, and they have also a great variety of serpents, some of which are said to be of an incredible size. They have abundance of polecats, ferrets, weazels, and other vermin, which are so numerous, that they destroy almost all the wild rabbits.

The ants swarm here in an amazing degree, and sting so sharply that there is no bearing them; they devour almost every thing they come at, and people can scarce set down a dish of meat but it will be filled with them. They run up the walls of the houses, building arches or covered passages as they go; and if an arch happens to break, they come down and assist in repairing it. The Cinglasses take great care in watching every thing they value, lest they should be spoiled by these insects, which they discover by these arches of dirt, which they always build wherever they go. At a distance from the houses these ants raise hillocks, five or six feet high, of a pure refined clay, so firm and hard that it will require a pick-axe to break it, and under these they contrive their nests in the manner of an honey-comb. These insects increase prodigiously, and great numbers of them also die at a time; for when they have arrived at their full growth,

and have obtained wings, they issue out of an evening after sun-set in such vast numbers, that they darken the sky; and having flown out of sight, in a short time fall down dead, when the birds which are gone to roost frequently pick up a great many of them. The poultry live almost entirely upon these ants, which must greatly decrease their number.

They have one sort of bees like those common in England, these build in holes in the ground, and in hollow-trees. They have also a larger sort of a brighter colour, and that make much thinner honey: these fix their combs upon the boughs of trees at a great height, and as they may be easily seen, whole villages at the proper time of the year go into the woods to gather the honey, and come home loaded with it. They sometimes hold torches under the bees till they drop down from the trees, and then boil and eat them, thinking them very good food.

In this island are leeches of a reddish colour, of about the thickness of a goose quill; these appear about the time when the rains begin to fall, and soon after the grass and woods are full of them. At first they are almost as small as a horse-hair, and creeping up the legs of travellers, who always go without shoes or stockings, make the blood run down their heels; and if they have any sore, will be sure to get to it. To avoid this some rub their legs with lemon and salt, to make them drop off, and others use a flat stick to scrape them off; but they are so soon succeeded by others, that it is almost in vain, and they most commonly let them alone till they reach the end of their journey; for though their legs smart a little, this bleeding is esteemed salutary. When they come to their houses, they get rid of them at once by rubbing their legs with ashes.

As to fowls they have plenty of them; but it is said the king prohibits the people's keeping tame turkies, geese, ducks, and pigeons, though he himself keeps them: they have likewise a water fowl that is black, and as big as a duck; it lives upon fish, and will remain under water a long time, and at length will come up at a vast distance. There is another fowl that haunts the ponds and marshes; it lives on fish, and is larger than a swan.

There are a few partridges and woodcocks, some snipes, wood-pigeons, and sparrows; but wild peacocks and green parrots are very numerous.

The macowda speaks very plain, when taught, and is of the size and colour of a black-bird. There is another species of a very beautiful gold colour, and these too may be taught to speak.

The finest bird of this country is of the size of a sparrow; it is as white as snow, except its head, which is black, with a plume of feathers standing upright, and the tail is a foot long. There are others of a deep yellow, but in every other respect like the former; neither of them have any musical notes, or are good for any thing but to look at.

There is great plenty of fish in the rivers and ponds, which the natives eat with their rice much oftener than they do flesh. They take them with a wicker basket made in the form of a bell, which they put down in the water, and soon feel if there be any fish, by their beating against the walls of their little prison, and putting their arms in at the top, they take them out with their hands. They seldom use nets, except on the sea-coast. In several places fish are kept for the king's use, who diverts himself with feeding them: and in those places people are prohibited to take them, which renders them so tame, that they will swim after any body to the sides of the pond to be fed.

SECT. IV.

Of the Persons, Dress, Manners, and Customs of the Cinglasses, or Inhabitants of Ceylon.

THE Cinglasses are well shaped, of a middle stature, and have long black hair. Their features are regular, their complexion dark, but less swarthy than that of the Malabars, and their eyes, like those of all other Indians, are black.

Among the people of rank the young men wear their hair long and combed back; but when they are on a journey they tie it up. Elderly people wear a cap, that has some

some resemblance to a bishop's mitre. They suffer their beards to grow long, and wear a waistcoat of blue or white calicoe, and a piece of blue or stained calicoe round their waist, over which they have a fast, in which they stick their knife, which has generally a fine wrought handle: they also wear a hanger by their sides, the hilt of which is frequently inlaid, and the scabbard almost covered with silver. They walk with a cane, which sometimes has a tuck in it, and are followed by a boy, who carries a little bag, in which there is berel and areka. The common people are naked to the waist, about which they wrap a piece of calicoe that reaches down to their knees.

The women have their hair combed back and hanging on their shoulders, shining with cocoa-nut oil; a waistcoat, fixed close to their bodies shows their shape, and a piece of calicoe being wrapped about them falls below their knees, and is longer or shorter according to their quality. They wear jewels in their ears, in which they bore great holes: they also wear necklaces, and have bracelets on their arms, abundance of rings on their fingers and toes, and a girdle or two of silver wire or plate about their waists. Though they have a stately mien, they are very obliging to their inferiors, with whom they freely converse. When they go abroad, they throw a piece of striped silk over their heads.

They salute an acquaintance by holding out both their hands, with the palm upwards, and bowing their bodies; but a person of superior quality holds out but one hand, or perhaps only nods his head. The women salute by clapping the palms of their hands together, and lifting them to their foreheads; and the first enquiry is about their health, as it is here. When the nearest relations visit, they sit silent and reserved; for they are not fond of talking much. It is usual for them to carry provisions and sweetmeats with them to the house of their friend, who, however, makes an entertainment for them the first day; and if the guest stays longer than a night, he begins to assist the master of the house in his business; for they think it unreasonable that idle people, who have nothing to do, should disturb and hinder others as long as they please. But the people in general are not very able to make entertainments; for when they go abroad, they are obliged to borrow a great part of the cloaths and ornaments they then wear; which is so common, that they do not esteem it any disgrace.

The Cinglases are said not to want courage, they have quick parts, are of a complaisant insinuating address, and are naturally grave: they are of an even temper, and not easily moved; and, when they happen to be in a passion, are soon reconciled: they are temperate in their diet, neat in their apparel, somewhat nice in their eating, and do not indulge themselves in sleep; but, though they commend industry, they, like the natives of other hot countries, are a little inclined to laziness: they are not given to theft, but are intolerably addicted to lying, and pay little regard to their promises: they allow their women great liberty, and are seldom jealous: they are extremely superstitious, and great observers of omens. If at their first going out in a morning they see a white man, or a great belled woman, they promise themselves success in what they are going to undertake. Sneezing is an ill omen; and if they hear the cry of a certain little animal, like a lizard, they think it so unlucky, that they will defer what they were about till another opportunity.

Their principal food is rice, with some savoury soups made of flesh or fish. Those in affluent circumstances have six or seven dishes at their table; but most of them are soup, herbs, or other garden-stuff, and they have seldom above one or two of flesh or fish; and of these they eat very sparingly. The meat is cut in small pieces and laid by the rice; and instead of knives and forks they use spoons made of the shell of the cocoa-nut. They have bras and china-plates on which they eat; and the poor who want these, are contented with making use of broad leaves. If they have rice and salt in the house, the poor think themselves well supplied with food; for with rice, a salad, and the juice of a lemon, instead of vinegar, they will make a good meal. The eating of beef is prohibited, and they choose to sell their pork and fowls to the foreigners who come amongst them; and would think themselves hardly used, were they compelled to make a meal of either.

The wife dresses the food, and waits on her husband; and when he has done sits down with her children, and takes what is left.

Their usual drink is water, for they have neither wine nor beer, and drink but little arrack. They pour the water into their mouths, holding the vessel at a distance from their heads, without ever touching it with their lips.

Cock-fighting, and the game of draughts, are their usual diversions. The cocks of this island are larger, and their spurs much longer than in any other part of the known world; they fix to them large gaffs, and bet upon these occasions gold, silver, orchards, lands, and many other things, which are gained by the masters of that cock which is victorious. Their passion for play is carried to such an extravagant length, that at the game of draughts, it is even said, they venture not only all they have in the world, but even their very limbs. When they have nothing more to lose, they set a vessel full of sesame, or oil of nuts, for they have no olives, on the fire, and by its side a small ax, but very sharp. He who loses lays his hand upon a stone, and they cut off the joint of a finger, which is immediately dipt in the boiling oil, in order to cauterize the wound. This cruel operation cannot cure them of their bad habit of gaming, and sometimes they are so obstinate, that they will not give over till all their fingers are cut off.

SECT. V.

Of their Marriages and Divorces. The Treatment of their Wives; their Cruelty to their Children occasioned by their superstitious Regard to Astrology; and of their Funerals.

MARRIAGES, in this country, are usually concluded by the parents while their children are very young, without consulting them: but the same care is taken as in India, that the married couple be of the same cast or tribe. When every thing is concluded, and it is thought proper for them to cohabit, the young man sends his wife six or seven yards of calicoe, and a flowered linen waistcoat: if he carries them himself, they sleep together that night, and appoint a time for the solemnization of the wedding, or bringing her home. The evening before he takes her from her father's, he comes with his friends, bringing sweetmeats and other provisions, and they have a supper suitable to their rank, after which the bride and the bridegroom sleep in the same apartment. The next day after dinner the procession begins from the wife's father's to the husband's house, the wife at these solemnities always going before the husband. A few days after their friends and relations make them a visit, bringing provisions, and rejoicing on the happy occasion; but it does not appear that the priest is called in, even so much as to bless the marriage.

These contracts are far from being considered as indissoluble, for the parties, after trying one another's temper, are at liberty to part and match elsewhere, and this they will sometimes do two or three times over, before they fix on those they like; but as they give with their daughters portions of cattle, slaves, and money, either these, or an equivalent must be returned with the woman, the man keeping the male children, and the woman the girls.

Though no man is allowed more than one wife, it is said to be common for a woman to have two husbands, and those brothers, who keep house together, and the children acknowledge both for their father.

If their daughters are grown up, and marriageable, they make no scruple of letting young fellows lie with them, in hopes they will take them off their hands by marrying them.

The men are so complaisant after marriage, that if they are visited by a friend, they will offer him their wife or daughter to sleep with them, especially if he be of a superior cast, though it would be an unpardonable crime to prostitute either to a man of lower rank; and lying with a man's wife without his leave is even here, where they allow such liberties, esteemed so great a crime, that the husband is indemnified if he kills both the adulterer and the adulteress, when he finds them together.

It is said the women are very dexterous at procuring abortion, which they think no crime. They have no midwives, but the good women of the neighbourhood perform that office. The child is no sooner born than the astrologer is consulted to know whether it comes into the world under a lucky planet, and if they say that the hour is unfortunate, the child is exposed, thrown into a river, or given to somebody else; for though they suppose the child would bring misfortunes on the parents, they imagine, that he may procure happiness to a stranger. In short, from the prevailing superstition of the country, with respect to astrology, many people, who are afraid of the charge of children, are so cruel as to dispatch them, under the pretence that they are born under an unlucky planet. They give their children what names they please to distinguish them in their infancy; but when they grow up they take the name of the family or place to which they belong, or the employment or office they hold.

A person of rank no sooner dies than his corpse is laid out and washed, and a linnen cloth being thrown over it, it is carried out upon a bier to some high place and burnt; but if he was an officer of the court, the corps must not be burnt without the king's orders, which are sometimes not sent till a considerable time after. His friends in this case hollow the body of a tree, they put it in, filling up the hollow with pepper, and having made it as close as possible, bury the corpse in some room of the house, till the king sends an order for its being burnt. The corps is laid upon a pile of wood three feet high, and then more wood is heaped upon it; but if it be a person of distinction an arch is built over it, adorned with colours and streamers, and the whole is consumed together in the flames. Afterwards the ashes are swept up, the place fenced in, and a kind of arbour raised over it. The poor are usually wrapt in the mats they lay on, and attended by two or three friends, who bury them without ceremony in the woods.

Some days after a priest is sent for to the house of the deceased, who sings several funeral songs, and prays for the repose of his soul. The women, who are present, then let loose their hair, wring their hands, and vent the most passionate exclamations for the loss of their relation, enumerating all his good actions, and bewailing their own unhappy lot, in being forced to live without him; and this they repeat morning and evening for several days, the men standing by, and expressing their grief by their sighs and groans.

SECTION VI.

Of the Languages of the Cinglaffes, and their Skill in the Arts and Sciences.

THE Cinglaffes have a language peculiar to themselves, and also a learned or dead language, understood only by their bramins or priests, in which is written every thing relating to the rites and ceremonies of their religion. Their common tongue is copious, smooth, and elegant, and in all their addresses to their superiors, is a great mixture of compliment: they are so exact in the titles they give to men and women, that they are varied at least a dozen ways, according to the quality or circumstance of the people to whom they speak, and it is an unpardonable mistake to give any person a wrong title or epithet. Their very peasants are said to be as well versed in these praises as the men of rank, and make handsome speeches to ingratiate themselves where they have a favour to ask: to this they are used from their infancy, their parents taking all opportunities of introducing them into the company of their superiors, with whom they are taught to converse; so that they are seldom guilty of the rudeness or awkward baseness observable in the clowns of other countries.

Instead of paper they use the leaf of the tallipot-tree, which they cut into slips of about two feet long, and three fingers broad, and upon it form their letters with a steel bodkin, writing from the left hand to the right. Their children are first taught to write by making letters in the sand of the streets.

They are fond of astronomy, which they probably learned first from the Egyptians and Arabs, who have long had

a correspondence with this island. They even foretel the eclipses of the sun and moon, and make almanacks, in which they give the age of the moon, the lucky or unlucky times for ploughing, sowing, taking a journey, or entering on any business; and, according to the position of the planets, pretend to determine whether the sick shall recover, or a child at its birth prove fortunate or not. Their parents, it is said, always consult their astrologers on these subjects.

Their year, like ours, has three hundred and sixty-five days, and they begin it on the twenty-seventh, twenty-eighth, or twenty-ninth of March. They also divide the year into twelve months, and these into weeks; the first day of which they imagine to be fortunate, for the undertaking of any new affair. Their day is divided into thirty parts, and the night into as many, beginning the one at sun-rise, and the other at sun-set, which is here about six o'clock all the year round, so that their fifteenth part, or pay, as they call it, answers to twelve o'clock at noon. They have no clocks or sun-dials, but instead of them use a copper dish, which holds about a pint, with a little hole at the bottom: this is put empty into a vessel of water, and having filled itself in the space of one of their pay, it sinks, and then is set upon the water again, to measure another pay.

As to medicine, every body appears to understand common remedies, though none have any great skill. These remedies are composed of herbs, leaves, roots, or the bark of trees found in the woods, with which they purge or vomit themselves as they think proper; they also cure green wounds, and though the bite of some of their snakes be followed by certain death, if a speedy remedy be not administered, they apply an herb, which effectually cures the patient, and at the same time sing to him, which they call charming the patient. They have also many antidotes against poison taken inwardly; for as they abound in poisonous plants and herbs, providence has graciously ordained that they should have remedies of the same kind to prevent their dangerous effects.

The diseases to which the people are subject, are the small-pox, agues, and fevers, the bloody-flux, and pains in their limbs; for the last they use certain ointments with great success.

They seem perfect strangers to anatomy and bleeding, except bleeding with leeches, which, as hath been already observed, is in a manner unavoidable, and they acknowledge that they receive great benefit from it.

As to history, that of this island is recorded in the learned language; but instead of conveying any real instruction, it contains little else but fabulous accounts of their gods and ancient heroes removed to a state of bliss, and these they make the objects of their worship. These records are kept by their bramins in a language unknown to the vulgar, who know no more of them than what is communicated to them in songs and ballads, which they are always repeating.

SECTION VII.

Of their Houses, Furniture, Temples, and Fortifications.

THEIR towns are extremely irregular, and not laid out in streets; for every man encloses a spot of ground with a bank or pale, in which he builds his house. The dwellings of the generality of the people are low thatched cottages, consisting of one or two ground rooms; the sides are formed of splintered rattans, or canes, which are not always covered with clay, and when this is done they are not permitted to whitewash them, this being a royal privilege. The more wealthy people have a square in the middle of their houses, round which are banks of earth raised a yard high, on which they sit cross-legged, and eat or converse with their friends. They have no chimnies, but their meat is frequently dressed in the yards, or in the corner of a room.

Their furniture only consists of a mat, a stool or two, on which they set the strangers, to whom they would shew particular respect, a few china plates, and some earthen and brazen vessels, to hold their water, and in which they dress their provisions. They have one bed-

stead, for the master of the house to sit or sleep on, and this is platted with small canes, and has a mat or two, and a straw pillow, but neither tester nor curtains. The women and children lie by the fire-side on mats, covered only with a cloth they wear in the day-time; but they have a fire burning all night at their feet; for the poorest people never want fuel, there being such plenty of wood, that no-body thinks it worth his while to claim any property in it.

In the inland country are reckoned five capital cities. These are Candy, the metropolis of the island, and the residence of most of the kings, till it was taken and burnt by the Portuguese; but being too much exposed, the royal seat was removed to Neilembyneur a city, in the heart of the country. The third city is Alloutneur, which lies to the north-east of Candy. The fourth is Badoula, which is seated between three and four score miles to the eastward of Candy, and Digligineur, which is situated between Candy and Badoula.

Their ancient pagodas, or temples, are of hewn stone, with a multitude of images, both on the inside and without; but they have no windows. Their modern temples are little low buildings with clay walls, nearly in the form of a dove-house. They have likewise small chapels in their yards that are sometimes not above two feet square. These are set each upon a pillar four feet high, and having placed in it their favourite image, they light candles and lamps before it, and every morning strewing flowers about the idol, perform their devotions.

The inland country, called Conde Uda, is so well defended by nature, that it stands in need of no artificial fortifications, for on every side it is protected by mountains of a prodigious height, covered with thick woods, in which is left only a narrow path fenced at proper distances, where centinels are placed day and night. These fences are made of a tree, whose branches are set with thorns as long and thick, and almost as hard as a terpeny nail; these form a kind of gates, which are not made to shut like ours; but to lift up, like some old fashioned shop windows. They are of the nature of a portcullis; for when the natives are close pursued they suddenly let them fall, and then making a stand, fire through them, as well as from the thickets to the right and left; so that the shot and arrows sometimes fly as thick as hail, when there is not an enemy to be seen.

There are no wheel carriages in the country, at least among the Cinglasses; for if they had them it would be impossible to use them in the woods and mountains, while their ways are so narrow that two men can scarce go abreast. The king directs the roads to be kept in this manner, as the greatest security he has against the Dutch. The baggage of people of condition is carried by their slaves, and by others on their backs. There were no horses in the country till they were brought thither by the Portuguese, and it seems the king thinks it too great an honour to permit his subjects, or even foreigners, to ride on them in his territories; but they have oxen with bunches on their backs, which serve for carriage, and when the king and his court go a journey, the baggage is carried both by elephants and oxen.

SECT. VIII.

Of the Power, Forces, and Revenues of the King of Candy; with the Punishments inflicted on Criminals.

THE king of Candy, who possesses all the middle part of the island, is formidable to his subjects, by the absolute empire he has over their possessions, their actions, and their lives. The succession to the crown is hereditary, where the reigning prince does not limit it in his life-time, for he has the power of appointing any of his children to succeed him, and, if he sees fit, of dividing his dominions amongst them, as hath been sometimes practised.

The palace, where the king of Candy usually resides, is in the most retired and inaccessible part of the mountains near the town of Digligineur; it is composed of several buildings inclosed within a wall, and is so contrived, that it is not known in what distinct house or apartment he lies. His generals and great officers guard the inner courts,

where they have every night their fixed stations; and there they are obliged to remain without having any conversation with each other; and their troops lie without the walls. The guards nearest his person are composed of negroes, in whom he places the greatest confidence, and every night sends out parties at uncertain times, to see if the officers and centinels are at their respective posts.

He is chiefly attended by beautiful boys, whom the governors of the several provinces send to court, as they do young girls, who serve him for concubines, and to dress his meat for his table. Mr. Knox observes, that when he was in the country the king sent for all the handsome Portuguese women without distinction that could be met with, and having made choice of those he liked best, he sent back the rest, or had them placed in certain villages to be kept till called for.

When he goes abroad he is attended by a numerous body of guards, and among others has a company of Dutch, and another of Portuguese, under the command of officers of their respective nations: he is also proceeded by drums, trumpets, and other instrumental music, together with singing women, and has his elephants, led horses, and huntsmen with hawks, in his train. All this company frequently assemble by his majesty's order at the gates of his palace, in expectation of his going out, when he has no such design.

He eats by himself, sitting on a stool with a little table covered with white callicoe placed before him. Twenty or thirty dishes are brought into the room, by persons who have muffers before their mouths, and the king having a deep gold plate with a plantain-leaf at the bottom of it, calls for what he chuses, which is also brought him by a person muffled to prevent his breathing on the meat.

When his subjects enter into his presence they fall three times on their faces, and then sitting on their legs, address him in terms little inferior to those they use in their religious worship. One of their usual expressions is, "May your majesty be a god;" at the same time stiling themselves the limb of a dog, or some animal, which, they say, is unworthy to approach him, and when they retire from his presence, they creep backwards till they are out of sight.

He intrusts the management of most of his affairs to two great officers, styled Adigars, to whom his subjects may appeal from the judgment of the inferior judges or governors. Next to the Adigars are the Dissauvas, or governors of provinces, who are entrusted with the civil as well as military power. These reside at court, and manage their respective governments by a deputy, who has several inferior officers under him; but in every province some towns and villages are exempt from the governor's jurisdiction, as the lands which belong to the king, and the possessions of the priests.

The power of the king is restrained by no laws, so that he may do whatever he pleases. The lands are all holden of him by one tenure or other, some to serve him by their labours, others in his wars, and the rest pay certain quantities of their manufactures, cattle, grain, or fruit. In many villages this prince reserves the produce of the soil to himself, allowing only a bare subsistence to the husbandman; and these villages are frequently bestowed upon his officers, who enjoy them as long as they retain their posts. The rest of their lands are hereditary, descending from father to son, being only subject to the tenures by which they were held by their ancestors.

Three times a year the people bring their rents to court; and all who have any posts or offices in the government make presents to the king every New Year's-day of gold, precious stones, plate, arms, or callicoe. The great men strive to procure some valuable jewel, or extraordinary rarity, as the most certain way to procure their advancement, or, at least, to secure what they already possess. Besides these rents and annual presents, the king sends for whatever he pleases from any of his subjects; and if his officers appropriate any of their fruit-trees, or other produce of the earth to the king's use, the proprietor dare not touch them. Thus he commands the revenues and produce of all the lands in his dominions, whenever the exigences of the state induce him to call for them.

The king has no standing troops, besides his Coffee guards and a few Europeans. The common soldiers, who hold

hold their lands by a military tenure, mount the guard by turns, and the *dissauvas* and generals are constantly upon duty, either about the palace or in the field. These militia are all foot, and divided into bodies of about a thousand men each, under the command of one officer, called a *motal*. The king seldom trusts the command of the whole army to one general, but they act in separate bodies, which has sometimes proved very prejudicial, especially in his wars against the Dutch; but he chuses this as the lesser evil, from the apprehension that if any man should be intrusted with the command of all his forces he might dethrone him.

The soldiers are armed with muskets, broad-swords, pikes, bows and arrows; besides they have some little pieces of artillery, so light that three or four men may carry them on their shoulders.

Their tents are made of the leaves of the tallipot-tree, which they set up with tent-poles in much the same manner as the tents of our common soldiers. Every one carries his own provisions and baggage, and when their food is spent, they are allowed to go home for more; so that when they have been a month in the field, the army is generally scattered over the country to provide themselves with food: but, it is said, the Dutch, Portuguese, and other Europeans in this prince's service, have of late caused better discipline to be introduced.

They are not easily brought to venture a general engagement, without having an apparent advantage; therefore, in their wars with the Dutch, when the latter invaded any part of their country, they usually retired till they had drawn them into the defiles and difficult passes of the mountains, where they frequently surprized and cut them off, when they thought there was no enemy near. They had no sooner discharged their muskets and arrows, than they ran up into the rocks and woods, where no European could follow them, and waited till they found their enemy again entangled in the woods, and then never failed to renew the charge.

Though they have no other laws than the arbitrary will of the prince, he never suffers his governors to inflict capital punishments on the offenders; this he reserves to himself. He tries offenders in a summary way, and those whom he thinks guilty must suffer, let the proof be ever so slight. His elephants are frequently his executioners, by breaking the bones of the offender, or crushing him to pieces as they are directed: others are impaled; and those whom he suspects of having conspired against him are tortured, and not only the criminal but his father and the whole family are sometimes put to death, or reduced to a state of slavery.

For slight offences the greatest officers are frequently laid in irons, and afterwards restored to their posts, this being thought no disgrace; but the most usual way of punishing those who are intended to be restored, is banishing them to some distant village, where they remain confined till they are made sensible of their faults; but sometimes they are forgotten, and it proves an imprisonment for life.

SECT. IX.

Of the Religion, Temples, Idols, and solemn Festivals of the Cinglaffes.

THE Cinglaffes pay their adorations to one supreme God, the Creator of heaven and earth; and also prostrate themselves before the image of their saints and heroes, who, they suppose, have dwelt upon earth, and are now the ministering spirits of the Almighty Creator. The principal of these inferior deities they call Buddou, whom they imagine descended from heaven to procure the eternal happiness of mankind, and at length re-ascended from the top of that mountain called by the Portuguese Pico de Adam. They likewise worship the sun, moon, and other planets, which they imagine influence their fortunes. Every town has its tutelar deity, whose power is imagined to be only exercised over the inhabitants of the place; and besides these almost every person has his household gods, for whom they erect little chapels in their yards, placing lamps and strewing flowers before them, and offering them

rice and other food. These little mediators they address at least every morning, supposing that the person represented by the image has a powerful interest in the court of heaven. They also believe there are wicked spirits whom God permits to afflict mankind, and their anger they endeavour to avert by prayers and sacrifices.

It seems there are neither priests nor temples dedicated to the supreme God; these only belong to the inferior deities, of which they reckon three classes, and have several orders of priests to officiate at their respective altars.

The first are the *tiranaxes*, or chief priests of the god Buddou, who live in his *vehars*, or temples, which are endowed with great estates in land. These priests are always chosen out of the highest cast or tribe, and are superior to all others. They wear a yellow garment plaited like a vest, and a piece of the same cloth thrown over their left shoulder. They have long beards; but their heads are close shaved, and both their head and arms bare. They likewise wrap a large yellow sash about their loins, and carry in their hands a round fan fastened to a stick to shade them from the sun. The people bow down to the ground to these priests, in the same manner as to the images or their prince; and whoever they visit, a white cloth is laid upon a stool for them to sit on, an honour that is shewn to none besides, except those of the royal blood: their estates are also exempted from taxes.

As they are solely devoted to the service of their god, they are not allowed to have any secular employment. They are likewise debarred from having wives, or any commerce with women: they must neither drink wine, nor eat more than one meal a day; nor kill any animal. They are allowed to quit the priesthood, which some do in order to marry; on which occasion they only pull off the yellow garment, and throwing it into the river, wash themselves from head to foot: after which they become perfect laymen. These priests are styled the sons of the god Buddou, and their persons held so sacred that the king would be deemed an infidel should he presume to call them to an account for any crimes whatever; but, notwithstanding this, one of the kings caused some of these priests, who were found in arms against him, to be put to death. There are inferior priests of the god Buddou, who are called *Gonni*, and wear the same habit.

The second order of priests attend the temples of other saints and heroes, to which lands are likewise appropriated. These priests are also taken from the highest cast; but are not distinguished by their habit from the laity, except in having their cloaths always clean, and washing themselves whenever they officiate. They are allowed to follow husbandry and other employments, their revenues alone not being sufficient to maintain them. They however attend the service of the temples morning and evening, when the people bring boiled rice and fruit to the door of the temple, which the priest takes and presents before the idol: after it has stood some time the priest brings it out again, when the musicians who sing and play before the idols, and the other servants of the temple, with the poor who attend, feast together upon the offering.

The third order of priests are named *jaddeffes*, and their temples covels; these have no revenues, for any person that pleases may erect one of these temples, and be himself the priest, without any consecration. These seem to be the priests of their evil genii, and therefore, when the people are sick, they send for their *jaddeffe*, and dedicate a cock to the demon, whom they suppose the cause of their illness; but the owner keeps the cock till the priest thinks fit to sacrifice him. The people also apply to these genii as oracles, when the priest personating a fury, the people think him inspired, and proposing their questions, receive his answers as the voice of infallibility.

Whatever they sacrifice they never eat of themselves, it being distributed among the servants of the temple, the musicians, singing girls, and the poor.

The Cinglaffes assemble together for divine worship only at their solemn festivals, for at other times every one goes to the temple whenever he thinks fit; but on Wednesdays and Saturdays they particularly apply themselves to their deities, from the opinion that on those days they will be most propitious to their prayers.

A solemn festival is annually performed at the new moon in June; or July, called *Perakar*, and lasts till the full moon,

moon. In their principal cities there are at this time no less than forty or fifty elephants magnificently adorned and hung with brass bells, which march round the place and through all the principal streets, followed by people dressed up to represent the giants, who they say formerly inhabited the earth: then come drums, trumpets, and other wind music, with the dancing-men and women, who serve in their temples, in several companies; and after them two priests mounted on a stately elephant covered with white cloth and rich trappings, one carrying on his shoulders a painted staff, to which is fixed silk streamers and strings of flowers, and the other priests sitting behind him holds an umbrella over his head: then come two other elephants, on each of which are mounted two priests of the inferior deities, followed by the servants of the priests in all their finery: then advance some hundreds of women of the highest rank, richly dressed, and marching three a-breast. The streets are all the way adorned with flags, branches of cocoa-nut trees, and lighted lamps whether it be day or night; and the procession is closed by the generals with their troops and the great officers of state, who make the whole tour of the city, once in the day-time, and again at night, and this they repeat every day, from the new to the full moon. In the intervals nothing is to be seen but dancing, singing, and such sports as are suitable to great festivals.

Another annual festival is celebrated on the full moon in November, when they plant long poles before their temples, which they hang full of lights to a great height, as they also do before the king's palace. This festival lasts only one night.

At the new and full moon they present offerings to their god Buddou of rice and fruits; and on New Year's-day, which is in March, they perform a solemn festival to him on the mountain called Hammalella, or Adam's peak, or else under a certain great tree; and to one of these places all the people in the country think themselves under an indispensable obligation to go annually with their wives and their children, unless prevented by sickness, or any other accident. On that mountain, which is the highest ground in the whole island, they worship, and set lighted lamps round the print of the foot, which some say that Buddou, and others that Adam, left on his ascending to heaven, and lay their offerings on the top of the rock, which bears the impression, as upon an altar.

The sacred tree we have just mentioned grows in the north part of the king's dominions, at a place called Annurodgburro. This tree, like the chapel of Loretto, has travelled from one country to another, and at length planted itself at Annurodgburro. Under the branches of this tree, it is said, Buddou used to repose himself; and near this place are the remains of temples, hewn with incredible labour out of the rocks, and such as the people imagine could only be made by the race of giants they annually commemorate.

They esteem it a most pious act to procure temples to be erected to the honour of Buddou, and to offer sacrifices to him. Women of the best quality will send out their servants to beg the contributions of the people towards this sacrifice, and others for the same purpose will carry about his image, and to these the people are very liberal. On receiving any thing, they cry out, "Let the blessing of the gods and the Buddou go along with you; may your corn ripen, your cattle increase, and your life be long."

Others cause a temple to be built, and an image to be made, and then beg for money to pay the builder or founder. Before the eyes of the image are made, it is thrown about the work-shop as an ordinary piece of metal; but the eyes are no sooner finished than the idol is complete and sacred, and is removed from the work-shop to the temple, where it is attended with music, dancing, and sacrifices.

They have here, as well as upon the continent, idols of monstrous shapes and forms, made of silver, brass, and other metals, and sometimes of clay; but those in Buddou's temples are the figures of men sitting cross-legged in yellow habits, like his priests, representing some holy men, who, they say, are teachers of virtue and benefactors to mankind.

A prodigious number of idol temples of all kinds are dispersed over the country, some built of hewn-stone, and of excellent workmanship. These must have stood many ages, the people being entirely ignorant of this kind of architecture, and do not even know how to repair the decays occasioned in them by time. One at Vintane is one hundred and thirty feet in circumference, and of a very great height; at the bottom it is of an oval form; it rises to a point like a pyramid, and is gilt at the top.

S E C T. X.

Of their Trade and Manufactures; the Settlements of the Dutch; and the Coins, Weights, and Manufactures of Ceylon.

THE people of Ceylon have a little home trade, one part of the island supplying the other with what they want of the produce of their respective countries. There are however no markets held in the island; but they have a few shops in the great towns, where are sold rice, callicoe, brass, copper, and earthen vessels; swords, knives, and other instruments of iron and steel, in which they work very well; making all manner of tools for carpenters and husbandmen, and pretty good fire-arms. Their callicoes are strong, but not so fine as those of the coast of Coromandel: goldsmiths-work, painting, and carving, they likewise perform tolerably well.

The Dutch East India company are possessed not only of the whole coast of Ceylon, but of ten or twelve leagues within land. And as the Dutch, says commodore Roggeveen, take great pains to preserve a good understanding with the king, they obtain from him almost every thing they can desire. The company send to him every year an ambassador with presents, and, in return, his majesty sends the company a cabinet of jewels of such value, that the vessel which carries it home is thought to be worth half the fleet. The governor-general of Batavia takes care himself to have it so packed up among the rest of the merchandize, that not only none of the ship's company, but even the captain of the vessel that carries it, knows not whether it be on board his ship or no.

The two principal places in this island belonging to the Dutch East India company are Punta de Galo and Colombo; which last is the residence of the governor and his council. This city the Dutch have contracted into one quarter of its ancient bounds, and have fortified it with a wall and bastions. It is now about a mile in length, and three quarters of a mile in breadth. The streets of the New Town are wide and spacious, and the buildings in the modern taste. The governor's house is a noble structure, and several other houses are very beautiful.

The natives however do not pay any great respect to the Dutch, but rather treat them with contempt, scornfully styling them their coast-keepers. The Dutch give themselves little trouble about this, but, like good politicians, take all possible care to keep up a perfect correspondence with the king, that he may never be tempted to quarrel with and refuse them his assistance, which would destroy a most valuable part of their commerce. This, however, his majesty might do if he thought fit, without being under any great apprehensions from their power, since his dominions, as hath been already observed, are separated from theirs by such thick forests, that it is in a manner impossible to penetrate them.

The Dutch East India company, besides the advantage they make of the cinnamon, gain considerably by the precious stones found in this island; particularly rubies, white and blue sapphires, and topazes: they also receive considerable profit from the manufactures of muslin, chints, and other stuffs; but the greatest part of the muslins they send into Europe come from the coast of Malabar.

The Cinglaffes have very little coin, and therefore usually barter one commodity for another. When the Portuguese were established in the island they coined some silver, which the Cinglaffes call tangum massa; these are about the value of nine pence, and are still current all over the country. There is another coin which the common people themselves make, in the shape of a fish-hook, of a
finer

finer silver than dollars : and there is a third coined by the king, which being very thin, seventy-five of them make a piece of eight, or Spanish dollar ; and it is death for any person to coin or counterfeit these.

Their smallest weight is the colonda, six of which weigh a piece of eight, and twenty colondas make a pollam.

Their usual measure for cloth is the cubit ; and the least corn-measure is the potta, which is as much as a man can hold heaped up in his hand : four pottas make a measure called bonder nellia, or the king's measure : four measures make a courney, and ten courneys a pale, which is forty

measures ; four pales are an ommounas, by which they usually reckon their stock of grain. People, it is said, are not punished for making their measures too small, but for having them too large ; for corn frequently passing instead of money, the usurers make their measure as large as they can, that when they are paid they may receive the more from their debtors.

We have now surveyed the various islands rich in spices, gems, and gold, from the Ladrones to the east of Coromandel, and shall therefore return to the continent, and beginning with Tibet, proceed to Tonquin and the countries of India beyond the Ganges.

C H A P. XV.

O f T I B E T.

S E C T. I.

Its Situation and Extent; the Coldness of the Climate proceeding from the Height of the Land. The Country divided into the Provinces of Lassa, Great Tibet, and Little Tibet. The Boundaries of Lassa, the Produce of the Country, and a particular Description of the Roe-buck that produces Musk, and the Manner in which it is generated.

THE country called by the Europeans Tibet, or Thibet, is named by the orientals Tibt, and by the Tartars is called Barentola. This country, which some authors call Buton, is situated between the twenty-sixth and thirty-ninth degree of latitude, and is supposed to extend seventeen hundred and thirty-five miles in length from east to west, and where broadest seventeen hundred and eighty from north to south, though in some places it is not above half that breadth, in others scarcely a fourth part, and in others is still less. It is bounded on the north by the country of the Mongols and the desert of Kobi, on the east by China, on the west by Indostan, and on the south by the same empire, the kingdom of Ava, and other countries belonging to the peninsula of India beyond the Ganges.

The land of Tibet is in general very high. A mandarine, who had been there as envoy, informed a missionary, named Gerbillon, that in passing from China to Tibet he found a sensible ascent, and that the mountains, which are very numerous, are much more elevated on the east side towards China than on the west of Tibet : “ Certainly,” continues he, the little hills whence the golden river takes its rise must be vastly higher than the sea, since this river, which is sufficiently rapid, discharges itself into the lakes of Tsing-su-hay, and from those lakes the river Whangho has a very swift current for two hundred leagues before it falls into the Eastern Ocean. This elevation of the land renders the country very cold, considering the latitude ; but on descending the mountains, and entering farther into Tibet, the air is much more temperate.”

On the western part the air is also extremely cold, especially on the tops of the mountains which divide Indostan from Great Tibet. These mountains appear extremely dreadful, and naturally strike the mind with awe and terror ; they are heaped upon one another, and their summits are so contiguous, that they are scarcely separated by the torrents which rush impetuously down, and fall from the rocks with a noise sufficient to stun and terrify the boldest travellers. The road over them is commonly so narrow that the passenger can scarce find room to set his foot, and at the least false step he is precipitated down the precipices, where there are no bushes or shrubs to stop his fall, there not being so much as a plant or even a blade of grass on these desert mountains. Sometimes over the impetuous torrents that separate one mountain from another is a bridge, formed of a narrow tottering plank, or

ropes stretched across, and a bottom formed of twisted boughs.

The country generally comprehended under Tibet is usually divided into Great Tibet, Little Tibet, and Lassa. We shall begin with the last, which is bounded on the south by a vast chain of mountains covered with snow, and are no less difficult to pass than those already mentioned to the west of Great Tibet ; for the torrents, by which they are separated, are passed on planks laid on ropes stretched across them. On the east it is bounded by the countries of Kokonor and Tufan, which border on China ; on the north by the desert of Kobi ; and on the west by Great Tibet. The towns, both in this and in all the other parts of Tibet, are in general small, and none of them in a state of defence.

According to Tavernier the soil of this country is good, and produces rice and pulse ; and the chief commodities in which the inhabitants trade with other nations, are furs, particularly those of martens, musk, rhubarb, and worm-
feed.

The creature which produces musk resembles the roe-buck ; his skin and colour are the same ; he has also slender legs, and a split smooth horn, but somewhat bending. On each side he has two white teeth, which are straight, and rise above his muzzle, each about half a finger in length, resembling in form the teeth of the elephant. This is the mark which distinguishes this from other roe-bucks. The musk produced by these creatures in Tibet is much preferable to that of China and other countries, from this animal feeding on aromatic pastures, and also from the inhabitants of Tibet preserving the bladders of musk in the natural state, while the Chinese adulterate all that come into their hands.

The most excellent musk is what the roe-buck leave behind them, when they rub themselves against the rocks and mountains ; for the humour whence it is generated falling down towards its naval, gathers like a bile or any other tumour ; and when the swelling is ripe, the creature feeling a painful itching, searches for stones and rubs himself against them, till opening the sore, the matter runs out and coagulates. The wound closes, and the same kind of humour gathers to a head again as before.

There are men at Tibet who make it their business to collect this musk, and having gathered a quantity, put it up in bladders. The musk that has ripened in the skin of the roe-buck surpasses all others in goodness, just as fruit is better when it is gathered ripe from the tree, than when it is pulled green.

There is another method of getting musk by ensnaring the roe-buck in toils, and shooting him with arrows ; but these hunters frequently cut the tumours before the musk is elaborated, and in this case it has at first an ill scent, that prevails till the matter is thickened, which sometimes does not happen in a great while ; but as soon as it coagulates it turns to musk.

N n

The

The most excellent rhubarb comes from hence. This root they cut in pieces, and stringing them, hang them up to dry.

SECT. II.

The Persons and Dress of the Natives. Their Customs, Manners, and Religion; with a particular Account of the Dalay Lama, or Sovereign Pontiff.

THE inhabitants, according to Tavernier, are strong and well proportioned, but their noses and faces somewhat flat. Both sexes are clothed in summer with a large piece of fustian or hempen cloth, and in the winter with a thick cloth resembling a felt; on their heads they wear a kind of bonnet, much like our drinking-cans, which they adorn with boars teeth and pieces of tortoiseshell; but the wealthy intermix with them coral and amber beads, of which their women make necklaces. They all wear bracelets upon their left arms, and none upon their right: the women have them tight, and the men loose. About their necks they wear a silk twist, at the end of which hangs a bead of yellow amber, coral, or a boar's tooth, which dangles on their breast; and, on their left sides, their girdles are buttoned with amber or coral beads. Grueber says, the courtiers are very expensive in their dress, which consists of cloth of gold brocade. Some wear a habit in all respects resembling that of the women, except its being red like those of the lamas: but the common people are very slovenly.

With respect to their food, Tavernier observes, that they feed on all sorts of flesh, except that of cows, which they adore as the common nurses of mankind; and that they are fond of spirituous liquors.

The men are said to be restrained to one wife; and yet according to Regis, the women are allowed several husbands, who are generally related, and even sometimes brothers. The first child belongs to the eldest husband, and those born afterwards to the others, according to their seniority. When the lamas are reproached with this custom, they pretend that it is necessary in Tibet, on account of the scarcity of women.

The language of Tibet is said to differ entirely from that of the Mongols and Manchews, but that their characters resembles those that are in use among the people from the Caspian Sea to the gulph of Bengal; and consists of four vowels, twenty consonants, ten double letters, and ninety-six characters compounded with vowels.

The grand lama, who is also called dalay lama, or universal priest, was formerly sovereign of all Tibet; but as he now disclaims any concern with temporal affairs, he chooses one whom he constitutes governor in his stead, by the name of tipa. This officer wears the lama habit, which is generally of frize, with a yellow or red hat, but is under no obligation to observe the rules of the order, which are both severe and numerous: indeed no one lama undertakes to fulfil them all; but they divide the load among them. One adheres to the observance of particular precepts; another makes choice of other rules, and so of the rest; yet there are some prayers in common which they sing agreeably enough: but they are all obliged to live unmarried, and not to interfere with trade.

The principal city has the name of Lissa, as well as the province; but the grand lama does not live in it, his place of residence being one of the finest of the pagods, which are very numerous upon the mountain Putala. He sits cross-legged upon a large and magnificent cushion, placed upon a kind of altar, in which posture he receives the respects or rather adorations, not only of the people of the country, but of a surprising multitude of strangers who undertake long and painful journeys to offer him their homage upon their knees, and receive his blessing. Benrink says, that above twenty thousand lamas reside in several circles that extend round the foot of this mountain, according as the rank and dignity they possess render them more worthy to approach the person of the sovereign pontiff.

On the tops of the mountains trophies are erected to

his honour, that he may preserve man and beast; and all the kings who pay obedience to him, before their inauguration, send ambassadors with rich presents to obtain his blessing, as the means of diffusing happiness over their reigns.

Princes are even no more freed from the ceremony of kneeling at his feet, than the meanest of the people; nor does he treat them with more respect: for the grand lama thinks himself above returning any salute; he therefore never pulls off his bonnet, nor rises from his seat out of complaisance to any who approach him, let their dignity be ever so great; he only puts his hand upon the head of his adorers, who believe that by this means they receive the remission of their sins.

Grueber asserts, that the grandes of the kingdom have such veneration for this living god, that they are very eager to procure his excrements, which they wear pulverized in little bags about their necks as sacred relics, and that the lamas make great advantage by the large presents they receive from the great for helping them to this precious powder. Tavernier also declares, that those about the dalay lama preserve his ordure, dry it, and reduce it to powder, like snuff: then putting it into boxes, go every market day, and present it to their chief traders, who, having recompensed them for their kindness, carry it home as a great rarity, and when they feast their friends, strew it upon their meat. These accounts appear at first sight highly improbable; we cannot without difficulty believe human nature so degraded, and it appears much more natural to suppose, that those travellers were mistaken, and led into an error by their little knowledge of the language of the Tibetians; especially as the greatest errors may be occasioned by the dubious sound, or equivocal meaning of a word.

The high opinion which both the princes and people of this large country entertain of the power and holiness of the dalay lama, make them readily submit to the most servile rites. They believe that the god Fo lives in him, and that he knows all things, sees all things, and penetrates into the very secrets of the heart; and that if at any time he condescends to ask any questions, he does it only for form sake, that he may leave the infidels without excuse. They are even persuaded that when he seems to die he only changes his abode, being born again in a new body, and that nothing more is to be done than to discover what body he is pleased to inhabit. The Tartarian princes sometimes engage in this search, yet after all are obliged to refer it to the lamas, who alone understand the marks by which he is to be known, or rather know the child whom the succeeding grand lama had appointed to be his successor.

The principal image worshipped by these people is named Manippe, and is represented with nine heads, placed so as to form a cone, with only one head at the top. Before this idol the people perform their sacred rites, with many odd gesticulations and dances, often repeating, O Manippe mi-hum! O Manippe mi-hum! that is, O Manippe, save us! To appease and conciliate the favour and esteem of this deity, they frequently place before this idol, various sorts of meat.

Grueber mentions a most detestable custom introduced into this country and Great Tibet. They chuse, says he, a lusty youth, to whom, on certain days they grant the liberty of killing without distinction whomsoever he meets; for those whom he thus slays, being consecrated to Manippe, are supposed to obtain immediately eternal happiness. This youth, whom they call Fut or the Slayer, is clothed in a gay habit, adorned with little banners; and armed with a sword, quiver, and arrows. At the time appointed he sallies furiously out of the house, and wandering through the ways and streets, kills people at his pleasure, none making any resistance.

The number of lamas in Tibet is incredible, there being hardly a family without one, either from devotion, or expectation of preferment in the service of the dalay lama. This dignity, however, is not confined to the inhabitants of Tibet, other nations may arrive at that honour, and there are Tartars, and even Chinese, who resort to Lissa to obtain it; and those that arrive at the rank of the disciples of the dalay lama, who are not to exceed two hundred,

dred, consider it as a great happiness. From among these the khutucktus or superior dalay lamas are chosen, and they no sooner obtain that honour, than plenty pours in upon them from a croud of adorers, who come to them from all the neighbouring countries.

As to their character, the missionaries, who are their great enemies, say, that they are debauched, and yet govern princes, who give them the chief place in assemblies. Some of them, they add, are tolerably skilled in medicine; others have some notions of astronomy, and can calculate eclipses. But only a few of them can read or understand their sacred book, or even say their prayers, which are in an ancient tongue and character, no longer spoken, though there are said to be in Tibet universities and colleges for teaching their law, and the principles of their religion.

But Bentink gives a much more favourable account of them, and says, they both teach and practise the three great and fundamental duties of honouring God, offending nobody, and giving to every one his due; and that he was informed by some travellers of credit, that they strenuously protest against adoring more than one God: that the dalay lama and khutucktus are his servants, to whom he communicates knowledge for the instruction and good of mankind: that the images which they honour are only representations of the deity, or of some holy men; and that they shew them to the people only to remind them of their duty.

After all it is acknowledged, that the religion of Tibet resembles that of the Roman church in so many particulars, that one would imagine the church of Rome borrowed her ceremonies from them, or that they borrowed theirs from Rome. Gerbillon says that they use holy water, a singing service, and praying for the dead; that their dress resembles, that in which the apostles are painted; that they wear the mitre and cap like the bishops, and that their dalay lama is nearly the same among them, as the sovereign pontiff among the Romans. Grueber goes much farther, and maintains, that though no European or Christian was ever there before him, yet their religion agrees with the Romish in all essential points; among other things he mentions extreme unction, making processions in honour of reliques, their several fasts, their undergoing severe penances, and, in particular, scourging themselves; their consecrating lamas, who have a kind of episcopal jurisdiction, and their sending out missionaries, who live in extreme poverty, and travel bare-foot through the deserts as far as China. To conclude, friar Horace says, that the religion of Tibet is the counterpart of the Romish. They offer, says he, alms, prayers, and sacrifices for the dead, have a vast number of convents, filled with monks and friars, amounting to thirty thousand, who, besides the three vows of poverty, obedience, and charity, make several others. They have their confessors, who are chosen by their superiors, and have their licences from their lamas, without which they cannot hear confessions, or impose penances. To these may be added the use of beads, and of holy water.

The reader will find, in the prosecution of this work, that the pagans, or, as they are usually called, gentoos of India, also resemble the church of Rome, and that they practised the same ceremonies before the more enlightened parts of the earth were blessed with the knowledge of Christianity.

Before we conclude this section it will be proper to add, that the Kalka Mongols were formerly subject to the dalay lama, and that the reader may find some particulars that have a relation to the superstitions of this country, in our account of the religion of that people, in the seventy-fourth and seventy-fifth pages of this volume.

What has been said above, more particularly relates to the province of Lassa. We shall therefore now proceed to describe Great and Little Tibet properly so called.

S E C T. III.

Of the Provinces of Great and Little Tibet.

THE bounds of Great and Little Tibet none have undertaken to define: only Desideri the jesuit observes, that Great Tibet lies to the north-east of Kishmar, and begins at the top of a frightful mountain, named Kantel, that is covered with snow. The weather, as in the province of Lissa, is very severe, and from the same cause, the great elevation of the land, which, however, produces wheat and barley, but scarce any trees, fruit, or roots.

The inhabitants are naturally gentle and teachable; but ignorant and unpolite; and though they are not destitute of genius, are unacquainted with arts and sciences. They wear nothing but woollen: their houses are small, narrow, made of stones piled rudely one upon another, and trade is usually carried on among them by exchanging provisions. They coin no money, and the only specie current among them is the Mogul's coin.

Great Tibet carries on a small trade with the neighbouring kingdoms; its principal commodities are very fine wool of two sorts, one of sheep; but the other, which is called tour, is rather a kind of hair, like the fur of the castor: the other commodities are musk, crystal, and jashen, which is a blueish stone with white veins, so hard that it must be cut with a diamond: this stone is highly esteemed at the court of the Great Mogul: they make of it cups, and other vessels, which are sometimes inlaid with gold.

As to the religion of Great Tibet, a small part of the country is inhabited by Mahometans, and the rest by pagans, who are said to be less superstitious than those in other idolatrous countries. They call the supreme god Conchock, and adore another deity whom they name Urghien, and say, that he was both god and man, without father or mother, but born of a flower, and yet they have the statue of a woman, who holds a flower in her hand, who they say is Urghien's mother. They likewise adore saints, and make use of beads. No sort of meat is forbidden them; they reject the doctrine of the transmigration of souls and polygamy, in which points they differ from the Indians. Their lamas wear a different habit from that of the laity. They neither braid their hair, nor wear pendants in their ears, like the others, but have the tonsure, like Romish monks, and are obliged to practise perpetual celibacy; they study the books of their law, which are written in a language and character different from the vulgar. They chant their prayers, and present their offerings in the temples, consisting of wheat, barley, dough and water, in neat little vessels; and these offerings they eat in a religious manner. They are held in great veneration, and usually live in communities. They have local superiors, and over them a superior general, whom the king himself treats with great respect.

There is only one absolute prince in this country; he who reigned in 1715, was named Nima Nanjal, and had under him a tributary king. The missionaries who were then there first visited the prime minister, who was intitled the king's right hand, and afterwards had several audiences of his majesty, who received them sitting on his throne.

Little Tibet is a mountainous country, situated to the north-west of Kishmir, a northern province of Indostan, and is bounded on the east by Great Tibet. According to Desideri, it is one hundred and eighty miles in length, and one hundred and sixty in breadth. It is mountainous, and the snows lie deep during the winter; but in some places it produces very good fruit, especially melons. Its capital city is named Eskerdu; the inhabitants are chiefly Mahometans, and the princes, who govern them, are said to be subject to the Great Mogul. In short, the people are poor, and their only articles of commerce are a little crystal, musk, and wool.

S E C T. I.

A general View of the Peninsula of India beyond the Ganges. Of the Situation, Extent and Climate of Tonquin. Why the Countries just within the Tropics are better than those under the Line. A particular Account of the wet and dry Seasons, and of the Typhoons, or periodical Hurricans.

WE are now entering the farther peninsula of India beyond the Ganges, which is situated between the ninety-second and hundred and ninth degree of east longitude, and between the first and thirtieth degree of north latitude, extending two thousand miles in length, and one thousand in breadth. It is bounded by China and the Chinese sea on the east; by Tibet and part of China on the north; by the bay of Bengal and Hither India on the west; and by the Chinese sea and the freights of Malacca on the south: and contains on the north-east Tonquin and Laos; on the south-east Cochin-China, Cambodia, and Chiampa; on the north-west Acham, Ava, and Aracan; and on the south-west Martaban and Siam.

A range of mountains extends from north to south thro' almost the whole length of the country; but near the sea the lands are low, and in the rainy season are annually overflowed. Its bays are those of Cochin-China, Siam, and Malacca; its freights those of Malacca and Sincapora; its promontories those of Banfac, Romana, and Siam. Its principal rivers are the Domea, in Tonquin, which running from north to south discharges itself into the gulph of Cochin-China; the Mecon, which rising in the north, runs through the kingdoms of Laos and Cambodia, and falls by two channels into the Chinese sea; the Menan, which also runs from north to south, and passing through Siam, falls into the bay of Siam; and the river Ava, which falls into the bay of Bengal.

Tonquin is a kingdom situated to the east of China, from which it is separated by inaccessible mountains; it is also bounded on the east by the bay of Cochin-China; by that kingdom on the south; by the kingdom of Laos on the west; and by part of China on the north, where it is also bounded by lofty mountains. It extends from seventeen degrees north latitude to twenty six degrees thirty minutes, and between the hundred and first and hundred and eighth degrees of east longitude; being five hundred miles in length, and four hundred in its greatest breadth; but in some parts it is not half so broad.

This kingdom is divided into eight provinces, which are Cachao, North Province, West Province, Ngeam, Tenhoa, South Province, East Province, and the Province of Tenan.

The climate is excessive hot, the fields and woods have always the appearance of spring, and the air is for the most part extremely healthful. The seasons of the year, as in other countries between the tropics, instead of winter and summer, are divided into wet and dry. The weather does not alter all at once, but at the close of the dry season, gentle showers falling now and then precede the violent rains, and towards the end of the wet months several fair days shew the approach of the dry season.

As to heat and cold, it is worthy of remark, that the countries which lie near the tropics, and particularly those that are three or four degrees within them, are much hotter than those which lie under the line; for which Mr. Dampier justly assigns the following reasons: Under the equator the days and nights are always twelve hours long; but near the tropics the longest day is thirteen hours and a half, and an hour and a half being taken from the night create a difference of three hours. Secondly, at those places which lie three degrees within the tropic, the sun comes within two or three degrees of the zenith in the beginning of May; and having passed the zenith, does not proceed above three degrees farther before it returns again; so that it is at least three months within four de-

grees of the zenith, and the sun is almost vertical from the beginning of May to the latter end of July. On the other hand, when the sun enters the equator it immediately hastens north or south, and his stay being so short the heat cannot be so intense as near the tropic, where he continues so long almost vertical, and is every day so much longer above the horizon, while the nights are so much shorter than they are under the line.

The wet season commences at the end of April, or the beginning of May, and continues till about the end of August: during this time there are violent rains, sometimes for many hours, and at others for many days, without ceasing; but there are considerable intervals of fair weather. These rains occasion great land floods in all the countries between the tropics. In August the weather begins to be more moderate, both as to rain and heat; though some showers then fall. The air is more temperate in September and October, and yet between the beginning of August and the end of October are the violent storms called typhons, and vulgarly tyffoons, which usually happen about the full or change of the moon, and are preceded by very fair weather, gentle winds, and a clear sky. These small winds veer from the common trade-wind, which at this time is south west, and flutter about to the north or north-east. A dreadful cloud is seen sometimes twelve hours before the storm begins; but when the cloud moves swiftly, the storm may suddenly be expected. It usually blows twelve hours with great violence to the north-east, attended with claps of thunder, great flashes of lightning, and excessive rains; but suddenly abating falls quite calm, and having continued to about an hour, the wind veers to the south-west, and blows with as much fury from that quarter as it did from the other.

November and December are dry, healthful and very pleasant months. January, February, and March are for the most part dry; but in the mornings there are thick fogs, and sometimes cold drizzling rains: the air is likewise very sharp in January and February, especially when the wind is in the north-east; and in April the weather is moderately dry and exceeding temperate.

Though this be the general state of the year, yet the seasons sometimes alter a month or more, and the rains are some years more lasting and violent than in others, nor have they always sufficient rain for the rice. Tonquin, like other countries between the tropics, depends on the annual floods to moisten and enrich the earth; and if these fail they have hardly any crop, and the poor are reduced to such distress, that they are forced to sell their children to preserve their own and their lives. But this is not so often the case here as it is on the coasts of Coromandel and Malabar.

The low lands also sometimes suffer by too great rains, particularly if they happen unseasonably; but as their dry lands yield better crops, they are not in such danger of famine; and indeed the poor, who are very numerous, oftener perish for want of employment, and a proper care being taken of them, than from a scarcity of provisions.

S E C T. II.

Of the Vegetables and Animals of Tonquin.

TH E country has but little other grain besides rice. If the rains are seasonable they have two crops every year, and the floods save them the labour of watering their rice fields. They are not much concerned if their grounds are overflowed in harvest; for, notwithstanding this, they will reap their corn and hang it up in little bundles till it is dry, which it will soon be in this hot country.

Their up-lands are over-run with purslane, which they are forced to weed out of their grounds, because it prevents

vents the growth of other herbs and plants. They have yams, potatoes, and onions in their gardens; and among their fruits they have pine apples, guavas, mangoes, plantains, bonanoes, cocoas, limes, and two sorts of oranges, large and small. The large oranges have a fragrant smell and most delicious taste, and may be freely eaten without danger: these are admired by some travellers as the best in the world. The other is a small round fruit, with a smooth thin rind, and a deep red both on the inside and without. Their taste is almost as agreeable as that of the other; but they are said to be very unwholesome and to occasion the flux. In this country oranges are in season from October to February. The limes, which are round, have smooth thin skins, and are as large as an ordinary lemon: they are full of juice, but it is not near so sharp as that of the lesser limes of other countries.

The betel leaf, so much valued all over India, is very common in this country. There is great plenty of mulberry-trees, for the people plant young slips every year, the tender leaves of which being esteemed much better for the silk-worms than those of old trees. They seldom mind the fruit, which is small, and worth but little.

Here is also good timber for shipping, the building of houses, and other purposes; and pine-trees, which serve for masts.

In the woods towards the north of this country are elephants of an extraordinary size: they have few horses; but plenty of cows, buffaloes, and an abundance of hogs. There are no lions, asses, or sheep, except a few of the last that are kept for the king's use. The deer and harers of this country are very scarce.

This country affords great plenty of wild and tame fowl, but there are few small birds. The natives used formerly to catch their wild ducks in nets, till the English and Dutch coming amongst them, taught them the method of shooting.

There are here a kind of locusts, about as large as a man's finger; these breed on the banks of their rivers and ditches, and are esteemed good food by the natives. There are also great swarms of gnats, which are extremely troublesome, and a species of ants that are very mischievous.

S E C T. IV.

Of the Persons, Dress, Food, Manners, and Customs of the Inhabitants; with a particular Account of the Manner of chewing the Betel Leaf, with Areka, or Arek. Of their Marriages and Funerals.

THE Tonquinese are of a tawny complexion, but not so dark as many of their Indian neighbours; they are clean limbed, of a middle stature, and have long black hair, which grows very thick, and hangs down upon their shoulders: their nose and lips are well made, and their faces are of an oval form, but somewhat flattish. When they are about twelve or thirteen years of age they dye their teeth black, or of a very dark colour; this is an operation that takes up three or four days, during which they hardly dare to take any nourishment, the composition being so nauseous, and some say poisonous. It is observed, that they are ashamed of having white teeth, like the brutes; on which Mr. Salmon observes, that the true reason of their blacking them is doubtless the prevailing fashion of the country, which, how ridiculous soever it may appear to foreigners, must constantly be followed by the inhabitants, unless they would be pointed at and insulted by the vulgar, as well as by people of better fashion.

The sexes are not distinguishable by their habits. Their outer garment is a long gown, bound round the waist with a sash. The quality usually wear silk, but prefer English broad-cloth, either red or green, with caps of the same stuff. The inferior people and the soldiers usually wear cotton cloth, dyed of a dark colour, and the upper garment of the latter reaches no lower than their knees; but they wear drawers which come down to the middle of their legs. The poor generally go bare-headed, except in the rainy season, when those who are exposed to the weather

use broad brimmed hats made either of palm leaves or reeds. The poor seldom wear any thing but a doublet and a pair of drawers, without either shirt, shoes, or stockings. They sit cross-legged, and round the rooms where they make their entertainments, they have a sort of couches covered with fine mat, and raised about two foot from the ground. On these their friends sit, having a cushion under them, another at their backs, and an alcove over their heads. They are said to be remarkable for their social disposition and hospitality.

As to their food, their most common dish, except boiled rice, consists of small pieces of pork spitted together and roasted. They also eat beef, buffaloes flesh, and the flesh of horses, goats, dogs, cats, fowls, and locusts; with all sorts of fish, eggs, herbs, and roots.

They sometimes mince their raw pork, and making it up in balls like sausage-meat, eat it without any other dressing. They singe their bullocks, and having steeped slices of raw beef in vinegar, eat it with a particular relish. They think horse-flesh as good as beef, and the poor make no scruple of eating the flesh of elephants that die a natural death, and often make a present of the trunk to some great man, as a delicious morsel. Frogs are also esteemed a great dainty.

They have plenty of turtle, crabs, craw-fish, shrimps, and prawns; and have a fish like an anchovy, which they pickle. They throw their small fish and shrimps into a jar of water and salt made very weak, and after it has stood a little time it is reduced to a mass, which they call ballachaun; afterwards they draw off the liquor, which both the natives and Europeans use as sauce. The poor eat the ballachaun with their rice, which would be very insipid without something to relish it; and therefore, when they have no ballachaun, they eat salted eggs or dried fish with it.

People of distinction have generally flesh, fowl, and fish at their tables every day. Their meat is served up in little trenchers of lackered wood, ten or twelve of which are brought in a kind of vorder, of the same lackered ware. They cut the meat into small square pieces, and eat it with their chop-sticks as in China, using neither linen, spoons, knives, nor forks.

The people have a method of keeping their eggs several years, by inclosing them in a paste made of ashes and salt brine, and kept in an earthen-pot close stopped. These they eat with their rice, when they live upon the water, taking about the quantity of a hazle-nut with every mouthful of rice.

Their most usual liquor is tea: they have also a kind of arrack, which they sometimes drink with their tea, and sometimes by itself; but it is the worst and most unpalatable that is to be found in India: they however, 'tis said, think it a great cordial, especially after they have infused scorpions and snakes in it; for thus rectified they esteem it an antidote against poison, and think they shew the greatest respect to their friends when they treat them with this liquor.

When any one comes to visit them, betel and areka are immediately presented: in the leaf called betel they wrap several slices of areka-nut, and having daubed it over with chinam, or lime made into mortar, they chew it as our people do tobacco.

The dose, if I may so call it, says Mr. Grose, must necessarily consist of these three ingredients, the betel-leaf, the areka, arek, or betel-nut, and chinam; for wanting any of these that deep red colour which results from their mixture in mastication would also fail.

The betel-leaf is something like that of a laurel, and grows upon poles like hops. The leaf is full of large fibres, which, with that of the middle, they generally strip off with the nail. It has a hot biting taste, not unpleasing when one is used to it.

The areka, or arek nut, is exactly of the form and size of a nutmeg, only harder; marbled in the inside with white and reddish streaks; insipid to the taste, and must be shredded with a kind of scissars, which they are never without for that purpose, so as to wrap it up with the leaf. They use it both raw and boiled, which last they say preserves and adds strength to it. But I will not advise any one to taste it green, since it affects the animal spirits so

powerfully,

powerfully, that instantaneously, as it were, those who are not used to it fall down as in a trance; it is true they recover presently, and without any ill consequences.

Chunam is only a lime burnt, and made of the finest shells. For use it must be wetted, exactly as if to serve for mortar, and is kept in gold, silver, or metal round boxes.

To these three articles is often added, for luxury, what they call cachoonda, a Japan-earth, which, from perfumes and other mixtures, chiefly manufactured at Goa, receives such improvements as to be sold to advantage when re-imported to Japan. It is made up in little round cakes of scarce the breadth of half a crown, but somewhat thicker. The surface is a dark dingy brown, the mass of a brittle gritty texture, and breaks white. The taste is at first little better than that of common chalk; but soon turns to a flavour that dwells agreeably upon the palate.

Another addition too they use, of what they call catchoo, a blackish, granulated, perfumed composition, of the size of small shot, which they carry in little boxes on purpose. It has a pleasant taste, and is reckoned a provocative when taken alone, which is not a small consideration with the Asiatics in general.

They pretend that this use of betel sweetens the breath, fortifies the stomach, though the juice is rarely swallowed, and preserves the teeth, though it reddens them; but, we are apt to believe, there is more of a vicious habit than any medicinal virtue in it; and that it is like tobacco, chiefly matter of pleasure.

The great men have fine gilt lackered boxes for these doses of betel and areka, which are constantly offered to the stranger as soon as he enters, and must be accepted on pain of being thought unmannerly; and this must be taken with the right hand, the left being seldom employed but in the vilest offices. Among this people, and indeed all over India, a man's being left handed is the greatest misfortune; for it would be impossible for him to gain their esteem, though his qualifications were ever so extraordinary.

The Tonquinese, especially the trading part of them, are courteous and obliging to strangers: they are fair dealers, and not, like the Chinese, addicted to cheating and tricking; yet their magistrates are said to be proud and imperious, their soldiers insolent, and their poor are far from having that honesty which is so amiable in the merchants and tradesmen: these poor are a numerous body, and so given to thieving, that strangers are forced to watch their goods with great care. The Tonquinese, however, are esteemed good mechanicks, and faithful and obliging servants: they are patient in labour, but dejected in sickness; and, from the highest to the lowest, are so fond of gaming, that nothing can restrain them.

Their usual diversions are fishing and hunting, but principally the latter; their rivers and sea-coasts abounding with excellent fish. The country is the less proper for hunting on account of the many rivers that run through it, and the little cover there is for game.

The people generally travel by water, on account of their enjoying the convenience of the many rivers; however, their highways and bridges are kept in very good repair: and though they have no public inns, yet the traveller is sure to meet with water and fire by the road-side, and to find other conveniences proper for dressing his meat and refreshing himself.

When their generals and great men take the field, their baggage is usually carried by elephants, and it does not appear that they make use of any other beasts of burthen.

Men purchase their wives, and the people are allowed to have what number of them they please; but, in time of scarcity, the poor are frequently compelled to sell both their wives and children for food. Men of the best quality in Tonquin offer their daughters to the merchants and officers who come to trade there, though they are sensible they will stay only a few months. One great inducement is said to be the hopes of mending the breed, and having their posterity of a whiter complexion than themselves; for they think the nearer they approach to white, the greater is their beauty. The women make no objection, and think this as lawful a way of getting money as any other; and if their children should prove burthensome, and they in circumstances that will not admit of their supporting them, they make no scruple of selling them.

The people are very profuse in their weddings, and the men must be poor indeed whose marriage-feast does not last three days; yet they may divorce their wives for a very slight offence: but the woman has not the same privilege, for she cannot get rid of her husband, except he be guilty of some very notorious crime: however, the man is obliged to restore the goods he had with his wife, and to keep the children. If a woman be convicted of adultery, she is exposed to an elephant, bred up for these executions; and he having tossed her up in the air, she no sooner falls than he tramples her to pieces.

The Tonquinese do not burn their dead, but they have no common burying-places, for every one is interred in his own ground; and within a month after a great feast is made at the grave, at which the priest is present. If the deceased was a man of quality, a wooden tower is erected over his grave, seven or eight feet square, and about twenty-five feet high: thither the country people repair, and find great plenty of provisions in little sheds, or houses, built at about twenty yards distance from the tower. The people being assembled, the priest ascends that structure, and makes a speech upon the occasion; after which he comes down, and the people set fire to the tower, which, being slightly built and covered with thin painted boards, is soon consumed. This being done the people eat and drink, and are very merry. Dampier says, he was at one of these solemnities, when he saw fifty or sixty hogs cut up, and the greatest quantity of oranges brought for the entertainment of the guests that he had ever seen at Tonquin.

SECT. V.

Of the City of Cachao, the Form of the Houses, and their Furniture; the King's Palaces; with the other Towns and Villages of Tonquin.

THE city of Cachao stands upon a rising ground on the west side of the river Domea, and is defended by neither bank, wall, nor ditch. It contains about twenty thousand low built houses, raised with mud walls, and thatched roofs; with a very few built with brick and tile. The rooms are only divided by partitions of split cane, and have no other light than what they receive from a little square hole. Their furniture consists of cabinets, tables, and stools; and, in their innermost rooms, an ordinary bed or two. Every man has in his house a small altar, upon which is an image and two incense-pots, and before it he performs his devotions. They usually dress their meats in their yards, or before their doors; but in the rainy season make use of one of their outer rooms, where, for want of a chimney, they are almost blinded with smoke. The principal streets are wide, but in wet weather are very dirty; and there are several ponds and ditches, which in the dry season become very offensive: but, notwithstanding this, the town is esteemed very healthful. In every man's back-yard, or in some convenient part of his house, is a small arched building, in the form of an oven, about six feet high, to secure his best goods in case of fire, to which their thatched houses are very subject; but the government obliges every man to keep a great jar of water at the top of his house, with buckets; and if the fire cannot be extinguished this way, they throw off the thatch, which is contrived in large panes of seven or eight feet square, that can be removed at once: they also keep hooks, like those used by our firemen, to pull down the buildings that are in flames. Those persons are severely punished who neglect to have their jars of water, their buckets, and hooks in order.

In the city of Cachao are three palaces, in the chief of which the boua, or king, resides. This structure is said to be of a prodigious extent, and has a wall about fifteen feet high, and as many in thickness, faced on both sides with brick; besides the buildings and apartments of the king and his courtiers, there are within the wall, parks, gardens, and canals, as at the palace of China.

The two other palaces in this city are but meanly built; in one of them the choua, or general, resides: before it is a spacious square parade, with a building that runs along

one side of it, in which the generals and other officers sit to see the soldiers perform their exercise. Opposite to it is another low building, in which is kept the train of artillery, consisting of about fifty or sixty iron guns, and some iron mortars. Near this place is a stable of two hundred elephants kept for war, and to carry the generals and their baggage; there is also another stable, in which are about three hundred horses.

These are the only buildings worth notice in the city of Cachao. The English factory, which stands at the north end of the city, is but an ordinary low built house, and yet is one of the best in the town. The Dutch factory joins to it, but is not quite so large.

The other cities of Tonquin are but few in number, Hean is one of the chief, and consists of about two thousand houses, and, like all the rest, has neither wall nor ditch. They have no market-towns, but every five or six villages have the market in each by turns. These villages consist of thirty or forty houses; they are scattered pretty thick all over the country, and are always surrounded by groves, and in the flat country high banks are thrown up beyond these groves to prevent their houses and gardens being overflowed in the wet season. When the dry season returns, the moles, which surround the villages, serve to fill those canals with water, that separate their grounds, and every house standing in the midst of a garden, thus surrounded by trees and water, enjoys a very agreeable situation. In the hilly country the people have no moles or banks thrown up about their villages, and therefore may be supposed to be much more healthful in the wet season than those who live in the plains.

SECT. VI.

Of the Temples, Religion, and Superstition of the Tonquinese.

THEIR religion nearly resembles that of the Chinese, and they express the same reverence for Confucius, which is not at all surprising, as Tonquin was anciently a province of that kingdom. They have a great variety of idols, the most common of which are the horse and the elephant. Their pagodas, or temples, in the country, are mean wooden buildings, covered with thatch, and sometimes but just big enough to hold the idol placed in them; but in their great towns they are something handsomer.

Their priests lead a very austere life, to which they are in a manner compelled by their poverty, they having but little to subsist upon but the offerings of the people, which frequently are no more than two or three handfuls of rice, a little betel, or some such trivial present. They dwell in mean houses near the temples, in which they offer up the prayers of the people, who bring them their petitions in writing. These the priest reads aloud before the idol, and afterwards burns them in the incense pot, the petitioner lying all the while prostrate upon the ground.

People of distinction seldom attend the pagodas; but chuse some open court about their own houses, where they offer up their prayers, one of their attendants reading the petition instead of a priest, while the master lies prostrate on the earth. This paper contains an account of all the blessings he has received, as health, riches, honour, the favour of the prince, and if he be old, long life, concluding with a prayer for the continuance and increase of these blessings. The reader having finished, sets fire to the paper, with burning rushes that stand lighted in an incense pot, and then throws three or four small parcels of gilt paper into the fire, which are consumed with it. As there are a great quantity of provisions dressed upon these occasions, the master no sooner rises than he orders his servants to eat, and make their hearts merry; for these people seldom perform any act of worship, without either giving the poor, or their attendants reason to bless them: their devotions being always attended with acts of charity and benevolence.

They annually observe two public feasts, the chief of which is at the beginning of their new year, which commences at the first new moon after the middle of January, when they spend ten or twelve days in rejoicing. There is during this time a cessation from all business; people

put on their best cloaths, and spend their time in drinking, gaming, and other diversions, and the common people, on these occasions get extremely drunk.

The other great festival is after their having brought in their first harvest. The first and fifteenth day of every moon are likewise holidays, in which they perform their devotions with extraordinary zeal. At these times they bring meat and drink to the sepulchres of their deceased friends, and after they are gone, the bonzes regale themselves with it. Their great men and civil magistrates also solemnize their birth-days, when they are complimented by all their friends and relations. At every entertainment a comedy is acted, and in these they are said to excel other nations. They are usually exhibited in the night-time, and last from sun-set to sun-rise: but their playing does not hinder the audience from eating and drinking; for they are generally as intent upon the feast, as upon the play that is acting.

The people are fond of astrology, and on every occasion consult the pretenders to that art. They are strict observers of times and seasons, of lucky and unlucky days, and as they give names to every hour in the day, as the horse, the bear, the tyger, &c. the beast which gives name to the hour in which a person is born is always avoided, from the apprehension that this beast will some time prove fatal to him.

A man's meeting a woman when he first goes out in a morning, is esteemed ominous, and on such an occasion they return home, and will not stir out for several hours.

SECT. VII.

A concise History of Tonquin, the extraordinary Form of its Government; the Ceremonies observed at the Funeral, and Coronation of the Bouas; the Power of the Choua; the Forces of the Kingdom; and of the Magistrates, Laws, and Punishments.

TONQUIN was formerly subject to the vast empire of China, when a famous rebber called Din, put himself at the head of a body of men of his own profession, whom he inspired with the resolution of taking up arms, and throwing off the yoke of servitude. He succeeded, and those whom he had engaged in the revolt, out of gratitude, placed him upon the throne. The happiness which the Tonquinese flattered themselves they had acquired by their independence, became to them a source of miseries and cruel wars, still more pernicious than their ancient subjection to the Chinese emperors. For seven centuries after their revolt, they were almost continually in arms one against another, in support of the different factions, which ambition and jealousy raised up among them; and the families on the throne were six times changed.

The last civil war introduced a new and very extraordinary form of government. Cochin China had, for some time, been subject to the king of Tonquin, who used to create a general with an almost unlimited power in each kingdom; but at length the general, who commanded the forces in Cochin-China, prompted by ambition, and perhaps also incited by resentment, threw off his allegiance, and made himself king; when the general of Tonquin, equally ambitious, observing his success, followed his example, and seized all the revenues of the kingdom: but being less desirous of the title of sovereign than of real power and real authority, he left the king the external splendor of a monarch, on condition that he should have the absolute command of the army, with the greatest part of the revenues of the kingdom, and that their descendants should succeed to the same privileges.

By virtue of this agreement there are two sorts of kings; he who receives the honours of royalty is called boua, and the choua has all its advantages. The boua is a kind of prisoner of state in his own palace, where he is allowed to indulge himself in luxurious indolence, and to take his diversions with his women and children. He is almost every day taken up in giving audience to his subjects, hearing their complaints, and determining their private differences. At certain times he receives the homage of the great officers, and is honoured with the acclamations of the people, who are so devoted to him as to pray for

for his prosperity, imagining that nothing can be of worse consequence to them than his dying without issue. The choua himself pays him the most profound respect before the people, declaring, that he has assumed the administration of the government, only to ease him of the trouble, that he may enjoy his pleasure without interruption or restraint. He is also addressed by the foreign ambassadors, as if he was still vested with sovereign power. But except these shadows of royalty, which he only receives on certain occasions, he has little reason to think himself a king; for he has few attendants, and none but those who are chosen by the choua.

The princes his sons partake of his servitude. They never leave the palace above four times a year, and that only six days each time, and they are besides attended by officers appointed by the choua. In the first of these six days of liberty they visit the temples; in the two following they take the diversion of hunting; and during the three last, they sail upon the river in galleys magnificently adorned. The right of primogeniture does not regulate the succession to the crown; the will of the father decides it in favour of him whom he most loves or esteems. As soon as he is declared, the choua, followed by his principal officers, the counsellors of state and the eunuchs, do him homage, and take an oath to place him on the throne after his father's decease.

It would be tedious were we fully to describe the pomp and magnificence of the ceremonies observed at his funeral. During the sixty five days following his death, he is served as if still alive, and provisions are distributed amongst the bonzes, and the poor. The whole nation puts on mourning, and every one wears it a longer or a shorter time according to his rank: the civil and military officers, for three years; the king's household, nine months; the nobility, six; and the people three. These three years are times of sadness, during which no rejoicings are allowed, except at the coronation of the succeeding prince. The custom is to carry the body of the deceased king into the desarts lying beyond Bodego. It is two day's journey from Cachao, the capital of the kingdom, to that city: but as the king and all the court go thither on foot, it takes up fifteen or sixteen days. All the road is covered with stuff of a violet colour, and at the distance of every quarter of a league there are places for refreshment. The choua takes care that there shall be lodgings for every night. In the midst of an immense and magnificent retinue of officers, elephants, and horses, is the chariot which carries the boua's coffin, drawn by six harts, trained for that purpose. After the corpse comes to Bodego, it is put into a galley, and attended only by the six principal eunuchs of the court, who enter it in a remote place, after having obliged themselves by oath never to reveal it. This secrecy is perhaps an article of their religion, or a precaution to prevent the treasures buried with him from being carried off, and which they imagine he may have occasion for in the other world. 'Tis said, that the princes and princesses give orders for their being buried near him, from a principle of gratitude, that in the other world they may continue to render him their services.

After these funeral ceremonies are over comes on the coronation of the new boua, which diffuses pleasures and diversions over the city of Cachao and the surrounding country. He is carried upon an elephant into the great court of the palace, which is covered with rich tapestry in form of a tent, where he receives the oath of fidelity from the great men of the kingdom, to whom he makes a present of several pieces of gold, worth about a hundred pistoles, and small bars of silver. Afterwards a large camp is erected in the midst of a vast plain. The king goes thither, with all the officers of his household, and a great part of the army, and there receives the oaths of the deputies of his kingdom and of his people. One half of the month passes away in rejoicings, every day is remarkable for the diversity of festivals, and the generosity of the prince; even the darkness of the night is not unemployed, for then are furnished new amusements by letting off continual fire-works, which are said to be infinitely finer and more curious than those we have in Europe.

These are the honours that chiefly distinguish the boua, who, during his reign, has not even a guard; while the

choua has his guards of horse and foot, and two or three hundred elephants, with an army of thirty thousand men quartered in and about the city of Cachao, and seventy or eighty thousand in other parts of the kingdom. These are chiefly foot, armed with match-locks and broad-swords.

The soldiers are taught to make their own gun powder themselves, in small hand-mills given them for that purpose; but they are ignorant of the art of corning it. Every soldier has a cartouch-box, in which are little hollow canes filled with powder, each holding a charge; and, it is said, that no people will load and fire quicker. Their arms are kept very bright, and in bad weather are covered with lathered cane.

Shooting matches are frequently appointed to make the soldiers good marksmen, and every one is rewarded according to his skill: he that shoots the widest from the mark is obliged to do double duty the next time he mounts the guard.

Most of the forces are kept on the frontiers of Cochinchina, the natives of which are almost their only enemies; and between the out guards of each kingdom there happen frequent skirmishes: but they very seldom come to a general engagement.

The troops can never take the field but in the dry season; for during the rains there is no marching or encamping. When the army marches, the generals and principal officers are mounted in little wooden apartments fixed on the backs of the elephants. They take no field-pieces with them, but some long guns that are about six or seven feet in the barrel; these, when they fire them, are rested upon crutches, and used to clear a pass, or to fire across the rivers. The soldiers take little baggage with them, and seem prepared rather for slight skirmishes, than a pitched battle.

The naval forces of the kingdom are very inconsiderable, they only consisting of narrow galleys sixty or seventy feet long: the head and stern are raised ten or twelve feet above the water, but the middle is not above two feet from it. The captain sits in the stern, which is painted and gilt; and the soldiers who row these vessels have a covering over them, to preserve them from the rain: they push their oars from them, and in the same instant they all plunge them into the water, there being a person who keeps time and gives the word, and the rowers answer in a hoarse voice. These vessels do not draw above two feet and a half water, and are of no service at sea, except in very calm weather.

The soldiers are also employed both upon the rivers and the roads to prevent the running of goods; they likewise keep watch in the towns and villages, particularly at Cachao: while they are on the watch they have only long staves, but they are very insolent and troublesome to those who pass by them; and it is in vain to complain of their ill usage, for their officers, to whom alone they are accountable, are not very ready to receive complaints against them: however, for a little money a man may pass their watch pretty quietly in the night.

None are capable of being preferred to any offices or posts in the government, unless they have taken their degrees, and gone through a course of study, as in China; their manner of taking their degrees, and their examinations, are also performed in much the same manner.

Yet most of their magistrates are eunuchs. Every governor is absolute in his province; and they are said to be exceeding covetous and imperious. At the death of an officer who is an eunuch, all his wealth falls to the government, on which account little notice is taken of their extortions. To the oppression and injustice of these officers is imputed the poverty and want of trade that is extremely conspicuous in the country.

An oath of fidelity is once a year administered to the subjects of every province, and upon this occasion every one drinks a cup of the blood of some fowl mixed with arrack, which is esteemed the most solemn oath by which they can bind themselves.

Here are no courts of justice, but any magistrate may cause an offender to be brought before him, and inflict such punishments upon him as is allowed by the laws of the country; but there is no formal trial, and consequently the innocent

innocent must sometimes suffer for the guilty ; nor is any time allowed for an appeal, sentence being immediately executed.

The usual punishment for murder and other capital crimes is beheading, which is generally performed before the offender's own door, or where the fact was committed : the criminal is seated upon the ground, with his legs stretched out, and the executioner, with a back-sword, strikes off his head at a blow.

Theft is not punished with death, but with cutting off a part or a whole member, according to the nature of the offence ; sometimes one joint of a finger, and sometimes the whole finger ; and for greater crimes the whole hand.

For some other offences criminals are loaded with iron chains and great wooden clogs ; and sometimes, as in China, they have large heavy boards made like a pillory, and hung about their necks for a month together ; but people are more commonly punished by receiving a number of strokes with a split bamboo. A person, after having suffered any of these punishments, is considered as infamous.

Debtors are frequently condemned to become prisoners to their creditors, and to work for them till their debts are paid ; during which time they live on rice and water, and undergo such other hardships as the creditor chuses to inflict.

S E C T. VIII.

Of their Trades, Manufactures, and Commerce.

THE Tonquinese are, in general, pretty good mechanics, and have many kinds of working trades amongst them, as painters, bell founders, potters, weavers, taylor, turners, carpenters, smiths, and paper-makers. One sort of their paper is made of silk, and the other of the bark of a tree, which is pounded in large troughs with wooden pestles. Money-changing, which is a great profession here, is managed by the women, who are very dexterous at it ; and, 'tis said, will raise the price of their cash with as much art as our stock-brokers do their stocks.

The Tonquinese make great quantities of stuffs from silk of their own produce, as foolies, pelongs, hawkins, peniafcoes, and gawz : the pelongs and gawz are some plain and others flowered. Besides these they make several other sorts, but these are chiefly bought up by the English and Dutch.

But though Tonquin abounds in silk, they seldom apply themselves to weaving it till the ships arrive ; for the people are kept so miserably poor by the great lords, to whom the lands belong, and whose vassals they are, that they have not even money enough to purchase materials ; and therefore foreign merchants are frequently obliged to advance it for them, and to wait several months till their goods are made. But the Dutch traders remedy this inconvenience by contracting a kind of temporary marriage with the women of the country, whom they make their factors to buy up silk and other materials at the dead time of the year, and employ the poor people when work is cheapest ; and, by this means, they have their goods ready when the ships arrive. Many of the Dutch, it is said, have raised good estates by these female factors, who are faithful to them, and the women also enrich themselves ; and when the Dutch husbands have left trading thither, have married the greatest lords.

Lackered-ware is another great manufacture of this kingdom, that of Tonquin being esteemed the best in the world next to that of Japan. The cabinets which are lackered there are made of pine-tree ; however their cabinet-makers are but indifferent artists.

The Tonquinese make great quantities of a coarse kind of earthen-ware of a grey colour, which is exported to several parts of India. From hence also is brought rhubarb, musk, turpentine, and several other drugs ; but these they are said to have from China. They have also lignum-aloes, and a dying wood not much unlike Campeachy logwood, but not so large.

They make no long voyages, nor do they export any merchandize in their own bottoms, except fish and rice to some of the neighbouring countries ; most of the trade is carried on by foreign shipping, and indeed they have few vessels that will bear the sea : those they use are chiefly fishing boats, or a set of long galleys, only fit for their rivers or the coasts in fair weather ; and as they have a very large sea coast, and many fine rivers well stocked with fish, their fishery employs a multitude of hands, and many of them live with their whole families upon the water.

The goods imported into Tonquin are English broad-cloth, lead, sulphur, salt-petre, great guns, pepper, and other spices. It does not appear they have any coin of their own, but they make use of foreign coins, particularly Spanish reals ; they also make payments with little pieces of silver, which pass by weight, and therefore have always their scales about them.

C H A P. XVII.

Of the Kingdom of L A O, or L A O S.

S E C T. I.

The Situation and Produce of the Country, with the Manners and Customs of the Inhabitants.

LAOS is bounded on the north by part of China, and on the west is divided by high mountains from the kingdoms of Siam and Ava, and by another chain on the east from Tonquin and Cochinchina. It extends from about the fifteenth to the twenty-second degree thirty minutes north latitude ; and some say that it is not above fifty miles broad from east to west. At the foot of the above mountains are forests of lofty trees that seem to have been planted as a rampart against the great torrents of water which in the rainy season rush with fury from the mountains, and to which alone is owing the harvest in a country that would otherwise be burnt up with heat.

This country produces a great quantity of benjoin, of a better kind than is found in any other country of the East :

the selling it to strangers is prohibited ; but for what reason is not known. Lacque is also found here, it is used in making Spanish-wax, and is a kind of earth that lies about the ant-hills in some forests. There is no country where more ivory is to be had ; elephants being so numerous, that the inhabitants have thence taken their name ; for it is said, that the word Langians signifies a thousand elephants. There are great herds of buffaloes, hogs, and wild cattle of several sorts. The fields abound with rice, and the rivers with fish of an extraordinary size. The country also produces a great variety of flowers, with plenty of cotton, honey, and wax ; and the inhabitants carry on a great trade in musk and amber. They have likewise mines of iron, lead, and tin ; and in the rivers are found gold-dust.

The natives, who are called Langians, are very tractable and good natured, faithful and honest. They are well shaped, robust, inclining to fat, and of an olive complexion ; but somewhat fairer than their neighbours. Their

Their principal food is rice, buffaloes flesh, and pulse of several sorts. They seldom eat cow-beef or fowls; and when any of the latter are wanted, they knock them on the head with a stick, thinking it the greatest crime to shed their blood while they are living, and they roast them without plucking their feathers. They apply themselves only to agriculture and fishing, yet it is very extraordinary to hear of a robbery or murder among them, which whenever it happens, and the criminal cannot be found, the neighbours are obliged to make satisfaction to the family of the sufferer. Fornication is permitted to the laity, but never to the talapoins, or priests; but an adulteress loses her liberty for ever, and becomes the slave of her husband. They allow polygamy, but the first wife has the pre-eminence. When they marry, both the bridegroom and bride promise before a couple that has been long married, that they will behave well to each other till death, and yet they frequently part on very trifling occasions. While the women lie in all the relations repair to her husband's house, and divert themselves with dancing and other pastimes. They have another festival which lasts a month at the decease of their kindred, whose funerals they celebrate with great splendor; and the talapoins who are invited sing certain songs, which they pretend puts the soul into the right way to heaven. When the month is expired they burn the corps, and carry the ashes to a pagoda; these structures are encompassed by stately tombs, upon which the rich expend very considerable sums.

S E C T. II.

Of the Government of Laos, the Splendor of the Court, and a concise Description of the Capital of that Kingdom; and of the Religion of the Langians.

THE sovereign is absolute and independant; for he disposes of all honours and employments, and has the property of all estates, so that no family can enjoy them by virtue of any testamentary bequests: and he leaves nothing to orphans but the moveable goods, so that no other man in the country can properly call a foot of land his own.

In order to impress on the minds of his subjects a high veneration for his person, he appears in public but twice in a year, when he shews himself three days each time. His ears, by being bored in his infancy, are so distended by the weight of his ear-rings, that they reach down to his shoulders, which is the characteristic of his pre-eminence above his subjects: who also bore their ears, but do not stretch them to such an immoderate length. He wears, instead of a crown, a fillet of gold round his head; and when he appears in public the people bring a number of elephants and wild beasts, with wrestlers and gladiators, into a large field, or spacious area, to divert him with their tricks and with their combats.

But the court appears in its greatest splendor when he goes with his gravees to make a present to some idol temple. The officers of state begin their cavalcade with bands of music playing before them; but the king makes the most splendid figure, he being mounted on one of the tallest and most beautiful elephants, which is adorned with

embroidered trappings that hang down to the ground; and the monarch, upon this occasion, is so loaded with precious stones, that he may be said to wear the wealth of a kingdom. His numerous followers are all richly dressed, and being mounted on fine horses ride in great order, with carbines that glitter with precious stones. The women, who are not permitted to go into the streets on that day, generally look out of the windows, and scatter scented waters both on the king and his present, which is carried on cattle richly decorated with trappings. The talapoins come out of their convent to meet the king, and attend him; while he, as the representative of both sexes, sacrifices to the idol.

The great officers of the kingdom are seven viceroys, who govern its seven provinces; the principal of these, who is called the viceroy general, eases the king in his burthen of government; and, upon his decease, summons the states, and disposes of every thing till his successor is placed on the throne. These seven viceroys constantly attend the king as companions and counsellors, and depute their lieutenants to discharge their office in the several provinces. In every province is a militia of horse and foot, whose officers are dependant on the viceroy, and the forces are subvided by the revenue of each.

The different rank of the courtiers are distinguished by gold and silver boxes of betel, of various forms and sizes, that are carried by the pages who attend their masters to all the public assemblies. The viceroy-general in all public processions rides on an elephant richly accoutred; the other viceroys have chairs lined with cloth of gold, and are accompanied by servants in rich liveries. All the other officers go on foot, without shewing their boxes.

As the king is absolute, and the people have little foreign trade, they have few laws, but every family is under vassalage to one who is their head and superior; by which means the king can assemble a numerous army in a very short time, by only giving notice to the chiefs: but if one of these chiefs is found guilty of any remarkable crime, all his kindred are deprived of their rights and prerogatives, and obliged to engage in the mean employment of serving the king's elephants. Crimes are here severely punished, especially breaches of the peace; and in all civil affairs, the judge has a right to condemn the parties without appeal.

The capital of Laos is called Leng, or Langione, which is situated on the banks of the river Mecon, in one hundred degrees fifteen minutes east longitude, and in latitude twenty-one degrees forty-five minutes. Marini says, that the palace, which is of great extent, has many of the apartments adorned with basso relievos richly gilt; that the great men's houses are lofty, beautiful, and built with timber, but those of the common people are meer huts; and that none but the talapoins have leave to build their houses of brick and stone.

The talapoins are under the class of noviciates till they are twenty-three years of age, when they pass their examination, and are incorporated. Some of the Langians believe that the souls of the wicked, on leaving the body, are annihilated; but that those of the virtuous assume an ethereal body, as clear as the light; and, after passing through sixteen heavens, and enjoying the pleasures of all, return to earth, and again inhabit the human body.

C H A P. XVIII.

OF COCHIN-CHINA, and CAMBODIA.

S E C T. I.

The Situation and Extent of Cochin-China; its Climate, Vegetables, and Animals; with a particular Account of the edible Birds-Nests.

COCHIN-CHINA, or West China as the name imports, was thus called by the Portuguese to distinguish it from Cochin on the Malabar coast; and if we include Chiampa, which is a province of Cochin-China, or at least tributary to it, extends from eleven degrees thirty minutes north latitude to sixteen degrees ten minutes, and is about three hundred miles in length from north to south, and one hundred and fifty where broadest from east to west. It is bounded on the north by Tonquin, on the east by the sea of China, on the south by the Indian ocean, and by the kingdom of Cambodia and the mountains of the Kemois. Captain Hamilton observes, that it extends along the coast of the sea seven hundred miles from the river of Cambodia to that of Quambin.

This kingdom, which is called by the natives Anam, or the West Country, is said to be more temperate than Tonquin, from its lying more open to the sea, and being refreshed by the sea breezes. However, both countries lie upon a flat, and are annually overflowed about the same time: the seasons are consequently the same, and the lands equally fruitful in rice, which requires no other manure but the mud left by the waters, which renders it so fertile, that they have three harvests in a year. This inundation happens once a fortnight for three days at a time, during September, October, and November; and not only gives fertility to the soil, but drowns vast numbers of the rats with which the rice fields are pestered. At this time they have their greatest fairs and markets, on account of the ease with which they can transport goods from one place to another by their boats, in which they also take up the drowned cattle, which serves them for food.

Cochin-China is divided into the following five provinces, Renan, Pulocambi, Quamgum, Cachiam, and Sinuva; this last joins to Tonquin, and in it the king keeps his court; but travellers neither give any account of the situation of the other provinces, nor describe any of their towns.

The country produces sugar-canes, and the same fruits as are found in Tonquin all the year round, particularly oranges, durions, ananas, bananas, melons, and several others; but they have no grapes, nor scarcely any other European fruits. They have, however, vast woods of mulberry trees, and others that afford excellent timber, particularly iron-wood of several sorts: they have also the aquila-tree, the wood of which has a very fragrant smell and grows upon the Kemois mountains. The wood of the old trees has the finest scent, this is called colamba, and is reserved for the king's use. It is supposed to be the same with lignum-aloes, and is highly valued in China and Japan, where a block of it is used for a pillow; and among the Indian nations that burn their dead, great quantities of it are consumed in the funeral piles.

The same animals are to be found here as in Tonquin, especially rhinoceroses and elephants of an extraordinary size, and the country abounds with wild and tame cattle, fowl, and fish.

In treating of the produce of this country it will not be improper to give here a description of the edible bird's-nests, which have already been so often mentioned in this work, and which are admired as an extraordinary dainty over all the Indies. These nests are chiefly found in Cochin China: they are built by a small bird like a swallow, in the rocks upon the sea coasts, and are composed of the sea-froth, and a juice from the bird's stomach, which hardens with the sun, and is almost transparent: this being softened with water is pulled in pieces, and by be-

ing put into soup, is esteemed extremely nourishing, and is by many people accounted very delicious.

S E C T. II.

Of the Persons, Dress, Manners, Customs, Buildings, Religion, and Trade of the Cochin-Chinese.

THE natives resemble the Chinese in their stature, complexion, and features; but all of them wear their hair at its full length, like the Tonquinese.

Their dress consists of silk gowns or vests of various colours one upon another; the men swathe their legs and thighs with silk instead of breeches, and they have slippers or sandals, which, when they visit, they leave at the door, where a pan of water is always set to wash their feet. Their dress is, in short, the most modest of that of any people in the Indies. The women wear a waistcoat close to their bodies, and several petticoats, with a veil over all. The coat next their bodies trails on the ground, and the rest are shorter than each other by half a span. Both sexes wear fans, and never uncover their heads by way of salutation. The men of learning wear above the rest of their cloaths a gown of black damask; they have a stole about their necks, a blue silk handkerchief round their arms, and high caps resembling mitres. But the other persons of both sexes wear broad caps embroidered with silk and gold, and never cut their beards and nails any more than their hair, because nature, they imagine, designed them for ornament; but the mechanics, and all persons concerned in manual labour, are obliged to pare their nails for the sake of convenience.

Their food, and manner of eating and drinking, is the same as the Tonquinese, but they reckon it a sin to drink milk, because it is the food of the young. They eat at little round tables, adorned with silver and gold, according to the quality of the owner, and their dishes are placed upon them in frames made of sugar-canes.

They are strong, active, and naturally more courteous and polite than their neighbours, and though they are said to be better soldiers, have a great command of their passions. They are very liberal and charitable, yet they are ready to ask for any thing that pleases them, and to take a denial as an affront.

Their houses, which are of wood, and two stories high, are well carved on the inside, and erected upon lofty pillars with boards betwixt them, which they can remove at pleasure, to leave a free passage for the water during the time of the inundation, when they retire into the upper apartments, and have a communication with one another by boats. In these houses are three degrees of seats; the first is a mat on the floor, upon which the common people sit cross-legged; the second is a low stool covered with a fine mat for those in genteel circumstances, and the other is a kind of couch raised against the wall, two or three feet above the floor, for the nobility and priests.

Their physicians, like those of China, are skilful in the cure of diseases. They feel the patient's pulse, and immediately pronounce whether he be curable or not. If the latter, they give him nothing; but if the former, they bargain with the patient to perform the cure in such a time, or else to have nothing for their attendance. The surgeons are also said to be masters of some extraordinary secrets.

Their language has some resemblance to that of the Chinese; and they have a learned language different from that commonly spoken.

As to their religion, they believe the immortality of the soul, and eternal rewards and punishments, and are firmly persuaded that the spirit passing from one body to another more noble, is a part of its future reward. They make entertainments for the deceased, who they imagine feed on the immaterial substance of the provisions, which they

they distinguish from the accidents of quantity and quality. They worship the souls of men reputed holy, and place their images among their idols in the temples. Their high altar is kept empty, with a dark vacant space behind for the supreme God, whose chief attribute is according to them invisibility, and they only pray to the rest to intercede with him. Borri observes, that when he was here, one of their governors died, and as he lay on his death-bed, a multitude of armed men made thrusts in the air with their scymeters, threw darts, and fired muskets in the palace, and that men on each side continually beat the air about his mouth with their scymeters, to hinder the evil spirits from hurting his departing soul. Then finding that his death was caused by the fall of a beam in his palace, they burnt the whole fabric; for the Cochin-Chinese always burn the supposed cause of death, whether a house, a man, or beast. The governor's body was attended to its interment by a multitude of people dancing, who had built a new palace far more noble than the old one, and as many galleys as he used to keep, which run on wheels; they also prepared wooden elephants, horses, and other moveables, and erected a kind of temple in the midst of the palace, in which was an altar whereon they placed the coffin. No governor was appointed during the space of three years, because they imagined the soul of the deceased ruled till that time was expired.

Several authors have given a very romantic description of these people, particularly the Abbé Choisi, who attended the French Ambassador to Siam; and in his journal has a long and florid description of their customs. "Nothing," says he, "can be finer than the galleys of the Cochin-Chinese. All without is black varnish, and within red, shining like a mirror. Every one of them has sixty oars, all gilt. The rowers, who are also soldiers, have at their feet a musket, a poniard, a bow and quiver. They are forbid, on pain of death, to utter so much as a word. They constantly keep their eyes on the commander, who delivers his orders by the motion of a wand, and every thing is so nicely adjusted, that a master of music, when he beats time, does not make himself better understood by all his musicians.—The sailors commonly wear only drawers of white silk, and a hair cap: but when they prepare for battle, they put on their heads a small gilt head-piece, and on their body a fine close coat. They have the right arm shoulder and side entirely naked." Were these close coats then glewed on? If not, how were they fastened? He proceeds, "The land army, consists of thirty thousand men: the king's household of nine thousand, and the first princes of five.—The guards of the king and prince are clothed in velvet, and have arms of gold and silver: the officers are more or less magnificent, according to their degrees; and on the day of battle, or a review, the common soldiers are dressed in an uniform of green, red, or yellow sattin." Few romances are filled with such marvellous and extravagant descriptions; but in this stile several other of the French authors have written, who have visited these countries, and their absurdities render even what is most probable, when asserted by them, suspicious. These countries are, indeed, but little known by any Europeans; nor have we materials from authors of acknowledged veracity, sufficient to describe them in a proper and judicious manner.

We may, however, add from captain Hamilton, that their laws are severe, and a painful death is not only inflicted on those guilty of treason, but also on their relations within the bounds of consanguinity. Their cities and towns are divided into wards, and at the ends of each street are railed gates, placed to confine each ward within its own limits. These gates are locked every night, so that the people of different wards can have no communication.

As to their trade they give little encouragement for strangers to traffic with them; but as their country abounds in gold, raw silk, and drugs, they carry them to Cambodia, and dispose of them there, except what they annually send to Canton in China, and some of their junks trade to Johore and Cambodia.

SECT. III.

Of CAMBODIA, or CAMBOYA.

Its Situation, Extent, and Produce.

THE kingdom of Cambodia is situated to the east of Cochin-China and Chiampa, and is bounded on the north by the kingdom of Laos, and the Kemois mountains; on the south by the Indian Ocean, and on the west by the kingdom and gulph of Siam, it extending from the eighth degree of north latitude to about the fifteenth. It makes near four hundred miles in its greatest length, and about two hundred and ten where broadest; but it becomes very narrow towards the north.

The west part of this country is mountainous and desert, but in the middle it lies low, and is watered by the river Mekan, which runs through its whole extent, and beginning to swell on the first of June, rises ten or twelve feet, and in July and August overflows the neighbouring lands. This river rises in Tibet, and after running a course of fifteen hundred miles, falls by two mouths into the sea, forming an island: the most eastern of these streams is called the Cambodia river, and that to the west is named Ocbequane, or Bona de Carangera.

In this country are found amethysts, sapphires, corneli-ans, chrysolites, garnets, and cats-eyes, properly called acates, and milk and blood-stones. It also produces gold.

The country likewise abounds in rice, and other corn, cocoas, oranges, citrons, mangoes, and other Indian fruits. Here is also plenty of J pan wood, sandal wood, aquila wood, cambogia or gamboge, a yellow gum used in medicine, and in painting, and sold in rolls; flick-lac, lac for japanning; raw silk, and elephants teeth.

Captain Hamilton says, that flesh and fish are the only things to be bought without a permit from the king; and that these are so plentiful and cheap, that he purchased a bullock of between four and five hundred weight for a Spanish dollar, and that one hundred and forty pounds weight of rice may be bought for eight pence; but poultry are scarce, because the country being for the most part woody, the chickens as they grow up, betake themselves to the woods. In these woods grow certain trees with a thick bark, of so poisonous a nature, that the inhabitants, who go in search of wild elephants for the sake of their teeth, take with them a piece of iron with a sharp end, which they drive into the bark of this tree, and after it has stayed a short time, take it out, and put it into their gun charged with powder, and when they come within reach, shoot it into the elephant's body. The wounded beast immediately flies, while the men following, keep him in sight till he drops down dead. With the same poisoned slugs they also kill wild cows and buffaloes for the sake of their tongues. 'Tis said this subtle poison has a very surprising quality; for if the men are hungry or thirsty, as is often the case while they are hunting in the woods, they squeeze a few drops of it on a leaf, and by barely licking it, are instantly refreshed; but if the skin be broke, and the juice touch the part, it proves mortal without remedy.

The woods also abound with lions, tigers, wild boars, horses, and plenty of deer, all which every body are at liberty to catch, or to kill.

SECT. IV.

The Persons and Drefs of the Cambodians; and the different Manufactures of the Country. A concise Description of the City of Cambodia; with an Account of the Reception the King gave to the Supercargo sent to him by Captain Hamilton, and the Manner in which that Kingdom became tributary to Cochin-China.

THE Cambodians are of a brown complexion; they have long hair, thin beards, and are very well shaped; their women may be esteemed handsome; but are not distinguished by their modesty. Both sexes dress their hair.

The

The men wear a vest; but nothing on their heads and feet. The women have a petticoat that reaches below their ankles, and a jacket that fits close to their bodies and arms.

The people are ingenious, and have manufactures of several sorts of cotton, muslins, buckrams, calicoes, white and printed dainties, and other stuffs. They also adorn their rooms with carpets, and weave a sort for the common people, that resembles the Scots plaids. They likewise weave silk, and both weave and work with the needle rich hangings, coverings for the low chairs used by the women of quality, and for the Indian litters and palanquins, the wood work of which is adorned with ivory and tortoiseshell. They make beads, bracelets, necklaces, and other ornaments of crystal, which is found in the mountains. They have likewise indigo, which they prepare and sell to the neighbouring countries.

Cambodia, the capital, is situated on the river Mecon, about fifty or sixty leagues from Ponteamas, and is the only city in the kingdom worthy of notice. The prince resides in a mean palace, surrounded with a palisade that resembles a partition-wall; but is defended by a great number of Chinese cannon, and by some other pieces of artillery that were saved from the wreck of two Dutch vessels thrown upon the coast. There is a temple here of a very particular structure, whose beauty is much commended. It is supported by wooden pillars varnished with black, and adorned with gilded foliages and reliefs, and the pavement is covered with mats. The priests who serve in it hold the first rank in the state.

There are about two hundred Topasses or Indian Portuguese settled and married in Cambodia, some of whom have pretty good posts in the government: but they have no priest, nor will any venture to go among them; for in the year 1710, says Mr Hamilton, a poor capuchin going there to officiate, and finding that one of the richest of his congregation had two wives, he, by virtue of his sacerdotal authority, ordered him to put one of them away; but his parishioner disregarding this injunction, the priest made use of the weapon of excommunication against him, at which the other was so exasperated that he knocked out the priest's brains. Since that time they have wrote for more ghostly fathers, but none will come amongst them.

When captain Hamilton arrived at Ponteamas, which is situated on a pretty deep, but narrow river, an officer came on board, who could speak a little Portuguese, and bringing him a present of refreshments, advised him to send to the king, in order to give him an account of his arrival, and to let him know that he intended, by his permission, to trade with his subjects. This he did, and received for answer, he might send a person with goods, that the king and his merchants might see them, and two Portuguese were sent him for interpreters, one to stay with him on board his ship, and the other to accompany the person he should send to court. On their arrival he sent his second supercargo with twenty-five men well armed with fuzees and bayonets, with two small bales of patterns, and presents for the king, ordering him to let him hear from him once a week.

The supercargo no sooner arrived at the city than a large house was given for the accommodation of himself and his retinue; plenty of provisions was sent him, and he was visited by many people of distinction; but ten days passed before he could see his majesty, who, at last, received him in great state, seated on a throne like a pulpit: his face was veiled below his eyes, and after many gracious speeches, he gave him leave to trade.

Captain Hamilton, having staid about three weeks without hearing any news of his supercargo, began to be very uneasy, and at last resolved to depart by a certain day, and leave his people, if they were alive and at liberty, to follow him to Malacca; the goods he had sent up with them being sufficient to enable them to hire a vessel to carry them thither. He told his resolution to the interpreter, and informed him that he should be obliged to carry him and some more of the king's subjects with him as hostages for the civil treatment of his people at Cambodia. The interpreter, surprised at this resolution, sent a person in haste to the city, to give an account of his impatience and design, who returned in fourteen days; about two days before the time the captain had fixed for his departure. He was accom-

panied by three Portuguese, who brought letters from the supercargo, to inform him that he had taken leave of the king, and was coming in all haste. Three days after the supercargo arrived with all his retinue, and a letter of compliment from the king to Mr. Hamilton in the Portuguese tongue, and one directed to the governor of Bombay, to invite the English to settle in his country, and to build factories or forts in any part of his dominions.

The reason why he was kept so long in suspense was the king's being unwilling to enter into any correspondence with him without the knowledge and consent of the king of Cochin-China; who at length consented to allow the English to trade both in Cambodia, and in his own dominions.

When the king is disposed to do a singular honour to a person, which he never does without a handsome present, he gives him two swords, which are to be constantly carried before him when he publicly goes abroad, one of which is the sword of state, and the other that of justice. All who meet him when these swords are borne before him, must give him place, and compliment him in a set form of words; but if he meets with another who has the same privilege, they compare the dates of their patents, and the first salutation must be paid to the senior patentee.

Whenever these persons go into the country they hold courts of justice both civil and criminal, and have the power of imposing fines, which are, however, paid into the king's treasury. In capital cases their sentence is law, and is followed by a speedy execution.

We shall now give a concise account of the manner in which Cambodia became tributary to Cochin-China. About the year 1716 the king of Siam threatening to invade Cambodia, the king, sensible of his being unable to oppose to powerful a prince, ordered those of his subjects who lived near the borders of Siam to remove towards the city of Cambodia, and to destroy whatever they could not bring with them. This was performed, and the country, for the space of fifty leagues, was rendered a mere desert. He then applied to the king of Cochin-China for assistance and protection, which he obtained, on condition that Cambodia should become tributary to that kingdom; fifteen thousand men accordingly marched by land to his assistance, while three thousand galleys, well manned, were fitted out for the sea: yet the Siamese army amounted to above double the number of the united forces of Cambodia and Cochin-China, and their fleet was above four times as numerous. But the Siamese, in their march through Cambodia, finding the country desolate, were soon in such distress, for want of provisions, that they were obliged to kill their elephants and horses; and the soldiers feeding on their flesh, to which they had never been accustomed, the whole army was seized with a flux and fever, which in two months time carried off half those troops, and the rest were obliged to retreat back towards Siam; while the Cambodian army being constantly at their heels, harassed them in their march.

Mean while the Siamese navy steering to Ponteamas, the small galleys were sent to plunder and burn the town. This they accomplished, and above two hundred tons of elephants teeth were consumed in the flames. While this was performing the ships of burthen lay in the road above four miles from the town, when the Cochin-Chinese seizing this opportunity, attacked the large vessels, burning some, and forcing others on shore; while the galleys, detained by the ebb of tide, could not come down the river to their assistance. The Cochin-Chinese, having now fulfilled their engagement, retired; and the Siamese, fearing a famine in the fleet, returned with disgrace to Siam.

SECT. V.

Of PULO CONDORÉ.

The Situation of those Islands, with an Account of the Destruction of the English Fort on the largest of them; its Produce, and the Manners of the Inhabitants.

TH E R E are several islands that lie off the coast of Cambodia, among these are those of Pulo Condore, or the islands of Condore, which are situated in eight degrees

degrees forty minutes north latitude, and are twenty leagues south-by-east from the mouth of the river Cambodia. The largest, which is the only one of these islands that is inhabited, is between four and five leagues long, and three broad in the widest part. The next in size is about three miles long and half a mile over, and with the other forms a commodious harbour. The English settled on the largest of these islands in 1702; but having bargained with some Macassers, natives of the island of Celebes, to serve for soldiers and help to build the fort, and not discharging them at three years end according to their contract, but threatening them for letting two slaves escape out of their custody, they rose in the night, and murdered every Englishman they found in his bed, then set fire to the fort, in which nineteen Englishmen had been slain, among whom was Mr. Lloyd, the governor: eleven or twelve made their escape in a sloop to Malacca; and of sixteen who staid behind, with the hopes of saving the money in the fort, all were murdered by the Cochin-Chinese, except one or two who were taken prisoners, and afterwards suffered to escape: for in the island are two or three small villages, with whom the English had not been upon good terms, and therefore would not suffer the inhabitants to have any arms in their houses.

The cottages in these villages are raised several feet above the ground: they are built with bamboos, and thatched with long grass, which they cut by the sides of their brooks; but in these structures are neither doors nor windows, one side of them being left open both for the entrance of the people and of the light.

The inhabitants, who are of a swarthy complexion, go almost naked, except at certain ceremonies, when they are dressed, and some of them very neatly. As most of them are descended from the Cochin-Chinese, they affect

black teeth and long hair, which in some of them hangs down below their knees.

They have a little rice, some potatoes, and very good bananas. On the mountains grow fine trees, which afford timber for masts and other uses, particularly a large one called the damar-tree, which is about three or four feet in diameter; its leaves and bark resemble those of the chestnut, and the wood is very hard. From this tree they draw a kind of turpentine, by making a cavity in the trunk three or four feet above the ground. This matter is at first a liquid, and of the colour of the oil of nuts, though it afterwards turns whitish, has the consistence of butter, and a very agreeable smell. Of this they make flambeaux, which they burn in their rooms instead of candles. The island also produces mangoes, wild nutmegs, which resemble the true only in shape, and a fruit like grapes, which grow on large trees. Here is also found the cabbage-tree.

The animals found in this island are hogs, lizards, and guanoes: there are also parrots, parroquets, pigeons, and wild cocks and hens of about the size of a crow.

The inhabitants chiefly employ themselves in fishing; in making brine for salting little fish like anchovies, which abound in the sea; in drawing off turpentine from the above trees; and in catching turtle, of which they make oil, and sell it to Cochin-China. Dampier tells us, that when he was there the men brought their women on board and offered them to the sailors, which, as he observes, is very common in this and the neighbouring countries. As to their religion, he observed a small pagoda in the island, on one side of which was the image of an elephant above five feet high, and on the other the figure of a horse not quite so large. This temple was a low wooden building, thatched like the other houses.

OF S I A M.

S E C T. I.

The Name, Situation, Extent, Provinces, Rivers, and Seas of Siam. The Nature of the Soil, and the Minerals found in the Country.

THE Portuguese, and from them the rest of the Europeans, call this country Siam; but by the natives it is stiled the country of Tai, or of Freeman, tho' they have long lost their liberty. Thus the French, who were once free, were originally called Franks, from their bravely opposing all encroachments on their native freedom.

The opinions of geographers are extremely various with respect to the situation and extent of most of the inland countries of Asia and Africa, particularly of Siam Proper: for it is not exactly known in what part of the peninsula of Malacca it begins, nor how far it extends above that peninsula, the precise boundaries either of that or the neighbouring kingdoms not being determined by the few European travellers who have visited them. All we know, with respect to Siam, is the exact situation of its capital, which is of the same name. However, according to the opinion of the Sansons, the most southerly part of the kingdom is in about the eleventh degree of north latitude, and it is supposed to extend at least five hundred and fifty miles in length, and two hundred and fifty in breadth, though in some places it is not above fifty miles broad.

Siam Proper, by some called the Upper, to distinguish it from the Lower Siam, under which several authors include Laos, Cambodia, and Malacca, is bounded on the north by the kingdom of Pegu and Laos, on the east by Cambodia and Cochin-China, on the south by the kingdom of Malacca and the bay of Siam, and on the west by the ocean; and contains seven provinces, which receive their names from their respective capital cities, Profelouc,

Sanguelouc, Lacontai, Campengpet, Coconrepina, Pechebonne, and Pitchia.

The principal rivers of Siam are the Menan, the Mecon, and the Tenaferim: the first discharges itself into the gulph of Siam, in the fourteenth degree of north latitude; the second, having passed through Laos and Cambodia, falls into the Indian sea in the ninth degree of north latitude; and the last falls into the bay of Bengal, in the thirteenth degree of latitude, and forms an island called Merguy, which is one of the best harbours in India. The chief cities of Siam are situated near the sea-coast, or upon some of these rivers, for the mountainous part of the country is almost covered with woods, and that which is not, is parched up by the heat of the sun, and is less fit for tillage than the low lands, particularly for rice, the common food of the inhabitants.

As to the seasons, the winds blow from the south upon the coast of Siam in March, April, and May: in April the rains begin, and in June they continue almost without ceasing. In July, August, and September the winds blow from the west, and the rains continuing, the rivers overflow their banks nine or ten miles on each side, and for more than one hundred and fifty up the stream. At this time, and more particularly in July, the tides are so strong as to come up the river Menan as far as the city of Siam, which is situated sixty miles from its mouth; and sometimes as far as Louvo, which is fifty miles higher. The winds blow from the west and north in October, when the rain ceases. In November and December the winds blow dry from the north, and the waters being in a few days reduced to their ancient channels, the tides become so insensible, that the water is fresh at the mouth of the river. At Siam there is never more than one flood and one ebb in the space of twenty-four hours. In January the wind blows from the east, and in February from the east and south. When the wind is at east, the current sets

to the west; and, on the contrary, when the wind is at west, the currents run to the eastward.

As this country is situated near the tropic, it must certainly be very hot; but yet, as in other places between the tropics, when the sun is vertical and shines with a most intense heat, the inhabitants are so screened by the clouds, and the air so refreshed by a deluge of rain that overflows the plains which the people chiefly inhabit, that the heat is very supportable. Hard winters are not to be expected in a situation so near the equator; but there, as well as here, the coolest wind blows in December and January.

As the soil of Siam has been gradually formed by the clay and other earth washed down from the mountains, they have little stony ground, and there is scarce a flint to be found in the whole country. Loubiere observes, that it was antiently rich in mines, and the multitudes of cast-works, as well as the old pits that have been discovered, shew that formerly there were more wrought than at present; indeed the gold, with which their images and the roofs of their temples are covered, render it evident that they antiently found great quantities of that metal. But a king, who reigned towards the close of the last century, was unable to discover any vein of either gold or silver, that was worth the expence of working, though he employed several Europeans in the search, particularly a Spaniard who had been concerned in the mines of Mexico. After all their endeavours, they were only able to find some inconsiderable veins of copper, intermixed with a little gold and silver. But Mr. Vincent, a physician, shewed them a mine of crystal, one of antimony, and another of emery: he also found a gold mine, which he believed to be very rich; but did not discover it to the king. Several of the talapoins, and others, came secretly to him to learn how to purify and separate metals, bringing him specimens of very rich ore. The Siamese have, however, long wrought very plentiful mines of tin and lead.

As to precious stones, there are found diamonds, sapphires, and agates, in the mountains; but as the king's officers seize these for his majesty's use, the people have no encouragement to search for them. There are also loadstones in a mountain near the city of Louvo, and also in the island of Jonslam, which is situated in the Malacca coast, in the bay of Bengal.

S E C T. II.

Of the Method of Husbandry practised by the Siamese; and of the Trees, Plants, and Animals of Siam.

IN the plains the earth is rendered fertile by the mud which the river leaves behind; but all the higher grounds are dried up and burnt by the sun, soon after the rains are over: and though some of their lands are naturally fertile, yet they are so subject to droughts, and so ravaged by insects, that the natives are sometimes deprived of their harvest for several successive years; and these times of famine are generally succeeded by pestilential diseases.

The natives sometimes sow wheat upon the land which the inundation never reaches, and water it by little channels cut through the fields. They have annually two crops, but not on the same spot of ground.

They use oxen and buffaloes in plowing their ground, and guide them with a rope run through their nose. They use a plain plough without wheels, that has a share, and a staff to hold it by; in other respects, it is not much unlike our foot-ploughs, only instead of nails they fasten the pieces together with pins and thongs.

Instead of thrashing the rice, the cattle tread it out, and the people separate the dust and chaff by pouring it down by degrees from a high place, when the wind performs the office of winnowing it; but as the rice has still a hard thick skin, they beat it in a wooden mortar to get it off, and make it fit for boiling.

The Siamese prepare the land for tillage as soon as the earth is sufficiently moistened by the floods. They plant their rice before the waters rise to any considerable height, and as the waters rise slowly, the rice keeps pace with it, and the ear is always above the water. They reap their

corn when the water retires, and sometimes go in boats to cut it, while the waters are upon the ground. They also sow rice in several parts of the kingdom that are not overflowed, and this is thought better tasted, and will keep longer than the other; but they are forced to supply these fields constantly with water, while the rice is growing, from basins and ponds that lie above them.

Formerly the king of Siam annually plowed a piece of land like his neighbours of Tonquin and China; but this ceremony is at present performed by an officer in his majesty's room, when a great sacrifice is offered to Sommona Codom, whom they implore to be propitious to their labours.

In their gardens they have pulse and roots, but they are for the most part different from ours; they have also garlic, potatoes, and radishes; but no onions, turnips, carrots or parsnips, nor any lettuces, coleworts, or any of the herbs used in our sallads. They have cucumbers, which are very wholesome, and may be eaten freely without any inconvenience, and garlic in this hot country loses much of its rankness. After the time of the inundation, they cover their garden plants from the heat of the sun, as we do from the cold.

There are here none of the fruits known in Europe, except oranges, lemons, citrons, and pomegranates. The oranges of one kind or other continue all the year; but most other fruits have their season. They have bonanas, Indian figs, jaques, durions, mangoes, mangostans, tamarinds, ananas, and cocoa nuts: they also abound in sugar-canes and pepper. As great part of their food consists in the produce of their gardens, they extend for several leagues together upon the Menan, between Siam and Bancoek.

They have some of the flowers common in Europe, as the tuberose, gillyflower, and a few roses; but they are not so strong scented as in Europe. They have likewise some jessamines, amaranthuses, and tricolets, but no other European flowers, though they have some peculiar to the country, that are very beautiful and fragrant, but it is observable, that some of them smell only in the night-time, the heat of the day entirely destroying the scent.

As the hilly part of the country is almost entirely uncultivated, it is covered with woods, but the tree, or rather reed of greatest use in this country, is the bamboo, which grows chiefly in marshy soils, and like reeds and sedge, is found on the sides of ponds and rivers: it also resembles them when young, but grows to a prodigious size, and hardens so as to be applied to any use, though, when it is green and tender, the Siamese pickle it for sauce. It is hollow, and the shoots are separated by knots: but it has branches and thorns, which our reeds have not, and each root shooting out several stems, nothing is more difficult to pass than a forest of bambooes, especially as the wood is hard to cut, though nothing will more easily cleave: the Siamese are said to strike fire with it, and, like other canes, it has a sweet pith.

This country affords timber for building ships, and for masts, and their cordage is made of the husk that covers the cocoa-nut. They have likewise timber for houses and wainscoting, and a wood that will not cleave, called by the Europeans, woodmary, said to be fit for the ribs of ships. Cotton trees are in great plenty, and others, that yield capoc, a very fine cotton wool, but so short as to be unfit for spinning, and is therefore used in stuffing mattresses and pillows. From some of their trees they also extract oil, and there are others which yield lacker and gums. Cinnamon-trees are found here; but they are inferior to those of Ceylon.

They have elephants and a few horses, sheep and goats; but these last are not good eating any more than their oxen and buffaloes, which are chiefly used for tillage. Their hogs are small but fat, and the wholesomest flesh meat in the country. They have a few hares, and no rabbits. Deer are very plentiful, though great numbers are destroyed by wild beasts; and many of them are killed by the inhabitants only for their skins, which they sell to the Dutch, who carry them to Japan.

Ducks are plentiful, and extremely good; they have pigeons, and wild peacocks, grey partridges, turtle-doves that have a variety of gay plumage; excellent snipes, and

and abundance of wild fowl, which the natives will neither kill nor take; but it is said the Mahometans here have falcons, which they bring from Persia to fly at the game.

They have vultures, parrots, crows, sparrows, and many kinds of small birds, most of which are very beautiful, but have disagreeable notes, and there are several that imitate the human voice. The sparrows are so tame that they enter the houses, and pick up the insects. Vultures and crows also come into the houses, where they are fed by the people. Loubiere says they give the children, who die before they are three years old, to be devoured by these fowls; for in this country it is so far from being thought a curse to have their carcases eaten by birds of prey, that, next to burning, it is esteemed the most honourable method of disposing of the dead.

There are many snakes, lizards, scorpions, and millipedes, and their ants and gnats are very troublesome. These ants to avoid the inundation, make their nests, and lay up their stores on the tops of the trees. In the waters are a multitude of insects unknown to us, and they have a fine shining fly like a locust, that gives a considerable light in the dark.

SECT. III.

Of the Persons, Dress, Temper, and Food of the Siamese; their Ceremonies, and most remarkable Customs, particularly their Manner of Travelling.

THE Siamese are small of stature, but well proportioned; their complexions are swarthy: the faces of both the men and women are broad, and their foreheads, suddenly contracting, terminate in a point, as well as their chins. They have small black eyes, hollow jaws, large mouths, and thick pale lips. Their teeth are dyed black, their noses are short and round at the end, and they have large ears, which they think very beautiful. Their hair is thick and lank, and both sexes cut it so short, that it reaches no lower than their ears. The women make it stand up on their foreheads, and the men shave their beards.

People of distinction wear a piece of callicoe tied about their loins, that reaches down to their knees. The men bring up this cloth between their legs, and tuck it into their girdles, which gives it the appearance of a pair of breeches. They have also a muslin shirt without a collar, with wide sleeves, no wristbands, and the bosom open. In winter they wear a piece of stuff, or painted linen over their shoulders, like a mantle, and wind it about their arms.

The king of Siam is distinguished by wearing a vest of brocaded satin, with straight sleeves that reach down to the wrist, under such a shirt as we have just described, and it is unlawful for any subject to wear this dress, unless he receives it from the king. They wear slippers with picked toes turned up, but no stockings. The king sometimes presents a military vest to the generals: this is buttoned before, and reaches to the knees; but the sleeves are wide, and come no lower than the elbows. All the retinue of the king, either in war or in hunting, are clothed in red. The king wears a cap in the form of a sugar-loaf, encompassed by a coronet or circle of precious stones, and those of his officers have a circle of gold, silver, or of vermilion gilt, to distinguish their quality; and these caps are fastened with a stay under the chin: they are only worn when they are in the king's presence, or when they preside in courts of justice, and on other extraordinary occasions. They have also hats for travelling; but in general few people cover their heads, notwithstanding the scorching heat of the sun.

When people enter the house of a person for whom they have any respect, they always pull off their slippers and go in bare foot.

The women also wrap a cloth about their middle, which hangs down to the calf of their legs. They cover their breasts with another cloth, the ends of which hang over their shoulders. They have no shirt, for this is only worn by the men; nor any covering for their heads but their hair. The common people are almost naked, and wear neither shoes nor slippers. The women wear as

many rings on the three last fingers of each hand as they can keep on, and bracelets upon their wrists and ankles, with pendants in their ears shaped like a pear.

The men bathe two or three times a day, and never make a visit before this is performed: sometimes they go into the water, and at others have water poured on their heads for an hour together; after which they perfume their bodies, and use a sweet pomatum that adds to the natural paleness of their lips.

The women also bathe in the rivers, and swim like the men, but never without the cloth that hangs from the waist. Loubiere commends them for their modesty, and says, that smutty songs are prohibited by law.

The Siamese have a ready and clear conception, and their rapartees are quick and smart. They imitate any thing at sight, and in one day are said to become tolerable workmen; but through their invincible laziness never rise to great perfection in any art or science, not even in astronomy and chemistry, in which they seem to take most delight.

They are neither lascivious nor intemperate: these vices they hold in abhorrence, and therefore wanton discourse never passes among them for wit or a mark of extraordinary genius. The better sort of people are so far from being addicted to drunkenness, that they esteem the drinking of arrack and brandy intemperate, and adultery is hardly ever heard of at Siam. They have an aversion to blood; but if their rage and revenge excite them to spill that of an enemy, they do not care to hazard their own persons by a duel, but proceed by assassination: however, most of their quarrels end in ill language, and sometimes, but very seldom, come to blows.

Yet they are in general polite and courteous; but they are too apt to be haughty to those who submit to them, and submissive to those that treat them with arrogance. They are timorous, careless, and indolent; fond of the customs of their ancestors, and but little inclined to alter their fashions, or to admire the curiosities of foreign nations. Their minds are as calm as their heaven, which changes but twice a year, and that insensibly from rain to fair weather, and from fair weather to rain. In short, says Loubiere, they have naturally the command of their passions, which we, with all our religion and philosophy, find so difficult to conquer. When they would profess the sincerest friendship, they do it by drinking out of the same cup.

They are fond of their wives and children, and are as well beloved by them. Their children are said to be of a sweet temper, and so engaging, that even the king makes it a great part of his diversion to play with them till they are about seven years old; but when they lose their childish innocence, he dismisses them for others.

Their principal food is rice and fish. The sea affords them small oysters, turtles, and lobsters, and several excellent kinds of fish unknown in our seas: they have likewise great plenty of river fish, particularly eels; but they do not much admire them, for they prefer dry salt-fish, even though it stinks, to that which is fresh; and they are very fond of balachaun made of small fish reduced to a mass, which has been already described in treating of Tonquin. They have no aversion to rats, mice, lizards, and locusts, any more than the Chinese.

A Siamese will live a whole day upon a pound of rice, which may be bought for a farthing, and as much salt-fish as he can purchase for a farthing more, and be extremely well satisfied; and as a pint of arrack is not worth more than two-pence, the meanest of the people are under little care about their subsistence, and nothing is heard in their houses of an evening but singing.

They milk the female buffalo, and this milk it is said affords more cream than cows milk; but they make little butter, and no cheese: they seldom eat flesh; but when they do, choose the intestines, and what is most disagreeable to us. The land-fowls, and all butcher's meat, is dry and tough, and the Europeans who reside at Siam soon leave off eating them.

Their ordinary drink is river water, for there are few springs in the flat country, which is most inhabited, and they are fond of drinking it perfumed. When the waters retire the rivers are filled with mud, and the water cannot be drank without standing three weeks or a month in jars; for

for if it be drank when first taken up, it occasions dysenteries and other disorders. The water drank by the king of Siam is taken out of a great cistern that stands in the fields, and is constantly guarded by soldiers: there is also a lake about three leagues in circumference, which they call the Rich Sea, where the rain-water is preserved, of which the king sometimes drinks; for it being deep, the waters are accounted wholesome.

The Siamese drink tea at their entertainments, and use it also as a remedy against the head-ach: they sip it with little bits of sugar-candy in their mouths, and put no sugar into the dishes. The Siamese poor make no scruple of drinking wine or strong drink, though it is forbidden by their religion; but their country affords no strong liquors except arrack and toddy. As they are excessively fond of fruit, they eat it all day long.

A person's standing before a man of quality, or before his master, is esteemed insolent; and therefore slaves and people of inferior rank sit upon their heels, with their heads a little inclined, and their joined hands lifted up to their foreheads. In passing by a superior they bend their bodies, joining their hands, and lifting them towards their heads in proportion to the respect they would shew. When an inferior pays a visit, he enters the room stooping, prostrates himself, and then remains upon his knees, sitting upon his heels without speaking a word, till he is addressed by the person whom he visits; for he that is of the highest quality must always speak first. If a person of rank visits his inferior, he walks upright, and the master of the house receives him at the door, and waits on him so far when he goes away, but never farther.

The highest part of the house is esteemed the most honourable, and no person cares to lodge under another's feet. The Siamese indeed have but one story, but the rooms rise gradually, and the innermost, which are the highest, are always the most honourable. When the Siamese ambassador came to the French court, some of his retinue were lodged in a floor over the ambassador's head; but they no sooner knew it, than they were struck with the greatest consternation, and ran down tearing their hair at the thoughts of being guilty of so unpardonable a crime.

The right hand is esteemed the most honourable at Siam, as well as in Europe; and the first place in a room is that opposite to the door, which is always offered to strangers. A person's coming unexpectedly into company frequently occasions a general remove, for every one must sit in a place suitable to his quality; and the posture is also different according to the respect they are to pay. In some cases they may sit upright, in others their bodies must bend a little; sometimes they may sit cross-legged; but one much inferior to the company must remain on his knees, resting on his heels. Before the king they fall upon their knees, bowing their faces to the ground, and lie in that posture, resting upon their elbows. In short, a man would be cudgelled in any company who should not observe the posture prescribed him.

The Siamese never allow of the familiarity practised by gentlemen in Europe. easiness of access and affability to inferiors is in that part of the world thought a sign of weakness, and yet they take no notice of some things which would be looked upon as ill breeding among us; such as belching in company, which no man endeavours to prevent, or so much as hold his hand before his mouth. They have an extraordinary respect for the head, and it is the greatest affront to stroke or touch that of another person: nay, their cap must not be used with too much familiarity; for when a servant carries it, it is put on a stick and held above his head; and when the master stands still the stick is set down, it having a foot to stand upon. They also shew their respect by lifting their hands to the head; and therefore, when they receive a letter from any one for whom they have great respect, they immediately hold it up to their heads, and sometimes lay it upon their heads.

The persons who are intrusted with the education of youth, teach them to express all the modesty and submission imaginable towards their superiors, and particularly not to be too noisy or talkative; for in the king's court, and in the houses of the great, a profound silence is almost constantly observed. They are so cautious of saying any

thing that is shocking, that they will not relate a known truth which they apprehend will disgust any of the company. They rather seem desirous to learn and be instructed by their superiors, than rudely to offer their opinion without being in a manner compelled to give it. They are so far from insulting any for their ignorance, that they think it very ill manners to pretend to be wiser than the company. In short, they, like the Chinese, seldom speak in the first person: thus the words I and You seem to be banished from conversation. When they speak to women or their superiors they always use some respectful epithet, particularly in their addresses to the softer sex: they not only stile her lady, or princess, but, let her be ever so old, add young to it; for they imagine that none of the sex can with patience think themselves aged, or, which is the same thing, subject to the infirmities that render them disagreeable to the other.

As to their manner of travelling, they not only ride on the elephant, but on the ox and the buffalo; yet use neither horses, asses, nor mules; however, the Mahometans have some camels, which are brought from other countries. The male elephants are trained for war, and the females chiefly used for carriage. Every man is at liberty to hunt elephants, and to take and use them, but not to kill them.

Their more commodious method of going abroad is in a kind of chair, placed on a sort of bier carried by four or eight men on their shoulders, one or two to each end of the poles, while others run by to be ready to relieve them. Some of these chairs have a back and arms, but others are only encompassed with a rail about half a foot high; they are generally open at top, and the Siamese sit cross-legged on a cushion at the bottom. The king only suffers a few of the great men to ride in chairs. The Europeans are allowed the use of palanquins, or couches covered with a canopy, carried on mens shoulders.

S E C T. IV.

Of the Marriages of the Siamese. The Ornaments of the Bride. The Customs in relation to Divorces. The Industry and Chastity of the Wives. Their Funeral Ceremonies different according to the Circumstances of the Relations.

IF a person intends to marry his son into any family, he employs some woman to make the proposal to the girl's relations; and if it be accepted, an astrologer is called in to calculate the nativity of the young man and his mistress, to know if it will prove a happy match, and to ask him whether the family they marry into is rich; for the tyranny of the government induces every one to conceal his wealth. Upon the astrologer's answer both sides form their resolutions; and if the parents be agreed, the youth is allowed to visit his mistress three times, and make her a present of betel or fruit. The relations are present at the third visit, and then the lady's portion is laid down; and the marriage being looked upon as complete, presents are made them by their friends. Soon after they proceed to consummation, without performing any religious ceremony, for the talapouns are prohibited by their law from being present at these solemnities: however, some days after they go to the house where the wedding is kept, and sprinkling the married couple with holy water, repeat some prayers for their happiness.

The wedding, as in other parts of the world, is attended with mirth and feasting, and persons are hired to dance and divert the company; but neither the married couple nor their relations ever dance upon these occasions. The entertainment is made at the house of the bride's father, where the bridegroom has an apartment built on purpose; and there the new-married couple remain some months, and then remove to a dwelling of their own.

The ornaments worn by the daughter of a magistrate at her wedding are a circle of gold like that worn by the magistrate on his cap of ceremony; her cloaths are richer than ordinary; she has more rings than usual on her fingers, and her pendants are of greater value.

They are allowed more wives than one; but this liberty is seldom taken, unless by the great men, and that is said

to be chiefly done for state. When they have several wives one is intitled the chief or great wife, and the others are purchased and attend upon her. The children of their inferior wives call their father lord as well as father; and the other only call him father. None but the children of the chief wife inherit the husband's estate; for those of the inferior wives are esteemed slaves, and both they and their children may be sold by the heir.

The wives of the Siamese work for their husbands, and maintain them all the time they are in the king's service, which is at least six months in the year; and sometimes they are compelled to serve the prince two or three years together. The liberty of divorce is allowed; but it is only in the husband's power to divorce his wife, and then he restores the portion she brought: the children are equally divided between them, unless there be an odd one, which falls to the woman's share; for she takes the first and third and all the odd numbers, and the husband the rest. After the divorce they are both at liberty to marry again, on the very day if they think fit. But though these divorces are allowed, the people think them very disreputable.

The husband has an absolute authority in his family, and may sell all his wives and children except the chief; and after his death the widow has the same power, except the children of the even number, which the father's relations may oppose her selling.

There is no scandal in unmarried people, who have the disposal of themselves, lying together. The women of Pegu who live at Siam offer themselves to foreigners, and continue faithful to them while they remain there. They are proud of being pregnant by a white man, and are not the less esteemed on that account: but Loubiere observes, that the Siamese women will not easily admit foreigners to their bed.

Though the Siamese women manage all the trade, and enjoy perfect liberty, it is said they will not admit visits from men, and are more jealous of their husband's honour than the husbands themselves. The wives of people of distinction seldom stir abroad but to the temples, or to make a family visit. This does not proceed from their being restrained by their husbands, but from their placing their glory in their chastity, which renders them extremely cautious of giving the least colour for scandalous reports; and it is observed of the Indian women in general, that they had rather die by the hands of their husbands, than be taken prisoners by their enemies.

Though this is the character of the women in general, there are instances of ladies who have hazarded their lives to gratify a lascivious disposition; but this principally happens among the wives of the great, or the royal concubines, who are perhaps slighted and neglected by their tyrants. However, the Indian princes seldom fail to punish with the most cruel death those who prove unfaithful to their bed, though the unhappy creatures, perhaps, whom they have thus imprisoned in their seraglio, are hardly known to them; and, as a late author justly observes, only seek to gratify that propensity heaven has implanted in them, and to propagate their species in a way which they cannot be ignorant nature designed they should. Loubiere mentions one of these unhappy creatures, whom the king ordered to be thrown to the tygers; and on their refusing to seize on her, his majesty offered her a pardon; but she chose to die rather than live any longer under his tyranny: upon which the tygers were set upon her, and he had the inhumanity to stand and see her torn to pieces. The penances of the seraglio must surely be great, when these unfortunate creatures rather choose to be devoured by wild beasts than to endure them. The king, it seems, is less cruel to the gallant, who frequently atones for his crime by suffering the bastinado.

When a Siamese dies, his corpse is immediately put into a coffin lackered and gilt, which is placed upon a table in the house, till the preparations are made for the funeral, and the head of the family can attend the solemnity: in the mean while they burn perfumes, and set up lighted tapers before it. The talapouns also range themselves round the sides of the room every night, and entertain the family with hymns and discourses suitable to the occasion.

Mean while a square spot of ground near some temple is inclosed with a bamboo pale, on which are hung painted

and gilt paper, made by the family in the form of houses, goods, animals, and the like. In the middle of the square is erected the funeral pile, which, besides other wood, has yellow sanders, lignum-aloes, and other sweet woods, according to the ability of the family; and the pile is raised of earth as well as wood to a great height.

The body is always carried to the pile in the morning, with the sound of several kinds of instruments, attended by the family of the deceased; both men and women are clothed in white, and wear white veils, all the way uttering their lamentations: these are followed by their friends and relations. Being got to the place, they take the body out of the coffin, and lay it on the pile: the talapouns sing doleful hymns for about fifteen minutes, and then retire, it being unlawful for them to be present when the shews and plays are exhibited, as they always are on these occasions, when there is likewise a kind of festival. The relations of the deceased seem not at all moved by these representations, but continue uttering their lamentations.

A servant belonging to a talapoun sets fire to the pile about noon, which having burnt about two hours, is utterly consumed; but the painted papers, which should have been burnt with the deceased, are frequently seized by the talapouns, in order to be sold at some succeeding funeral, not regarding the occasion the deceased is supposed to have for them in the other world. All the company are entertained by the family during three days, and they also bestow alms on the talapouns of the convent near which the funeral is solemnized, and are likewise at the expence of fire-works. This can only be understood of the funerals of the great: but when a son is not in circumstances to perform all this at the time of his father's decease, he causes the body to be buried; and if he afterwards grows rich, he will sometimes have it dug up to make his father a noble funeral, and to have the corpse burnt with all those ceremonies which, they imagine, best shew their respect to his memory.

The remains of the corpse that is unconsumed is put into the coffin, and interred under one of the pyramids that stand about the temple; and sometimes they bury with it precious stones and other treasure. These pyramids serve instead of tombs, but have no epitaphs upon them; and the pyramids are so slightly built, that they seldom last above one century. These burying-places are said to be held so sacred, that none dare touch the treasure deposited there; but Loubiere asserts, that he has known people borrow files of the Europeans to cut the iron bars which secure them.

Persons of quality usually erect a temple on purpose near the place where they design to have their tombs; and those who cannot be at that expence, present some idol to a temple ready built. Those who are poor bury their parents, as hath been already hinted, without being at the expence of a funeral pile; but if they cannot afford to hire the talapouns to sing the usual hymns, which is the lowest degree of respect they can pay to their deceased parents, they expose them on a scaffold to be devoured by birds of prey.

Those who die for their crimes, children still-born, women who die in childbed, suicides, and others who come to an untimely end, are never buried, it being thought that they have drawn the judgment of heaven upon them by their crimes.

SECT. V.

Of their Languages and their Skill in the Sciences.

THERE are two languages spoken in this country, the Siamese and the Baly. The Siamese tongue has thirty-seven letters, and the Baly thirty-three, all of which are consonants. The vowels and diphthongs in both languages have peculiar characters, some placed before the consonant, and others after; some above, and others underneath; and these vowels and diphthongs, thus variously disposed, are always pronounced after the consonant. Loubiere thinks it probable that, like the Hebrews, they at first wrote without vowels, and afterwards proceeded to mark the consonants with strokes foreign to their alphabet, like the points which the modern Jews have added to the Hebrew.

The

The Siamese tongue chiefly consists of monosyllables, that have neither conjugation nor declension. The Baly is a dead language, known only to the learned: yet the terms of their religion and laws, the names of offices, and all the ornaments of the vulgar Siamese tongue, are taken from the Baly; and in this language too their best songs are composed.

As the Siamese have not the invaluable art of printing, they have but few books. Their histories do not go far back, and those they have are filled with fables, and deserve little credit.

When their children are seven or eight years of age they send them to school to a convent of talapoins or priests, where they assume the talapoin's habit, which they can quit at pleasure. They subsist upon the food sent them by their friends; and those who belong to families of distinguished rank have a slave or two to attend them. They are there taught reading, writing, and arithmetic. They also learn the Baly tongue, with some principles of morality and the mysteries of their religion; but are not instructed in history, the laws, or any speculative science.

They write, as in Europe, from the left hand to the right; and their works, like those of other eastern nations, abound in lofty figures and metaphorical expressions.

As to arithmetic, they have, like us, ten characters, one of which is a cypher; and they likewise reckon by units, tens, hundreds, and thousands.

They are unacquainted with the charms of oratory, and are said to have no orators among them; for there are none whose profession or interest lead them to that study, every man pleading his own cause without a counsellor. His allegations and proofs are taken down by a register, after which the magistrate determines upon them. The making of set speeches is not at all in fashion at Siam; for it is ill manners to address a superior in any terms, though they are ever so respectful. When a person appears before a superior, he must only answer such questions as are proposed to him. Even the compliments and words of ceremony are, like those of the Chinese, all prescribed: so that a man of wit has no room to display his talents.

Their poetry consists in a certain number of syllables properly ranged, to which, it is said, they add rhymes: but their poems are extremely difficult to translate. Some of their songs are historical, others contain rules of morality, and others are on subjects of love and gallantry.

They have little idea of philosophy; nor do they study the laws of their country, till they are preferred to some post, and then a copy of instructions is put into their hands, as rules to be observed in the discharge of their office.

Their astronomy is very imperfect, for they have no knowledge of the true system of the world; they, as well as the Chinese, imagine that eclipses are caused by some dragon, who stands ready to devour the sun and moon; and make a great clattering with pans and kettles to frighten him away. The earth they believe to be square, and of a vast extent, and that at each corner there is a solid basis on which rests the arch of heaven.

Neither the king nor any of his subjects will undertake any affair of importance without consulting their astrologers, nor will he venture to stir abroad if they declare it to be an unlucky hour: but if they deceive the king when he consults them, he orders them to be bastinadoed, not as impostors, but for their carelessness.

They are also governed by presages and omens. Thus the howling of wild beasts and the cries of apes are ominous; and a snake's crossing the way, or any thing falling down without any apparent cause, is sufficient to fill them with terror.

They have very little skill in medicine; the king has Chinese, Peguans, and Siamese physicians; but when any of them administer a remedy to his majesty that has not the promised effect, he orders him to be well drubbed. They have not the least skill in surgery, and are forced to make use of European surgeons when they would be let blood, which has been but lately practised amongst them. The physicians seldom vary their receipts, but follow those they received from their ancestors, by which means they cure many distempers; but when the disease is too strong

for them, they always pretend that the patient is enchanted. The physicians sometimes make use of purging, but never of vomiting: they cure most diseases by sudorifics, and are said to advise bathing in fevers; but it is observable, that they never allow the patient to eat any thing but conge, or rice-gruel, till his disease has left him; and this regimen may possibly conduce to their recovery more than all the remedies they prescribe.

The principal diseases of the country are dysenteries and fluxes, to which foreigners are much more subject than the natives; but agues, the gout, the stone, phthisic, scurvy, and dropsy, are seldom heard of here, or in any other hot countries. The small-pox, however, frequently proves very fatal, and is almost as mortal as the plague in other countries: to prevent infection, they bury those that die of this loathsome disease, but three years after dig up the remains of their bodies, and burn them on their funeral pile.

Notwithstanding the heat of the country, they keep lying-in women continually before a great fire for a whole month, in order to purify them, and during this time they are almost suffocated, there being only a hole in the roof to let out the smoke. At their first sitting up they return thanks to the fire for purifying them, and the meat with which they treat their friends is, on these occasions, offered to the fire. They will not suffer the lying-in women to eat or drink any thing that is not hot.

They have no greater skill in music than in the other sciences: they neither sing nor play by notes, nor do they know what is meant by playing in parts. Most of their instruments are very harsh and disagreeable to the ear: they beat upon small ill-sounding drums, and have a trumpet that makes a still more disagreeable noise: they have some shrill hautboys, and a little disagreeable violin with three strings: they likewise beat on brass basons; and when the king goes out, and upon other solemn occasions, all these sound together, and the noise is said to be not disagreeable on the river.

Their calendar has been twice regulated by able astronomers, who have taken two remarkable epochas; the most ancient is the 545th year before the birth of our Saviour, which they say commences from the time in which their saint Sommona Codom was translated to heaven. The last epocha commences from the year of our Lord 638.

The year is divided by them into three seasons; the cold months, which answer to those of December and January; the little summer, or the beginning of heat, which is their spring, and answers to February, March, and April; and the great summer, or the time of their great heats, which includes the other seven months, when the heat strips some of their trees of their leaves, as the cold does ours.

They begin the year at the first moon of November or December: their months for the most part consist of thirty days, but they have no names for their months, but reckon them in order, as the first, second, and third month: they have likewise no word to express week; but, as in Europe, call the seven days by the names of the planets.

Their days are divided into twenty-four hours, as in Europe, and they have four watches for the night, the last of which ends at broad day-light. They have no clocks; but as the days are always of an equal length, they easily know the hour by looking at the sun. In the palace they have a hollow copper vessel with a little hole in it, which being set upon the water, lets it in by degrees, and it sinks when the hour is out. This enables them to distinguish the hours of the night, which they make known by striking on copper basons.

S E C T. VI.

Of the City of Siam, and its Temples. Of the Streets, Houses, and their Furniture.

THE city of Siam, the metropolis of the kingdom of the same name, is sometimes called Odioa, and by the natives Siyothiya. It is situated on the river Menan, which signifies the sea of rivers, in about fourteen degrees thirty minutes north latitude, and in the hundred and first

first degree of east longitude from London. It is nine miles in circumference, and being encompassed by several branches of the river, is rendered almost an island, only towards the east there is a causey to pass out of the town. By land it is surrounded by a wall fortified with towers, and is called by the natives the admirable, and the excellent city, because they believe it impregnable; and indeed it is said to have resources within itself sufficient to support a siege of many months against an army fifty thousand strong; and has an infallible succour which never fails; this is the river overflowing every six months; for there are no lines which it will not carry off, nor army which it will not oblige to retire. But the city itself does not take up above a sixth part of the ground within the walls, for there are between two and three hundred pagodas, surrounded by as many convents of talapoins. Round these temples are also their burying-places, with pyramids erected over them, which, with their spires, and the glittering towers of the pagodas, form a very agreeable prospect.

The riches of the country are chiefly displayed in these pagodas and the prince's palace, by the workmanship in gold with which they are adorned, by their prodigious bulk, their admirable structure, and incredible number of jewels.

The magnificence of the pagodas surpasses every thing of the kind to be seen in the Indies. The most celebrated of these is that in the king's palace. While the spectator is startled at seeing on one side of the portal an horrible monster, and on the other a cow, his eyes and imagination all at once lose sight of the objects, and are dazzled with the splendor of the walls, the ceiling and pillars, and of an infinite number of figures so properly gilt, that they seem covered with plates of gold. Having advanced some steps, a small elevation appears in the form of an altar, on which are four figures said to be of massy gold, nearly as big as the life, sitting cross-legged; beyond it is a kind of choir, where there is the richest pagod or idol in the kingdom. This statue is about forty-five feet in height, and being in a standing posture, touches with its head the vault of the choir. But what is most astonishing, it is said to be of solid gold. This those who accompanied the French ambassador were told, and this they believed; but it is only finely gilt. It is also pretended, that this rich colossus was cast in the place where it stands, and that afterwards they built the temple about it. On its sides are others of less value, which are also gilt, and enriched with jewels.

At an hundred paces from the palace is another temple, which, though not so rich, is a regular and beautiful structure, adorned with five cupolas, of which that in the middle is larger than all the rest; the roof is covered with gilt pewter. Forty-four pyramids surround and adorn the temple: these are placed in three rows, and in different stories. In the circuit which incloses these buildings, all along the galleries, are above four hundred clay statues gilt.

The principal pagoda in the city contains near four thousand idols all gilt, besides the three principal ones falsely said to be of massy gold. That which passes for the second is six leagues from the city, and is only open for the king and the priests; the people remain prostrate before the gate, with their faces to the earth. The third is in the Dutch island, where the principal idol is surrounded by above three hundred others of different dimensions, and in all manner of postures.

The streets of this city are large and straight, some of them are even paved with brick, and have canals cut through them; so that there are few houses to which there is not access with a boat. The convenience of transporting their effects, and landing them quite from the sea at the magazines, and the other advantages of the kingdom, have drawn traders thither from all parts of the world. Over these canals are many arched bridges built of brick or stone, and some of wood, on which account this city has been compared to Venice. Most of their houses are built with bamboos, and erected upon pillars of the same wood thirteen feet above the ground, the lower part underneath the house not being of any use.

Their floors are also made of split bamboos, and covered with mats; their walls are of the same materials.

They have no glazed windows; their roofs are shaped like those of a barn, and instead of stairs they ascend by a ladder; but in the time of the inundation make use of boats, every man having one tied at the door, for they are all very expert at rowing. They have neither chimneys nor hearths, for they seldom light a fire but to dress their meat, and then a basket of earth serves them instead of a hearth, and a hole in the roof instead of a chimney.

These buildings are not contiguous, nor do all the family, if it be very large, dwell under the same roof; but every man's ground is paved in with bamboo, and within this inclosure are several small tenements erected on pillars, according to the quality of the person, and the number of his dependants and slaves. Their cattle are also kept in upper rooms to preserve them during the inundation. A few houses are built by foreigners with brick, and the king has erected others of the same sort for the accommodation of foreign ambassadors. The Christians, Mahometans, and Chinese, instead of building their houses on pillars, raise the ground on which they build high enough to be secure from the annual inundation.

Neither the palace, nor any private houses, exceed one story high, yet there is frequently a great difference between the height of the front and that of the inward rooms, both in the floors and the roofs. The first or outward room is always the lowest, and from this you ascend by two or three steps to another, then to a third, and so on in a direct line, the roofs rising proportionably.

The palaces of the great officers of state have usually three floors and roofs rising one higher than the other; and in that of the king there are at least seven. The entrance to the first room is by very straight stairs, and a narrow door to the right or left of the building.

As to their furniture, some have couches covered with a mat, only broad enough for one person to lie on; for they all lie single, except the poor, who sleep together on the floor. These beds, or couches, have but one curtain, which is drawn before them, that the people may not be seen sleeping. Instead of a feather-bed they make use of a mattress stuffed with cotton, and have also a pillow and one sheet to lie upon, with a quilt over them.

As they sit upon the ground they have little lackered tables, with a border round them, but no feet; and every man at his meals has one to himself. They have also cabinets, chests of drawers, China-ware, copper, and earthen vessels.

These are the principal furniture of their houses, unless we reckon their tools; for as there are no particular trades, every family has a set of working tools; but there being no iron nails, all the beams, rafters, boards, and wooden work are fastened together with wooden pins.

Their bricks, with which several of their temples, palaces, and pyramids are built, are said to be tolerably good; and their cement greatly exceeds ours, for a wall that is plastered with it looks like polished marble; but as their buildings are without foundations, none of them will stand long.

S E C T. VII.

The King's Palace, his Guards, Elephants, and Horses. His Influence and tyrannic Power; his Revenues, and the Manners of his Court.

THE persons who accompanied the French ambassador say, that the king's palace, both within and without, is even more splendid than the temples. It is situated on a small eminence, and extends to the banks of the river. Though in extent it may be compared to a city, all its towers, pyramids, and elevated buildings are gilt. The apartments of the king and queen contain inconceivable riches; gold and precious stones are said to shine on all sides.

This edifice is on the north side of the city; it is built with brick, and surrounded by a treble inclosure, with large courts between each wall. The inner court, which contains the king's apartments, includes several gardens, adorned with groves and canals, in which are airy rooms,

each encompassed by a low wall, and the roof supported by pillars; in these rooms ambassadors are entertained. The Siamese fall prostrate on the ground whenever they enter or leave this inner court, and never pass by the gates of the outer court of the palace but at an awful distance.

The gates of the palace are usually kept shut; and if any one desires admittance, the officer who commands the guard is informed of it, and suffers no person to enter armed, or who has drank any spirituous liquor, and therefore he smells the breath of every one who enters. Between the two first walls stand a guard of unarmed soldiers, who also serve the king in the office of executioners: these amount to about six hundred. They have arms ready for them in the palace; but they are never trusted with them, except on extraordinary occasions.

The horse-guards are composed of the natives of Laos and Mecn, and are divided into two bodies commanded by their respective officers. The king has likewise another guard of horse, composed of one hundred and thirty gentlemen, two troops of which, consisting of thirty men each, are natives of Indostan. Another troop consists of twenty Chinese Tartars, armed with bows and arrows; and two other troops of Rasboots, who are natives of India Proper, and consist of twenty-five men each. All the horse-guards attend the king when he goes abroad, but none are ever suffered to enter the gates of the palace. The king finds every trooper his horse and arms.

After mentioning the guards, it will not be improper to take notice of the king's elephants and horses, which have their stables within the first inclosure, on entering the palace. Every elephant has several men to look after him, and is treated with more or less honour according to the name he bears, which is given him by his majesty. They never stir out without their trappings and ornaments; and are so tractable and sagacious, that the people imagine them animated by illustrious souls that had formerly inhabited the bodies of great men. The white elephant, which they pretend is the only one in the world, they believe to have the soul that once resided in the body of some prince, and for this reason the king never rides upon him. He is not entirely white, but of a sort of flesh colour, and therefore some call him the white and red elephant. They have almost as much respect for a white horse as for an elephant of that colour, and these are the favourites of the king. Next to the white elephants they esteem those that are black, they being the scarcest, except white; and they frequently colour them, when they are not naturally so black as they would have them. It ought not to be omitted that there is seldom more than one white elephant, and that he is served in gold plate, and treated as the sovereign of the rest of his species.

The king's barges and galleys are kept in an arsenal on the side of the river opposite to the palace.

Haughtiness, despotic power, and an absolute government, are the only marks by which the king of Siam chooses to be distinguished from other sovereigns. The respect he requires from his people reaches almost to adoration; and the posture in which they must appear in his presence is a testimony of it. Even in the council, which sometimes lasts four hours, the ministers of state and the great officers are continually prostrate before him. They never speak to him but on their knees, with their hands raised to their heads, making at every moment profound reverences, and accompanying their discourse with pompous titles, celebrating his power and goodness. They receive his answers as oracles, and his orders are instantly executed without the least opposition. When he goes abroad all are obliged to keep within doors. His subjects are slaves, who possess nothing but what belongs to him. Even nobility is not hereditary; it only consisting in honours and employments, which the prince bestows, and whenever he pleases may withdraw.

His revenues arise both from lands and goods: he has a quarter of a teal, or about nine-pence per annum, for every forty fathom square of all the cultivated lands he lets out to his subjects. He likewise receives one teal, or three shillings per annum, of each boat for every fathom it is in length; and receives not only the customs

on goods exported and imported, but also a certain sum for the ship itself, according to its capacity; he has besides a duty upon arrack, and lays an annual tax on all the most valuable fruit-trees, as cocoa-trees, durions, mangoes, oranges, and those that afford betel. He has also demesne lands and gardens in most parts of the kingdom, which are cultivated by his subjects, without any expence to himself, and supply the court with provisions. Another part of the revenue arises from the presents he receives from his subjects, and what falls to him upon the death of his officers: the fines and confiscations he receives on the condemnation of criminals is another valuable article; as is also the six months service paid him by the people, for which he frequently compounds; for the rich are willing to avoid performing this drudgery. Besides all this the king, as will hereafter be shewn, engrosses most part of the trade of the kingdom.

However, all that part of his revenue which he receives in money does not amount to more than six hundred thousand crowns; but what he receives in kind, and by the produce of his demesne lands, for the provision of his household, keeping his slaves, and his elephants, is prodigious; and, besides, all his officers maintain themselves, as do also his troops: he has likewise the service of one-half of his subjects annually, without any expence to himself; and he sometimes levies taxes for the support of ambassadors, the erecting of public buildings, and on other extraordinary occasions.

From these several articles he receives an immense revenue: hence the riches of the royal treasury are worthy of a great king; but the vast collection of gold, silver, and jewels deposited there has been accumulated by a long succession of monarchs, the Siamese valuing their kings in proportion as they have enriched the treasury, while at the same time they are not permitted to touch it, whatever necessity they may have for it.

In short, the principal wealth of the kingdom is deposited in the royal treasury, the palaces, and the temples; and there is none rich but the king. Count Forbin says, that the situation in which he found the persons who composed the court of Louvo surprized him extremely: they were seated in a circle on mats of slender osier; they had only one lamp before them, and when one of them wanted to read or write, he took the end of a yellow candle out of his pocket, and lighting it at the lamp, put it on a piece of wood, which, turning from side to side on a pivot, served them for a candlestick.

Forbin himself had the honour to be made lord-high-admiral and general of the forces of his Siamese majesty; but his fortune ill suited the pompous titles bestowed on him. They gave him a house as plain as it was little, whither they sent thirty-six slaves to serve him, and six elephants. The maintaining of his household cost him only five sols a day, so temperate are the men, and so cheap the provisions. He himself had his table at the minister's; his house was furnished with a very few inconsiderable moveables; to which were added twelve silver plates and two silver cups, all very thin; four dozen of cotton napkins, and two yellow wax-candles a day.

The king usually shows himself to his courtiers from a window, which looks into the hall of audience, at the entrance of the inward palace, and is so high, that the French ambassador was forced to stand upon three steps to deliver the king's letter, which was presented in a gold cup, as every thing else is which he receives from his officers.

Within this hall are constantly forty-four pages, or young gentlemen divided into four companies under their respective officers. These prostrate themselves at the time of audience, half on the right hand, and half on the left. It is their office to dispatch the king's orders to his officers, and they have also several employments within doors: some serve his majesty with betel, others take care of his books, and others read to him.

He has one officer, who never prostrates himself before him, but has his eyes constantly fixed upon him, to receive his orders, which he understands by certain signs, and by signs also communicates them to the officers who wait without.

All the officers of the king of Siam's bed-chamber are his women; for none else are admitted there. They make his bed and dress him, but he alone puts on his cap; for none must touch his sacred head, or put any thing over it. His women also dress his provisions, and wait on him at table. The meat is carried in to the eunuchs, who deliver it to the women; and it is said the very salt and spices are put in by weight.

Though the women alone dress his majesty, there are gentlemen of his wardrobe, the most considerable of whom is the person who has the care of the king's cup.

The queen is generally one of the royal blood; and the French ambassador says, that in the year 1663, when he was there, the queen was the king's daughter by his own sister, and that the rest of the women treated her as their sovereign. She had the command of the black and white eunuchs, who were not above ten or twelve in number, and punished both them and the women, as she thought proper. The queen has her elephants and her barges to attend her when she goes abroad, but her chair is inclosed with curtains, through which she can see every thing, without being seen, and all the people get out of the way, or prostrate themselves, when she passes by. She has also her magazines, her ships, and treasure distinct from the king's, and carries on trade on her own account.

The queen's son does not always inherit the crown; but usually the king's eldest son by the first woman that brings him a child, and if his majesty does not think him qualified to succeed him, he has the power of appointing another.

When the king goes abroad he is either carried upon his elephant, or in a chair, and is seldom seen on horseback, though he keeps two thousand horses in his stables. Great care is taken to prevent his being seen on foot, he therefore comes immediately out of his apartment, either from some terrace or a window of a proper height, to seat himself on his elephant, and is never lifted upon him. The king's seat on his elephant is uncovered, and open before, and therefore when he stands still, he is sheltered from the sun by a man on foot, who holds a high umbrella. The man who guides the elephant sits on his neck, and governs him by pricking him on the head with an iron instrument. But though he is seldom seen in the city, he frequently hunts at Louvo, when his concubines, it is said, run on foot by him; and he has also a guard of two or three hundred men, who march before him to clear the way, and if he stops, all the company instantly prostrate themselves on the earth.

It is an established rule, that no officer presume to enter into his majesty's presence without leave. The great officers are allowed to visit each other only at weddings and funerals, and then must speak aloud, and in the presence of a third person, to prevent any consultations against the state; besides, every man that hears any thing that may endanger the government, is obliged to turn informer, upon pain of death, and there are also a number of spies to inform the prince of what is spoken in all companies. On the other hand, there is great danger in bringing him ill news, or on letting him know the weakness of his government. No officer dare be so bold as to tell him that it is impossible to execute what he commands; they therefore endeavour to fulfil his orders, and to excuse the miscarriage afterwards, which they do gradually, in the softest terms, and with all possible precautions; for he seldom fails to punish with extraordinary rigour those who offend him.

He frequently examines his officers on their proficiency in the learned language, and on the precepts of their religion, and punishes the ignorant with the bastinado.

The vulgar are in many respects more safe and happy than their superiors, for the less a man is known to the prince, and the greater distance he is from the court, the greater is his security. Honour here leads to danger, not only through the caprice of the prince, but from the encouragement given to informers. Hence the great use every artifice to prevent any accusation reaching the ears of the king.

The eastern princes are indeed ever in danger of being deposed; for as they endeavour to inspire all about them with terror, and think it beneath them to take such measures as will gain the affections of their subjects, there are none of their immediate dependants on whom they can confide; and as the people have no security for the enjoyment of their property, they never give themselves much concern about the title or fortune of their sovereign. They know they shall be no better than beasts of burthen whoever governs, and accordingly very readily submit to him who possesses the regal power. Thus the men, who have been taken prisoners by the king of Pegu, contentedly cultivate the lands he gives them within twenty miles of their own country, without ever attempting to escape back to Siam; and though the Siamese are taught to consider their princes as the sons of heaven, and imagine their souls as much exalted above those of the vulgar as their rank exceeds theirs, yet a subject no sooner usurps the crown than they entertain the same opinion of the usurper they had of their prince, and they are ready to believe that heaven has adopted the rebel in his room.

The great officers of state appear almost under the necessity of oppressing the people, for they have no salaries, and have only their lodgings, a barge, and a few moveables allowed them by the crown; with elephants, horses, buffaloes, and slaves suitable to their rank, and as much land as will keep their families in rice; all which return to the crown upon their being displaced: presents are therefore publicly made them by those under their command, and a judge is not punished for taking money of the parties, except it can be proved that he has been also guilty of injustice.

Councils of state are held twice a day; at ten in the morning, and at ten in the evening. At these councils any member to whom his majesty has referred the management of an affair, reads his instructions, and gives an account of what he has done. The several members then deliver their opinion in his majesty's absence: afterwards, when the king is present, their debates and resolutions are reported to him, which he examines and then determines as he thinks fit. If the affair be attended with any difficulty, he orders it to be reconsidered, and sometimes consults the superior of the talapouns. As he frequently punishes those who give him what he thinks ill advice, his ministers offer such opinions as are likely to please him, which is safer than their declaring their own.

S E C T. VIII.

Of Ambassadors, the Manner in which they are received, and of those sent by the King

TH E R E is no addressing this prince without considerable presents, and, in return, he expresses the highest value for what is given. If it be any thing to wear, he puts it on in the presence of the ambassador, and if they present horses, stables are immediately built for them.

Before the ambassadors have delivered their presents, the king's officers come and take a very exact account of them, and enquire the value and use of the minutest articles, in order that they may be able to answer all the questions the king may ask them; but their principal design is to discover their true value.

An ambassador at Siam is only regarded as a royal messenger, and much greater honour is paid to the letter he carries than to him. When the French ambassador went to Siam the king of France's letter and presents were carried in the royal barge, with several of the king's vessels to guard it; while the ambassador and his retinue were carried up the river in ordinary vessels.

Foreign ambassadors are lodged and maintained at the king's expence, and are allowed to trade during their stay; but they are not suffered to transact any affairs till they have had their public audience, or to continue in the city after their audience of leave; and therefore the evening before the king asks, if they have any thing farther

farther to propose; and, at the audience of leave, if they are satisfied. Publick audiences are in the capital, when the court appears in all its splendour. Those given at Louvo and other places are esteemed private audiences, there being few guards and attendants.

The Siamese never send ambassadors to reside at any court, but only to dispatch some particular affair, which generally relates to trade; and upon these occasions they send three, one of whom has the sole management of the affair, and on his death is succeeded by the second, and the second by the third.

S E C T. IX.

Of the Laws of Siam, and the Manner in which Causes are tried. Of the ordeal Trial, as practised by the Siamese, and the Punishments inflicted on Criminals.

THE governor of every province has the sole command, both in civil and military affairs; and though others are joined with him, when he sits in a court of justice, he only consults them, after which he determines all causes by his sole authority.

As to the laws of Siam, they require an unlimited obedience to parents, and, like those of China, subject children entirely to their jurisdiction; and should one presume to oppose and contradict his parents, he would be thought a monster. A more than ordinary reverence is also paid to old age.

Where a man is found guilty of lying to his superior, he may immediately punish him; and the king is said to punish it with greater severity than any other crime.

Theft and robbery are esteemed so infamous, that when a person is accused of them their friends will not interpose in their behalf. This is thought the more scandalous, as one day's labour will furnish a man with provisions for many.

All the proceedings in law are in writing, and none is suffered to exhibit a charge against another, without giving security to prosecute it, and answer the damages if he does not prove the fact against the person accused. When a person intends to prosecute another, he draws up a petition, in which he sets forth his complaint, and presents it to the nai, or head of the band to which he belongs, who transmits it to the governor; and if the complaint appears frivolous, the prosecutor, according to the laws of the country, should be punished; but the magistrates generally encourage prosecutions on account of the perquisites they bring to their office. If the suit proceeds, the governor refers the charge to the examination of his associates, and these again to their clerks, who examine the witnesses at their houses, hear what each party has to say in his behalf, and take it down in writing; and if a person does not care to speak in his own cause, one of his relations may speak for him and supply the place of a counsellor; but no relation more remote than a first cousin is allowed to perform this office.

Every thing being prepared for hearing, the parties are several days called into court, and persuaded to agree; but this appears to be only a matter of form. At length the governor appoints a day for all parties to attend; and being come into court, the clerk reads the process and opinion of his associates, and then the governor examines upon what reasons their opinions are founded, which being explained to him, he proceeds to pass judgment.

When sufficient proofs are wanting they have recourse to an ordeal trial, like that of our Saxon ancestors; both the plaintiff and defendant walk upon burning coals, and he that escapes unhurt is adjudged to be in the right; sometimes the proof is made by putting their hands in boiling oil; and in both these trials, by some peculiar management, one or the other is said to remain unhurt: they have also a proof by water, in which he who remains longest under it is esteemed innocent. They have another proof by swallowing pills, which their priests administer with severe imprecations, and the party who keeps them in his stomach without vomiting is thought to be innocent.

All these trials are made in the presence of the magistrates and people, and the king himself frequently

directs them to be performed, when crimes come before him by way of appeal. Sometimes he orders both the informer and prisoner to be thrown to the tygers, and the person that escapes, by his not being seized upon by those beasts, is sufficiently justified.

The intrepidity with which the people expose themselves to these supposed proofs is very surprizing.

The president of the tribunal at Siam may reverse a judgment given in any of the provinces, and there is an appeal from him to the king, so that were the parties able to bear the expence, which is very great, the suit may be carried from one court to another: but when the poor meet with a powerful adversary, innocence is but a slight protection.

Judgment is never executed in any of the provinces without a special commission from the king; and yet the bastinado and other punishments, frequently followed by death, are inflicted by every governor. It is remarkable that he who unjustly obtains the possession of another's lands is esteemed guilty of robbery, and the person lawfully convicted is obliged not only to bestow the lands, but to forfeit the value of them, one half to the party he had injured, and the other to the judge; and thus are all other forfeitures divided.

To prevent the oppression of the governors, an office, is appointed in every province to report to the king every thing that passes, particularly in the courts of justice; but as the officers generally connive at each other's extortions, the people receive little benefit from this institution.

As to the punishments inflicted on criminals, they are sometimes trampled to death by elephants; at other times they are tossed by one elephant to another without killing them, for the elephants are said to be so extremely tractable as to do this upon a sign made to them. But their punishments are usually adapted to the crime; thus lying is punished by sewing up the mouth; and a person guilty of extortion, or of embezzling the publick money, has melted gold or silver poured down his throat. Beheading is also sometimes practised, and it frequently happens that a prisoner suffers death by the bastinado.

For small crimes people are punished, as in China, by hanging a heavy pillory-board about their necks for several days; and sometimes a criminal is set into the ground up to the shoulders and buffeted about the head. This is the highest indignity that can be offered to a Siamese, especially to if it be inflicted by a woman; however, it is said, that no punishment is infamous longer than it lasts; and that he who has suffered one day frequently enters into the highest employments the next.

S E C T. X.

Of the six Months Service which all the Siamese are obliged annually to perform; and the Manner of their making War.

THAT none may escape the personal service he owes his prince six months in the year, every man is inrolled and divided into bands or companies, which have each their nai or governor. These companies, do not always consist of the same number of men, nor does every nai lead his own men either to war or to the six months service; but is obliged to furnish for each such a number out of his band as the king requires; and the children are of the same band with their parents. The nai frequently lends his men money, and pays off their other creditors; and, if they become insolvent, he may make them his slaves.

The commanders of the barges have a certain number of rowers, who are marked with a hot iron in the wrists; and these their commander dismisses every year, either six months at a time, or by single months, as he thinks proper.

When the Siamese and the Peguans are at war, the armies seldom face each other: they only make excursions, and seizing great numbers of people, retire with all possible expedition. If the armies meet they avoid shooting directly at each other, except in the greatest extremity; if the enemy advances they fire something short, and

and then if any of them are killed or wounded, they say it is their own fault; for when the king of Siam's troops take the field, he orders them not to kill, by which they understand that they are not to fire directly upon the enemy; and whenever the bullets or arrows begin to fly pretty thick, either one side or the other never fails to disperse.

When the body is broke they fly into the woods, where their enemy is seldom so bold as to follow them; and as the armies are very numerous, and consequently find it difficult to procure subsistence, the conqueror is soon forced to retire; and then the vanquished rallying again, perhaps returns the visit. Their greatest strength consists in the elephants; but as they cannot be managed with a bit and bridle like a horse, when they are wounded they frequently turn back upon their masters, and throw the whole army to which they belong into confusion; and it is almost impossible to make them proof against wild fire, though the men fire short guns upon their backs that carry a ball of a pound weight.

The Siamese have some artillery which the Portuguese cast for them; but they have no horse, except those in the king's stables: their army chiefly consists in elephants, and a naked half-armed infantry. They usually draw up in three lines, each consisting of three square battalions: the general is posted in the center of the middle battalion, which is composed of their best troops; and the rest of the commanding officers place themselves in the center of their respective bodies. Where these nine battalions are thought too large, each is sub-divided into lesser bodies. Every battalion has sixteen male elephants in the rear, and two female elephants to attend each, without which it would be difficult to govern them.

As their artillery has no carriages, it is carried in waggon drawn by buffaloes or oxen, with these the fight begins and usually ends; if not they draw something nearer, and make use of their small shot, in the manner already mentioned; but they seldom come to a close engagement: and if it be necessary to make a stand, the officers place themselves behind their men, and threaten them with immediate death if they turn their backs. It is said that the Siamese do not, like most other Indian nations, take opium to inspire them with courage; they are unwilling to run such hazards, for they think death is equally to be dreaded, whether they be drunk or sober.

SECT. XI.

Of the principal Places in Siam.

HAVING given the most material particulars in relation to the manners, customs, and government of Siam, with a description of its capital, we shall take a view of the situation of the principal places of that kingdom, some of which have been cursorily mentioned in the course of this chapter.

Chantebon, or Liam, is situated at the mouth of a broad river, on the west side of the gulf of Siam, in the twelfth degree of north latitude, at the foot of a chain of mountains that separates Siam from Cambodia.

Bangkok is situated in an island formed by the river Menam, about twenty leagues to the south of Siam; between this place and the last mentioned city are numbers of villages on both sides of the river, with huts of bamboo erected on pillars. At this place there is a flat, where it is customary for ships to put their guns ashore. All ships bound to Siam put in here to give an account from whence they came, as well as of their lading and complement; and to pay the customs, an acquittance for which they shew at another place up the river, called Canon-Bantenau, within a league of the city of Siam; and then they have liberty to trade any where through the kingdom, paying only for their cocket, which they are obliged to do on the penalty of forfeiting the ship.

Louvo, where the king spends nine or ten months in the year, is situated in about the latitude of fifteen degrees, thirty minutes, nine or ten leagues from Siam. Between these two cities a canal is cut for the convenience of passage, on each side of which are vast plains

abounding with rice. The king's palace here is of brick, and of great extent, it consisting of two separate piles of building, whose roofs are covered with yellow tiles that glitter in the sun like gold; this edifice is pleasantly situated on an eminence a little to the east of one of the branches of the Merram. The town is well supplied with provisions, but is so populous that they are dearer there than in any other part of the kingdom.

Prabat, a town which lies near sixty-five miles to the north-east of Louvo, is only famous for a mark in a rock, which is pretended to be an impression made by the foot of their great saint Sommona Codom, and thither the king of Siam annually goes in great pomp to pay his devotions.

Tenacerin, a populous city, and the capital of a province of the same name, is situated on a river also called Tenacerin, which falls into the bay of Bengal. It is seated in a country that abounds with all the necessaries of life, and carries on a considerable trade.

Merjee is seated in an island near Tenacerin, one hundred and forty miles to the south-west of Siam, and is said to be one of the best forts in the Indies; but of this place we shall give a more particular account, when, on treating of the trade of Siam, we shall mention the destruction of that commerce which was formerly carried on by the English in this city.

Jonsalam is an island within a mile of the continent, between which is a good harbour for shipping.

Martaban, once an independent kingdom, but now subject to Siam, has Pegu on the north, Siam on the south and east, and the bay of Bengal on the west; it is said to extend three hundred miles from north to south, and an hundred and fifteen, where broadest, from east to west. It has mines of gold, silver, copper, iron, and lead, and abounds with corn, medicinal herbs, oil of jessamine, oranges, lemons, figs, and other fruit. The inhabitants make a sort of porcelain vessels, varnished black, which is much esteemed. The capital is a well-built populous town, situated in the bay of Bengal, in about the sixteenth degree of north latitude: it has one of the best havens in the country, and was a rich trading place before ships were sunk at the entrance of the harbour, in order to choak it up; and besides the whole country is ruined by the wars carried on between the kings of Pegu and Siam.

SECT. XII.

Of the Religion of the Siamese, containing a particular Account of the Convents of the Talapoins of both Sexes; the Rules of their Order, and Articles of their Belief.

IN the Siamese language a temple is called *pihan*; but the Portuguese, from the Persian word *Pouthgheda*, which signifies a Pagan temple, call both these and the idols themselves *pagodas* or *pagods*, and thus they are generally called by the Europeans in India.

Every Siamese temple is seated in the midst of a square piece of ground encompassed with pyramids, and inclosed by a wall. Without this wall is another square, which incloses the former, and round it are the cells of the priests and priestesses, which are frequently very numerous. Those cells, which the missionaries term a convent, are a number of single houses erected upon bamboo pillars at a small distance from each other, and the whole are inclosed with a fence of bamboo pales. The steeple of the pagoda is a wooden tower that stands by itself near the temple, and has a bell without a clapper, which instead of ringing they beat upon with wooden hammers. Of the splendor of these structures we have already given some account in treating of the city of Siam.

The talapoinesses or nuns are in the same convents with the men, but being never admitted till they are of an advanced age, there is not supposed to be any danger of a criminal correspondence. Indeed the constitution of a pagan convent seems in several respects preferable to those of the church of Rome; for in the first place neither sex is seized, and in a manner compelled to enter into a cloyster against their free consent; young women are not admitted into them at all, and liberty is given

to any person to return into the world, when they are tired of that state of life.

All the youth being educated by the talapoins, each of them has two or three nuns or pupils, who also serve him while they continue in the convent: there are others who do not go in for education, but live and grow old there in the character of a kind of lay-brothers. These weed the gardens, and perform other servile offices, which it would be criminal for the talapoin himself to execute. These nuns have a common room in the convent for their school, and there is another to which the people bring their alms on the days when the temple is shut, and here the talapoins assemble, and hold their conferences.

To every convent there is a head or master, who in some houses has greater privileges than in others, and are called *sancrats*: these have the sole power of admitting persons into the order of talapoins, and of giving them the habit; but they have no jurisdiction over any of the talapoins who do not belong to their respective convents. The king, however, gives a new name to some of the principal *sancrats*, on whom he also bestows an umbrella, a chair, and some slaves to carry it; though the *sancrats* never use them, but when they wait upon his majesty.

The talapoins are obliged to lead austere lives, by which it is supposed they atone for the sins of the laity. They live on alms, but must not eat in common; for every one lives upon what he himself procures by begging, yet they are very hospitable to strangers, and even to such Christians as come to their convents; and on each side their gate have lodgings for the accommodation of travellers.

Of these talapoins there are two sorts, one of the woods, the other of cities, the former lead much the severest lives. Both of them are, however, obliged to celibacy, on pain of being burnt, which the king takes care to have strictly executed; for they enjoy great privileges, and being exempted from the six months service, he takes care to see that they strictly observe the rules of their profession, and have their share of hardships, lest the greatest part of his subjects, tempted by the advantages they enjoy, should become talapoins, and be thus rendered of no use to the state. He therefore has them sometimes examined as to their skill in the Baly language, in which are written the precepts of their religion, and just before the arrival of the French ambassador at Siam, the king had dismissed some thousands of them for their ignorance; they being examined by one of his officers of state; but the talapoins of the woods refuse to submit to the examination of any one who is not of their order.

They not only educate children, but every new and full moon preach and explain the precepts of their religion to the people in their temples, and during the time of the inundation, they preach every day from six in the morning till noon, and from one in the afternoon till five in the evening. The preacher sits cross-legged on a couch or high bench, and when one is weary he is relieved by another, the people shewing their assent to the doctrine, by saying, "That is right, or fit to be done." After which they present their alms to the preacher, many of whom become very rich with the presents they receive from the people.

The Europeans call the time of the inundation the lent of the talapoins, for they eat nothing from noon, and when they do not fast they eat only fruit in the afternoon. It is pretended that some of the Indians will fast thirty or forty days without taking any thing besides some small liquors, in which a certain powder is infused: however, it is much easier to fast in a hot country than in a cold one, nor are the effects of an empty stomach so pernicious there as among us.

When the rice harvest is over the talapoins of the towns go every night for three weeks together to watch in the fields in small huts made of the branches and leaves of trees, and in the day-time live in their cells. They encamp in a square nearly in the same order with that in which their cells stand by the temples, and have the hut of their superior in the center. They do not like travellers, make fires in the night to frighten away wild beasts; for it is imagined that their sanctity is alone suf-

ficient to preserve them. Indeed they take care to pitch their tents at a distance from the woods where wild beasts chiefly haunt, and they who inhabit those dangerous places, make fires like other people to keep off the wild beasts; though the laity impute their safety to their great holiness. They imagine that a tyger will smell a sleeping talapoin, and only lick his hands and feet, and if they find the remains of one that has been killed, they either deny it to be a talapoin, or if that cannot be disputed, they pretend that he had transgressed the rules of his order; for they imagine that the very brutes can distinguish a saint from another man by the smell. Loubiere, however, observes, that their woods are not so dangerous as is imagined, since many families of the laity, as well as the talapoins, have been forced by the rigour of the government to take refuge in them.

These talapoins go bare-headed, and bare-foot, notwithstanding the heat of the sun; but have a yellow linen cloth thrown over their left shoulder, like a shoulder-belt, and over all a large yellow cloth, that has its name from the rags and patches of which it is composed. This hangs down both before and behind, and is girt about with a sash four or five inches broad. They shave the hair of their heads, beards, and eye-brows, and have a broad leaf, which serves them instead of a fan or umbrella. The superior is obliged to shave himself, because no person is worthy to touch his head; and, for the same reason, a young talapoin must never shave an old one, though an old one may shave him: but when a talapoin grows too old to handle the razor, which is there made of copper, another may supply that office, but then he must first ask a thousand pardons, and declare how unworthy he is of such an honour.

The talapoins wash themselves in the morning when they can but just discern the veins of their hands, and do not do it sooner for fear they should unknowingly drown some insect. They are no sooner dressed than they attend their superior to the temple, where they spend two hours in chanting their devotions. Their hymns, if we may be allowed to call them so, are engraved with an iron pencil in the Baly tongue, on long leaves, about two fingers broad, and several of these being tacked together at one end, make a book; but the people have no books of devotion and prayers. The talapoins, while they sing, keep time with their leaf, or fan, as if they were fanning themselves. Both the priests and people at their entering and leaving the temple prostrate themselves three times before the great idol with their heads to the ground.

At the new and full moons the people wash the talapoins; and in every private family the children, without regard to age or sex, wash both their father and mother, grandfather and grandmother naked.

The talapoins, after their morning's devotions, go into the city to beg, carrying with them an iron bowl in a linen bag, which they hang over their shoulders with a rope. They thus stand at the door of a house without asking any thing, but the people seldom let them go away empty handed. At their return to the temple they offer what they receive to the idol, and having then ate their breakfast, study till dinner, and sleep as is customary in hot countries. They afterwards instruct their pupils, and towards the evening, having swept and cleaned their temple, they spend two hours in singing their devotions, as in the morning, and then retire to rest, seldom eating any thing but a little fruit.

They never go out of their convents without prostrating themselves before their superior, and kissing his feet. Their convents have gardens belonging to them; they are also endowed with cultivated lands, and the talapoins have slaves to manure them. Besides these slaves they have, as hath been already observed, a kind of lay-brothers, who wear the same habit, only it is white, these receive the money given to the talapoins, it being a sin for them to touch any of it. These servants also look after their gardens and husbandry, and transact all such affairs as it is unlawful for a talapoin to be concerned in.

When a superior of a convent dies, another is elected by the society, on account of his age and learning. When a person erects a temple, he appoints the superior of the convent,

convent, but builds only a cell for him. The rest are afterwards erected, as other members are admitted. When a person desires admission, he first applies himself to the superior of the convent, but receives his habit from some *sacerat*: none are ever opposed in assuming the habit, that being esteemed highly criminal, and their parents are commonly so far from being against it, that they hire people to sing and dance before them, when they lead their sons to the convent to assume the habit; but neither the music nor the women must enter with them. The new elected talapoin has his head, beard, and eyebrows shaved, and the *sacerat* having pronounced some pious sentences on his devoting himself to religion, he is shut up in his cell, and is never to see a dance, or hear music more.

The talapoinesses, who are esteemed partly secular, and partly religious, may receive the habit from the superior of any convent, or even from the young pupils, without the consent of a *sacerat*, and if any of them are surprized with a man, they are not burnt as the talapoins are for entertaining a criminal commerce with women, but in this case are delivered to their relations to be bastinadoed; for the talapoins must not strike or chastise any person.

Though all the Indian priests believe the doctrine of the metempsychosis, or the transmigration of souls, yet in many other things they are not agreed. Some allow of marriage, others do not: some think it a sin to deprive any animal of life, other makes no scruple of it, and a third fort kill them only for sacrifice: some will eat any animal that dies of itself, or is ready killed to their hands, though they would no more put an animal to death than they would murder one of their own species.

The Indians believe that all nature is animated, and informed by a rational soul, and suppose the heavens, the earth, fire, water, rivers, woods, mountains, cities, and houses are animated by some spirit, or genius, and all of them firmly believe that each man has passed through innumerable states, and that every soul that possesses a human body, was confined to it in order to be punished for misdemeanors committed in some former life. This they infer from the observation, that the happiest mortal has his pains and disappointments; whence they conclude, that the highest felicity is found in a state of separation from the body: and the better to strengthen their opinion of the soul's pre-existence, some of the talapoins pretend to remember their several transmigrations. They also believe that the heavens, the earth, the plants, and every thing else have their period, and will be succeeded by new heavens and a new earth; and they do not even scruple to affirm that they have seen the decay and revival of all nature.

They imagine that the soul consists of matter so subtle, as to be free from touch, and yet that after death it retains the human form, with something analogous to the solid and liquid substances of which our bodies are composed, and that if a person dies by a wound he has received it may be seen in the aerial body, with the blood flowing from it; but though the soul be in their opinion material, they will not allow that it is perishable, but that it animates some other creature, and is sensible of pleasure and pain, and that it will at length re-enter an human body in a situation suitable to the behaviour of the soul in its several transmigrations.

They not only maintain that departed souls successively animate plants and animals; but believe that there are certain places beyond the visible world where they shall be rewarded or punished: that the happy shall ascend far above the stars, while the miserable shall be doomed to dwell as far beneath them. They usually assign nine different regions, both of happiness and misery, each differing in degree, the highest and lowest being most exquisite in their kind; and as they do not imagine that souls pass immediately from one state to another, but are new born into whatever place they happen to go, so they are persuaded that they shall want the same things as in this life, and therefore in some places burn their most valuable moveables, and even animals and slaves with them.

As the Siamese imagine that they can contribute to the relief of the deceased by thus supplying their wants, so they also believe that the dead are capable of doing them good or hurt, and accordingly pray to their departed friends, and do them all the honour they possibly can at their funerals, especially to the spirits of their ancestors, as high as their great grandfathers, imagining, that those beyond them have suffered for many transmigrations, that they can hear them no more.

They are not allowed to kill, to steal, to commit uncleanness, to lie, or to drink intoxicating liquors: the first precept they extend so far, that they think it criminal not only to kill men and animals, but even vegetables, and therefore do not destroy the seed of any plant; but as the fruit does not affect the life, they think themselves at liberty to eat it, but always preserve the stone or kernel; nor will they eat the fruit before it is ripe, because then the seed would never come to maturity. As they think every thing animated they will not cut down a tree, or break off the branches, lest they should dispossess a soul of its habitation; but when it is cut down, or a beast be killed, they make no scruple of using the one or eating the other, because they imagine no mischief can proceed from it.

As they imagine the soul resides in the blood, they think it unlawful to open a vein, or to make any incision by which the blood may be spilt; and some carry this scruple so far, that they will not wound a plant to let out its juices.

The Siamese, however, have ways to evade most of the precepts enjoined by their religion: thus they say, that in war they are not the occasion of the death of an enemy, but their enemies themselves in advancing upon their shot; for, as hath been observed, they always shoot something short of them. When the talapoins eat rice, which is a seed, they do not boil it themselves; but allow their servants to boil it, and kill the seed; and then they think they may eat it without being guilty of any crime.

The talapoins are not permitted to hear music, or to see plays or dancing; they must use no perfumes, nor must they touch gold or silver, or meddle with any thing that has not an immediate relation to religion. A talapoin must never borrow of a layman, or contract a friendship with him in hopes of receiving presents; he must not lend upon usury, nor must he judge or censure his neighbours: he must neither buy nor sell, nor must he set by what he begs one day for the next, but give what he does not eat to some animal. He may not look upon a woman with complacency, speak to one in private, or sit near her; nor must he receive any thing from the hand of a woman, and therefore she lays down her alms for the talapoin to take up. He is not to enjoy the indulgence of riding in a palanquin, or upon an elephant, or a horse; nor must he wear rich cloaths, or any colour but yellow; nor eat in gold or silver. If he laughs aloud, if he boasts of his descent or learning, or visits any but his father, mother, brothers, or sisters, they esteem it criminal. He is not to be angry; he must not return railing for railing, nor threaten any man; but must behave with the greatest decorum and modesty, and in his dress be distinguished by his neatness.

It has been observed, that the Siamese think there are nine degrees of happiness or misery to which departed souls may pass; but in all these states they imagine that they are born and die, they not being yet arrived at their ultimate happiness: but after several transmigrations, in which a soul has performed a multitude of good works, they believe that it shall be at length exalted to an unchangeable state of felicity, and, being exempted from future transmigrations, shall enjoy eternal rest. This is properly the heaven of the Indians; but they do not imagine that any souls will be eternally punished in the dismal abodes appointed for the evil genii; but suppose that if the soul be never sufficiently purified, it will be destined to an eternal transmigration.

When a person has merited this state of endless felicity, they attribute to him invincible strength of body, a perfect skill in all sciences, and think he will become a most perfect preacher of righteousness; after which they say
he

he is taken out of their sight, like a spark that is lost in air; and to the memory of these imaginary perfect men they dedicate their temples. But the person who they suppose has surpassed all the men that ever lived in holiness, and whom they therefore worship with the highest devotion, is Sommona Codom. Sommona signifies a talapoin of the woods, and Codom is his proper name. The books of the talapoins say, that he was the son of the king of Ceylon, and not only bestowed all his estate in charity, but pulling out his eyes, and killing his wife and children, gave them to the talapoins for food. They also imagine, that before his entrance into the state of bliss, he acquired a prodigious strength of body, and had the power of working miracles, being able to enlarge his body to what size he pleased, and then reduce it to so small a point as to become invisible. They say he had two principal disciples, whose images they place behind his on their altars; these are of a much inferior size; he that is placed on his right hand is called Pra Mogla, and he on his left Pra Scarabout; and behind them, on the same altar, they place other images, representing the officers of Sommona Codom's palace. They pretend that Pra Mogla, at the desire of the evil genii, overturned the earth, and took hell-fire into the hollow of his hand, in order to extinguish it; but finding it out of his power, he prayed to Sommona Codom to put it out; but he denied him, from the apprehension that mankind would abound in wickedness if the dread of this punishment was removed.

It is remarkable that whatever power they prescribe to Sommona Codom, they imagine he exercises it only over the Siamese, without interfering with the concerns of other nations, and that every kingdom has its peculiar deity. It is also observable, that they do not consider Sommona Codom as the person who first instituted their religion, but that he restored it after mankind had forsaken those rules which were originally enjoined them.

One of the most extraordinary particulars of the religion of the Siamese is their believing that all religions are good; and that though they are extremely tenacious of the principles of their own, they allow an unbounded indulgence to others: but of this spirit of toleration we shall give a more full and particular account in treating of the Gentoos of India.

We shall conclude this section with observing, that how extravagant soever the doctrine of the transmigration of souls may appear, it is attended with several consequences favourable to the cause of virtue. The prohibition of eating animal food is in that climate wholesome advice, and its creating a horror at the sight of blood makes them tender of shedding it. The assurance that they shall some time revive in a happier state is a great support to the Indians under any calamity, and lessens the dread of their dissolution; hence the eunuchs, who there consider themselves as the most unhappy of mankind, are extremely fond of this doctrine.

S E C T. XII.

Of the Trade of Siam in general; now engrossed by the King. An Account of the English Settlement at Merjee, and the Trade carried on by the Dutch at Siam. The Skill of the Siamese in mechanic Arts, and of the Coins, Weights, and Measures of Siam.

THE liberty of commerce which was formerly granted to Siam invited great numbers of foreigners to settle among them; every nation was possessed of a different quarter of the city, and had a chief or consul of their own choosing, and a person appointed by the king to transact affairs with him; but nothing of consequence was determined without the prime minister. The Mahometans of the Mogul's dominions had formerly the best establishment here, one of the ministers being of that religion: the principal offices and governments were in their hands, and the king caused several mosques to be erected at his own expence: the Siamese who embraced the religion of Mahomet were also exempted from the six months personal service; but this minister falling into disgrace, the credit of those of his religion sunk with

him, and all Mahometans were turned out of their employments; but they are still allowed their mosques and the exercise of their religion. It is computed that there are now about four thousand Mahometans at Siam, and as many Indian Portuguese, or of the mixed breed, which are very numerous on all the Indian coasts. The number of the Chinese are at least equal to the others, and there are about as many Malaysians: besides, there are some of other nations; but since the king has engrossed the foreign trade, the richest merchants have retired from Siam.

Most part of the trade of Siam is engrossed by the king, who even descends so low as to sell goods by retail in shops by his factors. Thus he sells to his subjects all their cotton cloths, which is the common wear of the people. He claims all the ore in the mines, and sells it to foreigners. His subjects are obliged to sell him all their ivory and arrack, which he likewise disposes of to foreigners. Sapan-wood, lead, and salt-petre, also belong to him; and sulphur, gun-powder, and arms can only be had at the king's magazines. He sometimes agrees with the Dutch to sell them all the skins and furs the country affords at a set price, upon which his subjects are obliged to sell to him first; but ambergris, brown sugar, and sugar-candy the merchants may, without restraint, purchase of his subjects.

Formerly a thousand vessels, at least, annually traded to Siam, yet there are now hardly any besides a few Dutch barks, for none care to deal with the king, who will make his own terms; and as the produce of the country is not very considerable, and foreigners are not allowed the liberty of trading either with one another, or with the natives, till the king has had the preference of all the best merchandize, it is not very advantageous trading thither.

At Merjee, a town situated on the banks of the Tenacerian, in the dominions of the king of Siam, were formerly settled a considerable number of English free merchants. This place enjoys a good harbour, and the adjacent country produces rice, timber for building, tin, and elephants teeth, in which the above merchants drove a considerable commerce, till they were ordered from thence by the old East India company, who threatened the king of Siam with a war if he continued to harbour them. One Weldon was dispatched to Merjee with this message, who added the outrageous murder of some of the Siamese to the insolence with which he provoked the government. The people resolving to be revenged for this barbarity, lay in wait for Weldon by night when he was ashore. But he receiving notice of their design made his escape on board his ship; and the Siamese missing him, vented their fury upon all the Englishmen, without exception, that fell into their hands. Seventy-six were massacred in this manner, and scarce twenty escaped to the ship. Till this time the English had been greatly cherished by the Siamese, and promoted to places of the highest trust in the government; one was advanced to be head of the customs at Tenacerian and Merjee, and another promoted to the rank of admiral of the royal navy; but a great revolution which fell out at this time in the Siamese state, and the jealousies of the English company, caused most of the English merchants to disperse, some to Fort St. George, others to Bengal, and others to Achen.

The Dutch company carry on a considerable trade here in tin, lead, elephants teeth, gum-lack, and deer skins. They have a factory about a mile below the city of Siam on the side of the river: the factor's house is extremely large, beautiful, and strong; the lodging-rooms are stately, and the warehouses spacious, and stored with all sorts of commodities. It was first built in the year 1634, and is moated round. Maillet observes, that it is one of the finest houses belonging to the Dutch East India company in these parts.

Here are no particular handicraft trades, but every man understands something of all; for as the king employs half his subjects in any business indifferently for six months in the year, should any person be perfectly ignorant of what he is set about, he would suffer the bastinado. On the other hand, none strive to excel, for fear of being retained in the king's service as long as he lives.

lives. The most dreadful discouragement to all industry is the tyranny of the government, which will not permit a man to enjoy a fortune, should he be able to acquire it; for whenever he is thought to be rich, his effects are seized.

The Siamese are however indifferent carpenters; they know how to burn bricks and make the hardest cements, and are not unskilful in masonry. They are skilled in casting metals, and in covering their idols, which are monstrous masses of brick and lime, with plates of gold, silver, and copper: they also cover the hilts of swords and daggers, and some of the king's moveables, with these metals, and can gild a vessel tolerably well.

The people here are but very bad forgers and only make use of cast iron. Their hories are never shod, and have but poor saddles and furniture; for they have not the art of tanning leather. They make a little ordinary cloth, but no kinds of stuffs, either of wool or silk; and yet they embroider very well. They have an extravagant method of painting, and, like the Chinese, represent animals that never had any existence, and give men the most absurd and hideous proportions.

The most common employment of the people is fishing, and those who have money follow merchandize; but the simplicity of manners, and neglect of superfluities that appear very remarkably in the Siamese, restrain them from following several mechanic arts and employments in which the Europeans busy themselves.

Their retail traders in shops and markets are so distinguished by their honesty, that the seller hardly counts the money he receives, or the buyer the goods he purchases by tale; and when they observe the European buy every trifle with caution, they laugh at their superabundant care.

Their markets begin at five in the evening, and last till eight or nine at night.

They have but one sort of silver coin, called a tycal; these are all made in the same form, and have the same impressions, but some are less than others; they are of the figure of a cylinder, and have a stamp on each side, with odd characters, which none of our travellers have been able to explain. Those on one side are included in a ring, and those on the other in the figure of a heart. The tycal is worth three shillings and three half-pence. They have no gold or copper money, the former is reckoned among their merchantable commodities, and is twelve times the value of silver.

The shells called cowries, or what we call black-moors teeth, serve to purchase little matters, and differ in their price according as they are more or less plentiful; but their value at Siam is generally eight hundred for a penny. They buy muslin and linen by the piece, and none but those who are very poor buy it by the ken or cubit. They have, however, a fathom, which they use in building, and in measuring their roads and canals; and their roads are marked with a stone at the end of every mile.

For grain and liquors they use the shell of the cocoa-nut, and as these are very unequal, they measure their capacity by the number of cowries they contain. They have likewise a kind of wicker measure, called a sat, with which they measure corn, and a pitcher for liquids; but there being no standard for them, the buyer sometimes measures their capacity by his cocoa-shells. Their weights are no more certain than their measures; for these are usually pieces of money, which are often light.

C H A P. XX.

Of the Peninsula of M A L A C C A.

S E C T. I.

Of the Situation and Extent of the Peninsula, and of the Vegetables and Animals of the Kingdom of Malacca, with some Account of its Inhabitants.

THIS peninsula some authors suppose to have been formerly joined to the island of Sumatra, and to be the Aurea Chersonesus of Ptolomy. It is bounded on the north by the kingdom of Siam Proper, which extends into the peninsula, the southern part being subject to the king of Siam; on the west by the straits of its own name, which divide it from Sumatra; and on the east and south by the Indian sea. It extends from about the second to about the eleventh degree of north latitude, and is supposed to be about four hundred and sixty miles from the north-west to the south-east.

The peninsula of Malacca is divided into several petty kingdoms, some of which are tributary to the king of Siam, and others are independent states.

The above kingdoms, which are so diminutive as scarcely to deserve the name, are Malacca, Johore, Singapour, Patana, Pahan, Tringano, Pera, Queda, and Ligor. We shall begin with the kingdom of Malacca, which gives name to the peninsula, and is situated on its southern extremity.

The coasts of the kingdom of Malacca are flat, marshy, and unwholesome; and the inland part of the country is covered with mountains and deserts that produce nothing for exportation but elephants teeth, a little tin, and few necessaries for the subsistence of the inhabitants, except what is planted in the gardens, and some rice and peas among the mountains. The people are, however, daily supplied with provisions from Sumatra and Bengal; and

all the wheat is brought from Java, Cambodia, and Siam.

Besides the fruits common in India, they have the mangostane, a delicious fruit nearly resembling an apple; the rind is thick and red, and when dried is a good astringent; its kernels resemble cloves of garlic, and are of an agreeable taste, but very cold.

The ramboflan is about the size of a walnut, and has a tough skin beset with capillaments, within which is a very agreeable pulp.

The durian is also an excellent fruit; for though it has a disagreeable smell, it is grateful to the palate: the rind is thick and yellow, and its pulp resembles thick cream, but is more delicious. It is esteemed hot and nourishing to such a degree as to be esteemed a provocative, and, instead of causing a surfeit, it fortifies the stomach.

Here is also plenty of cocoas, oranges, lemons, limes, sugar-canes, and mangoes, particularly a species of the latter called by the Dutch a stinker, from its being very offensive to the smell and taste. Here is a tree called the mourning-tree, because its flowers close in the night. The pine apples of this country are esteemed the best in the world, and are besides not so apt to give a surfeit as others. There is also plenty of aloes, and a few cinnamon-trees; but they are inferior to those of Ceylon.

There are here tygers, elephants, wild boars, and plenty of swine; but the other cattle are few, and being generally lean, they are supplied from other countries. They have wild and tame fowl, several sorts of game, and plenty of fish.

The inhabitants both of the kingdom and peninsula of Malacca are called Malayans, and are very tawny. The men go naked, except wearing a piece of stuff round their

their waist, to hide what modesty teaches them to conceal, and yet they adorn themselves with gold, bracelets and ear-rings, set with precious stones. The women wear silk skirts, which are sometimes embroidered with gold; and have long hair, which they anoint with the oil of the cocoa-nuts, and adorn with jewels. They are extremely proud, and demand more respect than other Indian women, yet are said to be very wanton.

Some authors say, there is a people here who sleep most part of the day, and do all their business by night. These resemble the Europeans, both in their shape and complexion. Their hair is of a yellowish colour, and their feet turn inwards. These are probably the inland inhabitants, called by captain Hamilton the Monocaboes, which are much whiter than the Malaysans of the lowlands, and are esteemed a savage and barbarous people: their greatest pleasure is said to consist in doing mischief to their neighbours; for which reason the peasants about the city of Malacca sow all their grain in gardens, inclosed with hedges, and deep ditches.

The Malayan language is esteemed the finest in all the Indies, where it is at least as common as the French in Europe. It is very easily acquired, because it has no inflections either in the nouns or the verbs. This renders the Malaysans well known in the East, though their country is only rich on account of their commerce with the Chinese. A dictionary of this language has been published in London by captain Bowry.

S E C T. II.

Of the City of Malacca; its being taken by the Portuguese, and the Manner in which the Dutch made themselves Masters of it. A Description of the City, and its Inhabitants.

THE city of Malacca is situated at the bottom of a bay, where the streights of Malacca are not above three leagues broad; and though the opposite shore of Sumatra be very low, it may be seen from thence in a clear day; the sea which separates that island being generally as calm as a pond, except when ruffled with squalls of wind, which are generally very violent, but not lasting. It is situated in two degrees thirty minutes north latitude, and one hundred degrees east longitude from London; and, according to Martiniere, is three hundred and forty Spanish leagues from Ceylon, three hundred and eighty from China, and one hundred and fifty from Achen. It received its name from a fugitive prince, who, after being expelled by the kings of Sincapora and Siam, put himself at the head of the Saletes who lived by fishing on the coast, and the Malaysans who inhabited the mountains; and, by their assistance, planted a colony here, to which he gave the name of Malakka, which signifies the wanderer.

According to Nieuhoff it was founded about two hundred and fifty years before the arrival of the Portuguese, who discovered this country in 1509, and in 1511 Alphonso Albuquerque made himself master of the city, after a brave resistance, and plundered it of effects to the value of one million two hundred and fifty thousand pieces of eight; and, not contented with this booty, had the cruelty to put the king to death. This was so resented by the king of Siam, and the other neighbouring princes, that they afterwards took the city by storm, but suffered the Portuguese to escape by sea. They, however, afterwards retook it, and built the castle, with three churches and a chapel within the fort, and one without; a considerable number of monasteries, and a noble college for the jesuits: and in their time the inhabitants were said to amount to twelve thousand, including the places under the jurisdiction of the city. In 1606 the Dutch, supported by the forces of the king of Johore, began to disturb the Portuguese in their possession; and, after thirty-five years of continual hostilities, took it from them in 1641. But as the manner in which they obtained the possession of this city was somewhat extraordinary, it will be proper to give a particular account of this event.

The Dutch, being informed that great disputes had arisen between the Portuguese inhabitants and the king of Johore, immediately conceived hopes of reducing it. For this purpose they fitted out a strong fleet at Batavia, for the streights of Malacca, with a considerable body of land-forces on board, and struck up an alliance with the king of Johore, offensive and defensive, as long as the sun and moon gave light to the world; on which that prince laid siege to the fort by land with twenty thousand men, while the Dutch blocked it up by sea; but finding that they were unable to take it by force, and that reducing it by famine would take up considerable time, they had recourse to fraud. Hearing that the governor was a fordid avaricious fellow, and much hated by the garrison, the Dutch, by secret conveyance, tampered with him by letters; offering him great wealth, on condition of his contributing towards the reduction of the fort. At length the price was fixed; eighty thousand pieces of eight were to be the reward of his treachery; he was to be safely carried to Batavia in their fleet, and be made a free denizen of that city. Upon this he sent secret instructions to the Dutch to make an attack upon the east side of the fort, and then calling a council, declared he had a mind to circumvent the Dutch by suffering them to come close to the walls of the fort, and then to fire briskly on them from all quarters, and destroy them at once. Accordingly the Dutch made their approaches without molestation, and even placed their ladders. The garrison sent message after message, to let the governor know the danger they were in for want of orders to fire, and to make a sally as was agreed in council; but he delayed till the Dutch, getting into the fort, drove the guard from the east gate, and, opening it, received the rest of their army; who were no sooner entered, than they gave no quarter to any that were in arms, and marching towards the governor's house, where he thought himself secure by the treaty, they basely murdered him to save the eighty thousand pieces of eight.

The city of Malacca is large, populous, and encompassed with a stone wall and bastions; the houses are close built, and several of the streets are handsome, spacious, and planted with trees on both sides. Some of the houses are of stone, but they are principally built of bamboos. The Dutch have demolished the noble college which belonged to the jesuits, but have preserved the church belonging to it for the exercise of their religion: this being placed on the top of a hill may be seen up or down the streights at a good distance, and a flag-staff is placed on the steeple, on which a flag is hoisted on the appearance of any ship. Another of the churches, which had the name of Misericordia, they converted into a magazine. Near the church on which the flag is fixed is a fort, which commands both the town and road, and is commonly garrisoned by two hundred Europeans. The only passage to it is by a draw-bridge. It is both large and strong, one-third of its walls being washed by the sea, and the rest secured by the river, which runs through a deep ditch. The house of the governor is both beautiful and convenient; and there are several other good houses both in the fort and in the city. The harbour being one of the best in that part of the world, on account of its being safe in all seasons, is frequented by vessels from most parts of the Indies. While it was in the possession of the Portuguese, it was, next to Ormus and Goa, the richest city in the Indies, and a place of rendezvous for their ships from China, Japan, the Spice Islands, &c. as well as a great mart for gold and precious stones. Before the Dutch made Batavia the emporium of their trade, it was the staple of these parts for all the rich commodities of Coromandel, Pegu, Siam, Banda, the Moluccas, and all the neighbouring countries and islands, and was therefore frequented by vast numbers of foreign merchants: but now it has no great trade; yet Mr. Lockyer says, they have two or three ships a year from the English settlements on the coast and bay of Bengal with opium, slight silks, calicoes, &c. which they sell here and make profitable returns in long-pepper, benjamin, canes, rattans, and gold, which last is had here at reasonable

able rates; but this trade is carried on by the connivance of the governor, council, and fiscal, whose business it is to prevent it: however, the ordinary charges of the fort and garrison are said to be equal to the profits made here by the Dutch.

The other inhabitants are the Chinese, Moors, Portuguese, and a few Americans. The best shops are those of the Chinese; these are well stocked with the produce of their own country: there are three or four great Mahometan merchants; but the natives live very meanly in the suburbs. They resemble those of Achen, and are very negligent in their affairs. The river is very broad, and at high water is brackish; but is fresh at low-water, when the shore is so muddy that there is no landing. The inhabitants have store of fowl, fish, fruit, and roots, but there is little pasturage.

SECT. III.

Of the Kingdom of JOHORE.

Its Situation, Extent, and Produce. Its Inhabitants, and an Account of Johore Lami, the Capital. Of the Town and Island of Sincapora, and the Johore Islands.

THE next country to the north of Malacca is the territory of the king of Johore, which is washed both on the east and west by the Indian ocean, and is about eighty leagues broad and one hundred in length, from the town of Pera on the north to Point Romano, the southern cape of all the continent of Asia, it being situated in one degree north latitude.

This is a very woody country, and has plenty of lemons, very large citrons, pepper, and the other common fruits of the Indies; it has also aquila-wood and canes: the country likewise produces gold, tin, and elephants teeth; and among the cattle are buffaloes, wild boars, cows, and deer.

The common people wear only a piece of stuff hanging down before, but those in better circumstances have calicoe shifts, with a silk head-band and girdle, and by their sides have poniards adorned with precious stones. They paint their nails yellow, and those of the greatest quality wear them longest.

The people who inhabit the inland part of the country live chiefly on sago, on fruits that are ripe at all seasons of the year, on roots of which they have great plenty, and on poultry. But those who live on the sea-coast feed chiefly upon fish and rice brought thither from Siam, Cambodia, and Java.

They are said to be naturally brave, but lascivious and proud; the only people among them remarkable for their industry are the Chinese, who reside in their great towns, of whom there are supposed to be about one thousand families settled in the Johore dominions, besides a much greater number who carry on a foreign trade with them.

The capital of this kingdom, which is called Johore Lami, is situated on a river twenty-one leagues south of Malacca. This was a considerable city before it was destroyed by the Portuguese in 1603, when the king, being driven from it, built another city in 1609 higher up the river, which he called Batufabar, and to which the Dutch contributed out of the spoils they had taken from the Portuguese on their driving them out of the country. At the entrance of the river are two islands in the form of sugar-loaves. The town is divided into two parts, the one thirteen hundred paces and the other five hundred in compass, and contains about four thousand fighting men. The houses, which are built along the bank of the river, are of free-stone, raised on piles eight or ten feet high, and have a noble appearance.

The natives are a mixture of Pagans and Mahometans, who are supplied with priests from Surat. Their money is a gold coin, called macy, worth about three shillings and six-pence sterling, and a coupang, which is one quarter of a macy.

The town and island of Sincapour, or Singapore, are situated at the southernmost point of the peninsula, and give name to the south-east part of the straits of Malacca. Nieuhoff says, that it is twenty leagues, but

others say that it is a hundred miles to the south-east of Malacca. Before the building of this last city Sincapour had a king of its own: it was then the principal trading town on the coast, on account of its lying in the center of trade, and its having good rivers and safe harbours, so conveniently situated, that all winds serve shipping to come in and go out of them. It has a mountain of the same name, which produces excellent diamonds. The soil of this country is black and fat, and the woods abound in timber fit for masts and for building. Large beans grow wild, and are not inferior to the best in Europe; as do also sugar-canes of a prodigious size.

To the north east of Cape Romano lie the Johore islands, which are the principal of those on the eastern coast: these are Pulo-Tingi, Pulo-Aure, Pulo-Pisang, Pulo-Timoun, and Linga; which last, Nieuhoff says, abounds with sago, but has no rice, and has about three thousand inhabitants: and all these islands in general produce goats, poultry, and some fruit; but no commodities proper for exportation.

Pulo-Aure, or the island of Aure, is inhabited by Malaysians, who profess the religion of Mahomet, and are said to form a kind of republic, at the head of which is a captain, or leader, of their own choosing. The island abounds with refreshments of every kind, and chiefly consists of five or six mountains, in which are many plantations of cocoa-trees. It is extremely populous; settlements are dispersed through the country; but the married women and maids are never seen abroad. Commodities are here not purchased with money, but with iron, with which the inhabitants make military weapons; and more especially tools for building houses, and tilling the ground. They have canoes formed only of three pieces of wood, and have the character of being an humane, friendly, and sincere people, remarkable for their honesty.

Pulo-Timoun, or Timon, borders on the country of Pahan, and is the safest as well as the largest and highest of all the Johore islands; it is extremely pleasant, its mountains being covered with trees, and its valleys watered with clear streams. It produces the best betel; of which the Javans fetch great quantities.

Pulo-Pisang, or the island of Pisang, is three leagues south-east from Timoun, and has a town of the same name, where there is good anchoring. The island is well supplied with refreshments and good water.

SECT. IV.

Of PATANA.

Its Situation, Extent, and Produce. Its Capital of the same Name described, and the Manners of the Inhabitants. The Power of the King, and the Trade carried on there.

PATANA is situated on the eastern coast of the gulph of Siam, and had once an English and Dutch factory. It abounds with wild buffaloes, and is about sixty leagues in length. It is governed by its own magistrates, yet pays the king of Siam a kind of annual homage by presenting him a gold flower worth fifty crowns. The port, which is about two leagues from the town, had formerly a very great trade; it being the staple for Surat shipping, and carrying on a considerable commerce from Goa, Malabar, Coromandel, China, Tonquin, Cambodia, and Siam; but the merchants, finding that robbers and murderers were under no restraint, turned their trade into another channel, which was of singular advantage to Batavia, Siam, and Malacca.

Patana abounds with all the grain and fruits of the Indies, besides some transplanted from China, and each month has its peculiar fruit.

Here are tygers, elephants, apes, wild boars, and other wild and tame beasts, fowls, ducks, and beautiful turtle-doves that have as fine colours as the peacock: they have plenty of turtle, oysters, and craw-fish. The apes and wild boars do incredible mischief to the fields; the inhabitants therefore kill as many of the latter as they can; but, as they eat no swine's flesh, they bury the carcasses.

The

The town, which is encompassed on the land side by bogs, is about half a league in length, but is narrow and fortified with wooden palisadoes as tall as the main-mast of a ship. The houses are built of cane and wood. The suburbs, which are also long and narrow, are watered by a fine stream, and here the king has a palace inclosed with palisadoes. In this town the Mahometans have stately mosques, and the Gentoos several temples.

The inhabitants of this city are of a swarthy complexion, well shaped, proud, but obliging to their friends; but they have an aversion to wine and strong drink. They have as many wives and concubines as they can maintain, and let out their daughters and female slaves to foreigners for so much a month; and by this infamous commerce the nobility make great profit.

According to Nieuhoff, the king is able to bring eighteen thousand men into the field: This country has more ships than any of the neighbouring nations. The Chinese are the chief manufacturers and traders: they bring here porcelain, stoves, kettles, lock-smith's-ware, dry and salt-fish, calicoes, &c. in return for which they receive several sorts of wood, cordage made of coconut-shells; the skins of buffaloes, oxen, rabbits, and hares; cocoa-nut oil, rice, green-pease, several sorts of fruit, and edible birds-nests.

SECT. V.

Of the Kingdoms of PAHAN and TRANGANO.

Their Situation and Produce. The Capitals of those Countries described.

PAHAN, which is situated one hundred and fifty miles north-east of Malacca, is the capital of a kingdom to the south of Patana, situated twelve miles up a river of the same name, which has a pretty large island at its mouth that divides it into two channels. This river is a mile broad, but so full of shoals that it is difficult, even at high water, for a ship of thirty tons burthen to get up to the town. This river, in which there is abundance of gold-dust, washes the foot of Malacca-hill, and along the sides of it pepper is planted, for exportation. The country on its banks is low, woody, and stored with wild game and fruits, and in the river and the sea are excellent fish, but the air is not reckoned very healthful.

The nobility alone live in the city of Pahan, and the common people in the suburbs; the city is therefore very small, and is surrounded with a fence formed of the trunks of trees joined together about four fathoms high, and has a bastion at each corner; the streets, being hedged in with reeds, and planted with cocoas and other trees, resemble so many gardens. The houses are generally built of reeds and straw, but the king's palace is of wood.

Captain Hamilton informs us, that the king earnestly expressed his desire that the English would settle there; and told him, that Pahan might be made a place of great trade, were there shipping to carry off the pepper and tin which his country could furnish; adding, that one hundred and fifty men would be sufficient to curb his own rebellious subjects and their allies the Bougies; but that none in that country ever put themselves under the protection of the Dutch, who would not be glad to shake it off again.

The next country to this is Trangano, which is extremely pleasant and healthful, and affords a fine landscape from the sea. The hills, which gently rise, and are of a moderate height, are covered with ever-greens that bear a variety of delicious fruits, as durions, oranges, lemons, limes, mangoostans, rambostans, mangoes, and letchees; and in the valleys are corn, pulse, and sugar-canes; but the Malaysians, being too lazy to cultivate the earth, this is performed by the Chinese. The country also produces pepper and gold, which are chiefly exported by the Chinese.

The finest fish come from the neighbouring seas into its river, and are caught in the months of July and

August: but from October to March the river is shut up by a bar formed by the impetuosity of the great seas, which the north-east monsoons produce near that shore. Their poultry are large, plump, and sweet; but beef is scarce, except that of the buffalo, of which there is plenty.

The city of Trangano, in which the king of the country resides, is pleasantly situated on the side of the above-mentioned river near the sea. The houses, which amount to about a thousand, are not formed into regular streets, but scattered ten or twenty in a place at a small distance from each other, forming many separate villas. Above half of the inhabitants are Chinese, who trade to several of the neighbouring countries.

SECT. VI.

Of PERA, the Island PULODINGDING, QUEDA, and LIGOR. Their Situation, Produce, and the Manners of the Inhabitants.

PERA, or Perach, is situated at the bottom of a bay one hundred and fifty-four miles north-west of Malacca, in four degrees forty minutes north latitude, and one hundred and two degrees ten minutes east longitude from London, near a river that discharges itself into the straits of Malacca. This is the capital of a kingdom of the same name, and abounds with more tin than any country in India. It has very high mountains, thick woods, and frightful deserts, which abound with rhinoceroses, wild elephants, buffaloes, tigers, and serpents; and the rivers are infested by crocodiles. According to captain Hamilton this is properly a part of the kingdom of Johore; but the government, when he was there, was a kind of anarchy; and the people, who are Mahometans, are so untractable, treacherous, and barbarous, that no European nation can keep a factory there with safety, as the Dutch experienced when they settled a factory and erected a fort at Pulodinding, an island at the mouth of the river Pera, but were all cut off.

According to Dampier and Nieuhoff, this island is mountainous, and well supplied with springs of water. It has large timber, and trees proper for masts and sail-yards. These trees are tall, and have a red wood, valued for its beauty by the Indians, who make curious works of it. The island has several good bays, excellent water, and plenty of fowl and fish, particularly turtle, and a small sort of very good oysters, which often hang in clusters to the branches of trees that grow by the sides of the water. Here are likewise many wild boars, that swim hither from the neighbouring continent to feed on the roots; but the coast is infested with a venomous flat fish, called a sea-qualm, that is dangerous to those of the inhabitants who wash in the sea, by causing inflammations wherever they touch: they are about the size of a common plate; their flesh is soft like a jelly, on their backs are red and purple spots, and there are eight teats on their bellies.

Queda, or Keda, is a sea-port town, one hundred and thirty miles from Patana, on the west side of the Peninsula, and is the capital of a country which has also the title of a kingdom; but its territory is small, and the people poor. It is situated in a good soil, watered by several brooks that come from a navigable river, and abound with crocodiles. The poor, proud, and beggarly king, says captain Hamilton, never fails to visit foreign merchants as soon as they arrive in this port, and expects presents from them when they repay his visit; in return for which his majesty will honour the foreigners with a seat near his sacred person, and chewing a little betel put it out of his mouth on a little gold saucer, which his page hands to the foreigner, who must take it with all possible respect, and chew the royal morsel after him, for the refusal would be attended with danger.

Ligor, the capital of a country of the same name, is situated in one hundred degrees twenty-five minutes east longitude from London, and in eight degrees north latitude. It is subject to Siam. On the coast is a small island

island also called Ligor. The Dutch have a factory here that carries on a considerable trade in tin and pepper; the country producing abundance of the former, all of which they engross to themselves. The town,

which is situated about two miles above the factory, is built of bamboos and thatched with reeds, and has many Pagan temples with lofty and slender steeples.

CHAP. XXI.

Of the Empire of AVA, including PEGU, ARACAN, and TIPRA.

SECT. I.

Its Situation and Boundaries: the Manner in which Pegu was ruined and rendered subject to the King of Ava. A short Description of the Cities of Pegu and Syriam.

THE empire of Ava is placed by Monsieur de Lisle between the latitude of fifteen and twenty-eight degrees north, and is bounded by Tibet on the north, on the east by the kingdoms of Laos and Siam, on the west by Bengal and its gulph, and on the south by the Indian sea.

The greatest part of this territory was formerly possessed by the king of Pegu; but that monarchy has been destroyed by two powerful kings of Ava and Siam; the former of whom is absolute sovereign both of Ava and Pegu, and has several of the neighbouring states tributary to him.

Those who have travelled through the East give but little information about the kingdom of Ava, though they pretend it is twice as large as that of France. They only observe, that the immense riches of the king appear in the splendor of his palace, which, though of vast extent, is for the most part adorned with gilding.

Whatever is related by historians of the kingdom of Pegu is drawn from Gaspar Balbi, a rich Venetian merchant, who traded thither in 1576; and supposing him endowed with ever so great a portion of judgment and veracity, his account of that country can give but little idea of its present state: we shall therefore take our account of Pegu chiefly from captain Hamilton, who visited that kingdom, and became instructed in the manners of the people, partly by the inhabitants themselves, and partly by the informations he obtained from some of the English company at Fort St. George who traded thither. The cause which produced the ruin of the kingdom of Pegu, with Martavan, and some others under its dominion, was told to Mr. Hamilton by some Peguans, in several discourses he had with them on that subject.

A strict friendship for a long time subsisted between the kings and subjects of Pegu and Siam, who being next neighbours, carried on a great trade with each other, till the sixteenth century: but a Pegu vessel being at Siam, the metropolis of the kingdom, when ready to depart, anchored one evening near a small temple a few miles below the city, when the master and some of the crew going there to worship, saw a little well-carved image of the god Sanisay, and finding the talapoints negligent, stole that idol, and carried it to Pegu. Those priests missing the little idol, lamented their loss to all the neighbouring talapoints, and by their advice carried their complaints to the king of Siam; and there happening to be a scarcity of corn that year, the calamity was imputed by the priests to the loss of the god Sanisay. The king of Siam now sent an embassy to his brother of Pegu, desiring the restitution of the image, whose absence had been attended with such fatal consequences: but the king of Pegu refusing to comply with his request, a bloody war ensued between the two kingdoms, in which the king of Siam ravaged the country, and annexed the inland countries of Pegu to his own dominions.

The king of Pegu, in this distress, invited the Portuguese to his assistance, whose name began to be dread-

ed in India, and by the great encouragement he gave them, got about one thousand volunteers into his service: the use of fire-arms being then unknown in those parts, they spread terror wherever they came, and drove the Siamese out of the country. The king of Pegu then made one Thoma Pereyra, a Portuguese, general in chief of all his forces, and settled his court at Martavan, near the borders of Siam, to be ready on all occasions to repel the Siamese troops.

Though the Portuguese, by their insolence, now rendered themselves hated by people of all ranks, Thoma Pereyra was the favourite at court; he had elephants of state, and a guard of his own countrymen to attend him. One day, as he was coming with great state from the palace, riding on a large elephant, he chanced to hear music in a burgher's house, whose daughter, a very beautiful virgin, had been married to a young man of the neighbourhood. The general went to the house, wished them joy, and desired to see the bride. The parents took the general's visit for a great honour, and brought their daughter to the elephant's side, when being struck with her beauty, he had the villainy to order his guards to seize her, and carry her to his house.

The general's orders were but too readily obeyed, and the bridegroom not being able to endure his loss, cut his own throat; the disconsolate parents of their injured children, rent their cloaths, and ran towards the king's palace uttering their lamentations, and imploring their gods and countrymen to revenge them on the insolent Portuguese, the oppressors of their country. The streets were soon unable to contain the crowds with which they were filled, and the noise they made reaching the king's ear, he sent to know the cause of the tumult, and being informed, let the people know that he would punish the criminal. He accordingly sent for the general; but he being employed in ravishing the unhappy bride, excused himself, by pretending to be so much indisposed, as to be unable to wait on his majesty.

The king, exasperated at this answer, in the first transport of his rage, ordered the whole city to take arms, and make a general massacre of the Portuguese, wherever they could be found. And this cruel order was so speedily executed, that in a few hours all the Portuguese were slaughtered, except the criminal, who being taken alive, was made fast by the heels to an elephant's foot, and was thus dragged through the streets, till the flesh was torn from his bones. Three Portuguese alone were saved; these were accidentally in the suburbs near the river, and hiding themselves till night, made their escape in a small boat, and coasting along the shore, lived on what they found among the rocks, and in the woods, and at length arrived at Malacca.

Both these kingdoms being extremely weakened and exhausted by these wars, suspended all acts of hostility, till about the middle of the seventeenth century, when the king of Siam again invading Pegu, conquered several provinces tributary to that kingdom. The king of Pegu, now finding his forces unable to protect his more immediate dominions, called for the assistance of the king of Ava, whose dominions lay about five hundred miles up the river. He complied with the invitation, and drove the Siamese from their new conquests; but afterwards perceiving the want of discipline among the Peguan forces, he murdered the king, whom he came to protect; broke the Peguan army, and seized the kingdom of Pegu; and ruined its capital.

They

The ancient city of Pegu stands about forty miles to the eastward of Syriam, and was once the seat of many great and puissant monarchs, who made a distinguished figure in the east; but now its glory is laid in the dust; for not a twentieth part of it is inhabited, and its few inhabitants are of the lower class of the people. The ditches that surrounded the city, which are now dry, and bear good corn, shew that few cities in the world exceeded it in magnitude, for they are computed to be six or seven leagues round.

The city of Syriam is built on a rising ground near the side of Pegu river, about six leagues from the bar, and is encompassed with a wall formed of stone without mortar. The governor, who is generally a person of the royal blood, resides in it. The suburbs are however four times bigger than the city. It was many years in the possession of the Portuguese, till their intolerance and pride obliged the government to drive them from it.

S E C T. II.

Of the Produce of the Country; the Persons, Dress, Customs, and Manners of the Inhabitants; particularly the Form of Marrying a Pegu Woman to an European; the annual Ceremony of firing Sky-rockets of a prodigious Size: The Diseases to which the People are liable.

THIS country is very fruitful in corn, excellent pulse of several sorts, fruits and roots, and produces timber for building, elephants teeth, iron, said to be of so hard a nature as to be a kind of natural steel, tin, lead, oil of earth, wood oil, the best rubies in the world, small diamonds, amethysts, sapphires, and other precious stones; bees-wax, stick-lack, and abundance of saltpetre. Wild game of all sorts is extremely plentiful, and captain Hamilton says, that deer are so numerous, that he bought one for a groat; but though they are very fleshy they are not fat. They have swine's flesh, plenty of good poultry, and many sorts of excellent fish.

The Peguans suffer their hair to grow very long, and tie it on the top of their heads with a cotton ribbon wrapped round it in such a manner that it stands up in the form of a spire. They wear a garment so thin that the skin is easily seen through it, and have a large scarf about their loins, which reaches to their ancles, but they wear neither stockings nor shoes.

The natives of Ava are distinguished from the Peguans by making figures on their skins, by pricking them with a bodkin, and rubbing them over with charcoal. This the Peguans are not allowed to perform. The men are generally plump, well shaped, and have good features; but are of an olive complexion.

The women are much fairer than the men; they are also well shaped, and have commonly pretty round faces, but are small of stature. Their head-dress is their own black hair tied up behind, and when they go abroad they wear a piece of cotton cloth loose on the top of their heads. They wear a cotton or silk frock, which fits close to their bodies and arms, and reaches half way down the thigh; under it a scarf which comes four times round their waist, and hangs almost to the ancle, but is so contrived, that at every step they take it shews the right leg, and part of the thigh. This part of their dress is very ancient, and is said to have been first contrived by a queen of the country, who, grieved to see the men so addicted to an unnatural vice, as to neglect the ladies, contrived this habit to raise desire, and incite them to place their affections on proper objects. The queen had the pleasure of seeing, that this expedient had the desired effect, and now the odious vice of sodomy is hardly known in that country.

The women are extremely courteous and kind to strangers, and are particularly fond of marrying Europeans. Hence most of the foreigners who trade thither, marry one of these women, for the time they stay. After the parties are agreed, the bride's parents, or her nearest relations, invite the bride and bridegroom, with the friends of each to a feast, and when it is over, the father, or

bride-man, asks them both if they are willing to cohabit together as man and wife, and both giving their consent, they are declared lawfully married. If the bridegroom has a house, he conducts her thither; but if not, they have a bed provided in the house where they are married.

These women are obedient and obliging to these temporary husbands, and take the management of affairs within doors wholly into their own hands. The wife goes to market, buys and dresses the food, and takes care of her husband's cloaths, in washing and mending them. If he has goods to sell, she takes a shop, and sells them by retail, to a much better account than he could sell them to the merchants, and some of them take goods to the inland towns, where they exchange them for such as are proper for the foreign markets to which the husband is bound, and generally bring fair accounts of their proceedings. If she proves false to his bed, he may cut off her hair, sell her for a slave, and keep the money. On the contrary, if the man goes astray, the woman will be apt to poison him. If she proves prolific the children cannot be carried out of the kingdom without the king's permission, which, however, may be purchased for forty or fifty pounds; and, if any irreconcilable quarrel happens between them, the father must take care of the boys, and the mother of the girls. When the husband leaves the country he may continue the marriage, by allowing his wife six shillings and eight-pence a month, and if this be not done, she may marry again at the end of the year; but if she receives that sum on his account, she is obliged to stay three years. She is the better esteemed for having been married to several European husbands.

People of fortune annually let off sky-rockets in the month of September, and if they fly a very great height, it is considered as a certain sign that the owner is in favour with the gods, but if they fall to the ground, and spend their fire without rising, the owner is greatly afflicted, and believes that his deities are not his friends. The persons, whose rockets rise in the air, shew their gratitude by building temples, and dedicating them to the gods they adore, and the priests whose temples are decayed, bringing their idols to adorn the new raised structures, are rewarded with the benefice. Captain Hamilton asserts, that he saw some of these rockets so large, that one of them contained above five hundred pounds weight of powder, dust, and coals, of which they are commonly composed. The carcase is the trunk of a large tree made hollow, into which they ram the composition, and then bind the carcase with thongs made of buffaloes hides from one end to the other, to keep it from splitting. After securing the ends of the carcase, that the composition may come gradually out when fired, they place it on a branch of a large high tree, and having fixed it in a position for mounting, add a large bamboo for a tail to balance it, some of which are said to be one hundred and twenty feet long. When the tail is fixed on, the day of solemnity is proclaimed, and multitudes of people of all ranks and ages being assembled, the owner sets fire to it, and the rocket either mounts a prodigious height in the air, or flies five or six hundred paces in an irregular manner on the ground, scorching or wounding all in its way. Soon after they choose some women out of the people assembled to perform a dance to the gods of the earth. They have various kinds of instruments, but the tabor and pipe are esteemed the best: they have also an instrument shaped like a galley, about three feet long, with twenty bells of several sizes placed on the top, with which they make no bad music.

The distemper most dreaded in this country is the small-pox. When any one is seized with it, all the neighbourhood remove for three weeks to the distance of two or three miles, where they soon run up new houses made of bamboos, and leave the sick person to live or die by himself, with only a basket of rice, some earthen pots to boil it in, and a jar of water. If the patient lives they fetch him to their new habitations, of which they make him free. It is here said that the most ravenous tyger will not touch a person afflicted with this loathsome disease.

S E C T. III.

Of the Religion of the Peguans. A Description of their Temples and Images, and of the Funeral of an High Priest.

THE talapoins are such strict observers of all the rules of humanity and charity, that if a stranger has the misfortune to be shipwrecked on the coast, though he is by the laws of the country the king's slave, they prevail on the governors to evade the cruel law, and deliver them to their care. When any unfortunate strangers come to their temples, they are hospitably supplied with food and raiment; if they are sick or maimed, these priests, who are also the chief physicians of Pegu, keep them till they are cured, and then furnish them with letters of recommendation to the priests of another convent on the road they design to travel. They never enquire after the religion of a stranger; their humanity is too warm to permit them to confine their benevolence to those of their own profession; it is sufficient, that the stranger has the human form, and that renders him the object of their charity. In their opinion all religions are good that teach men to be good; they believe that the gods are pleased with various forms of worship, but with none that is hurtful to man, because cruelty is contrary to their nature.

When any contention happens between neighbours the talapoins use all their endeavours to produce a reconciliation, and never leave their good offices till they have obtained it; when, in token of friendship, the parties, according to an ancient custom, eat champoc from each other's hand to seal their friendship. This champoc is a kind of tea that has a very disagreeable taste: like other tea it grows on bushes, and is used on such occasions all over Pegu.

The talapoins frequently preach to numerous auditories, in which the usual subject of their discourses is, that charity is the most sublime of all the virtues, and ought to be extended not only to mankind, but to animals. They also exhort the people not to commit murder; to take from no person any thing belonging to him; to do no hurt; to give no offence; to avoid impurity and superstition; and above all not to worship evil spirits. But their discourses on this last point have no effect. The people attached to manichæism believe, that all good comes from God, and that the evil spirits are the authors of all the mischief that happens to man; and that therefore they ought to worship these demons that they may not afflict them. This is a common notion among the Indian idolaters.

The images in their temples are placed cross-legged under domes; their faces are longer than the human; their ears are very large, and the lobes are thick; their toes are all of an equal length, and their arms and hands are very small in proportion to their bodies. The congregation bow to them when they come in and go out, and that is all the worship they pay them.

There are two large temples near Syriam, which so nearly resemble each other, that they seem to be built on the same model. One of them, which stands about six miles to the southward, is called Kiakiack, or the temple of the god of gods, in which is an image twenty yards in length, lying in a sleeping posture, and they pretend that he has lain in that manner six thousand years. The doors and windows of this temple are always open, and every one is at liberty to see this idol. They are persuaded, that when it awakes the world will be destroyed. The temple is erected on an eminence, and in a clear day may easily be seen at six leagues distance.

The other temple, named Dagun, is situated in a low plain about the same distance, to the north of Syriam, but the doors and windows are always shut, and none are allowed to enter this temple but the priests, who will not describe the shape of this idol, though they say it does not resemble that of an human being. As soon as Kiakiack dissolves the frame of the world, Dagun, they imagine, will gather up the fragments, and form a

new one. Near these temples are held annual fairs, at which are made free-will offerings for the use of those temples.

According to Balbi, the Peguans in his time had annually five principal festivals, which they call Sapaus, and celebrate with extraordinary magnificence. In one of them the king and queen went in pilgrimage about twelve leagues from the city, on which occasion they rode on a triumphal car, so richly adorned with jewels, that it might be said, without an hyperbole, they carried about them the value of a kingdom. This prince was at that time extremely rich, and had in the chapel of his palace several idols of inestimable value. One of them, he says, was of the human form, as big as the life, and of massy gold, having on its head a triple crown, adorned with all sorts of precious stones; on the front was a ruby as big as a prune; at the ears were the richest pendants that ever were seen, and on the belly a scarf in the manner of a belt covered with diamonds and stones of an inestimable price. Two other idols of silver were by the sides of the first, but higher by two feet. A fourth idol passed for the richest of them all, both from the quantity of metal, and its ornaments; and a fifth was no less esteemed, though it was only made of brass and pewter.

Mr. Hamilton observes, that he saw the ceremony of an high-priest's funeral, and was not a little pleased with the solemnity. After the body had been kept three or four months from putrefaction by spirits or gums, a great mast was fixed firmly in the ground, and at fifty or sixty yards distance on each side were placed four smaller masts, all of them perpendicularly. Around the great mast in the middle three scaffolds were erected above each other, the lowermost the largest, and the smallest at the top, so that it resembled a pyramid. These scaffolds were railed in, except an open place of three or four feet on each side. All the scaffolds, and the ground below them, were filled with combustibles. Four ropes were carried very tight from the mast in the middle to the other four masts, and a rocket on each rope was placed at each of the small masts. The corpse was then carried to the upper story of the pyramid, and laid flat on the scaffold, and after a great shew of sorrow among the people who were present, a trumpet was sounded, at which signal fire was put to the rockets, which, with a quick motion, flew along the ropes, set fire to the combustibles, and in a moment they were in a flame, and in an hour or two all were consumed.

The people entertained such veneration for this talapoin, that they esteemed him a saint. He was highly respected by the king himself, and when any nobleman happened to incur the king's displeasure, he used his interest with his majesty to have him restored again to favour. This always happened, except the nobleman was guilty of atrocious crimes; and then he used his endeavours to have the rigour of his punishment abated.

S E C T. IV.

The absolute power of the King; the manner in which Traitors are punished. The fulsome Adulation with which he is treated by his Subjects. Of his Army, and the Maintenance of his Troops. The Forms observed in the Courts of Justice, and some Account of the Palace and City of Ava.

THE king is despotic, and all his commands are laws; he, however, holds the reins of government in his own hands, and punishes with the utmost severity those governors of provinces and towns whom he finds guilty of oppression. That he may be informed of every thing that passes throughout his dominions, every province or city has a deputy residing at court, which is generally in the city of Ava, the present metropolis. These deputies are obliged to attend the court every morning; and when the king has breakfasted he retires into a room where he can see all his attendants, without being seen: mean while a page waits to call the person from whom his majesty would obtain an account of whatever has passed in his province or city, and this news he relates, looking

looking with profound reverence towards the room where the king stays; but if he omits any thing of consequence, which the king happens to hear of by another hand, he is sure of being severely punished.

When his majesty receives information of treason, murder, or any other crimes, he causes the affair to be tried by judges of his own choosing; and, on the conviction of the criminal, assigns the punishment he is to undergo, which is either being beheaded, made sport for the elephants, which is the most cruel death, or banished for a time to the woods; whence, if he escapes being devoured by the wild beasts, he may return when his banishment is expired, and then must spend the remainder of his days in serving a tame elephant: but for smaller crimes people are only sentenced to clean the stables of the elephants.

The king is treated by his subjects with the most fulsome adulation. In speaking or writing to him they stile him their god; and in his letters to foreign princes, he assumes the title of king of kings, to whom all other sovereigns ought to be subject, as being the near kinsman and friend to all the gods in heaven and on the earth, by whose friendship to him all animals are fed and preserved, and the seasons of the year keep their regular course. The sun is his brother, and the moon and stars his relations; and he pretends to preside over the ebbing and flowing of the sea: but, after all these lofty hyperbolical epithets, he sinks so low as to call himself king of the white elephant, and of the twenty-four white umbrellas. When his majesty has dined a trumpet is blown, to signify to all the kings of the earth that they may go to dinner, because their lord hath already dined. And when any foreign ships arrive at Syriam, he is informed of the number of the people on board, with their age and sex, and told that so many of his slaves are arrived to partake of the glory and happiness of his reign.

When an ambassador is admitted to an audience he is attended by a considerable body of guards, with trumpets sounding, and heralds proclaiming the honour he is about to receive, in seeing his majesty's face, the glory of the earth; and between the gate and the head of the stairs that lead to the chamber of audience the ambassador is attended by the master of the ceremonies, who instructs him to kneel three times in the way thither, and to continue on his knees, with his hands over his head, till a proclamation is read.

When baskets of fruit and pots of water are carried through the streets for the use of the king, they are attended by an officer, and all the people who happen to be near must fall on their knees, and continue in that posture while they pass by; and when the king comes abroad, some of his elephants are instructed to fall on their belly.

The officers of the army have no salary, nor have the soldiers any pay; but the governors of the provinces and cities are obliged to give subsistence to a certain number of soldiers, and to find the palace at Ava such a quantity of provisions as is appointed. However, in time of war the king allows the army pay, cloaths, arms, and also provides magazines for the support of the troops; but the war is no sooner over than the cloaths and arms are returned, by which means the soldiers, being almost constantly without their arms, know not how to use them, and are little acquainted with discipline.

The quality of an officer is said to be known by the head of his tobacco-pipe, which is of earth or metal, with a socket to let in a jointed reed, which at its upper end has a mouth-piece of gold jointed like the reed, and by the number of joints in this golden mouth-piece, the quality of the officer, and the respect that is due to him are fully known.

All the towns in the king's dominions have a government that resembles a kind of aristocracy. The governor seldom sits in council, but appoints his deputy and twelve judges, who sit at least once every ten days, but oftener when business requires it. They assemble in a large hall, on a kind of stage about three feet high, and benches are placed round the floor for people to sit or

kneel upon to hear the trials. The hall is erected on pillars, and is open on all sides; and the judges sitting on mats in the middle, in the form of a ring, there is no place of precedence. Every man has the liberty of pleading his own cause, or sending it in writing to be read publicly; and all suits are determined within three sittings: but if any man questions his own eloquence, he may empower a friend to plead for him. These trials are attended with no expence: for the town, by an easy contribution, provides for the maintenance of this court. At the backs of the judges are seated clerks, who write down what is said by the plaintiff and defendant, and the affair is determined by the governor and these twelve judges with the utmost equity; for if they are found guilty of the least partiality, and the king is informed of it by the deputy of the town, the sentence is revoked, and the whole board corrected; so that very few appeal from their decision to the king, which they may do if they think themselves aggrieved; but if an appeal be made on ill grounds, the appellant is sure to be chastised.

Though the king's palace at Ava is very large, and built with stone, it is a mean structure. It has four gates; the Golden Gate, at which ambassadors enter, is thus named because all ambassadors procure an audience by presents. The south gate is called, The Gate of Justice, and is entered by all who bring petitions, accusations or complaints. On the west is the Gate of Grace, where all who have received favours, or have been acquitted of crimes, pass out in state, and all persons condemned are carried away loaded with fetters: and the north gate, fronting the river, is stiled The Gate of State, and through it his majesty passes when, according to the language of these slaves, he condescends to bless his people with his presence; and all his provisions and water are carried in at this gate.

Though the city is of considerable extent, and very populous, it is only built of teak planks, or split bamboos, because if any persons are charged with treason, or any other capital crimes, they may find no place of security; for if they do not appear to the first summons, fire is set to their habitations to fetch them out.

S E C T. V.

Of the Kingdoms of ARRACAN and TIPRA.

No authentic Account of those Countries, except the imperfect one given by Mr. Hamilton. The cruel Manner in which the King treated Sultan Sujah, and the Destruction of the Country.

IT may here be expected that we should give a description of Arracan and Tipra; but a regard to that veracity which ought to be dear to the geographer and historian, makes us more willing to acknowledge our being unacquainted with those countries, than to give absurd accounts repeated from authors, who, fond of the marvellous, relate the most extravagant and ridiculous stories, and shew so little regard to truth, that what would otherwise appear probable, is rendered doubtful. Thus, 'tis said, that one of the kings of Arracan built a palace, and laid the foundation of it upon women with child; and that being told that his life would be of short continuance, a Mahometan, whom he consulted, advised him to avert the prediction, by eating a composition of six thousand of the hearts of his subjects, four thousand of the hearts of white crows, and two thousand of the hearts of white doves.

In short, it does not appear that any traveller of credit has visited the interior part of either Arracan or Tipra; and it is certain, that Mr. Ovington, who has said so much of Arracan, was never nearer that country than Bombay and Surat. Mr. Hamilton has indeed visited the coast of that kingdom, which he says extends four hundred miles in length, from Xatigam, a town that borders on Bengal, to Cape Negrais; yet few places are inhabited, on account of the vast number of wild elephants, buffaloes, and tygers; the former of which would soon destroy the productions of the earth, and the latter

latter the tame animals brought thither: only some small islands near the shore are peopled by a few poor fishermen.

Arracan produces elephants teeth, tin, lead, stick-lack, and timber for buildings. Some of the Mogul's subject trade thither for these commodities, and sometimes meet with good bargains of gold, diamonds, rubies, and other precious stones, which are supposed to be some of sultan Sujah's treasure.

This sultan Sujah had been driven from Bengal by Emir Jemla, the general of Aurengzebe, and came a suppliant for protection to Arracan. This unfortunate prince had with him his wives and children, with about two hundred of his retinue, who were resolved to follow his fortune, and six or eight camels loaded with gold and jewels, which proved his ruin, and at length the ruin of the kingdom.

When sultan Sujah first visited the king of Arracan, he made him presents suitable to the quality of the giver and receiver, and the king promised him all the civilities due to so great a prince, with a safe asylum for himself and family. Emir Jemla, knowing where he had taken sanctuary, sent to the king of Arracan to demand the distressed prince, threatening, if he refused to deliver him up, to march with his army into his country, and take him away by force. This letter had such an effect on the king of Arracan, that he basely contrived the means of quarrelling with his guest, in order to obtain a pretence for sacrificing him to the ambition of Emir Jemla.

Sultan Sujah having a very beautiful daughter, the king of Arracan desired her in marriage, well knowing that sultan Sujah would not consent to the match, he being a Pagan and she a Mahometan. Her father in vain expostulated with the king, who daily becoming more pressing, he gave him an absolute denial; on which the king sent him orders to leave his dominions in three days; and commanded that the markets should no longer furnish him with provisions for his money.

Sultan Sujah, knowing it would be death for him to return to Bengal, resolved to pass over some mountains, overgrown with woods, into the dominions of the king of Pegu, which were not above a hundred miles distance; and therefore the next day after his receiving the message, began his march, with his family, his attendants, and his treasure; but the barbarous king sent after him a strong party, which overtaking him before he got into the woods, killed most of his attendants, and seizing the treasure, brought it back in an inglorious triumph. But what became of the sultan and his daughter is unknown; none being able to tell whether they were slain in the skirmish, or afterwards devoured in the woods by the wild beasts.

So much treasure had never before been seen in Arracan; but to whom it should belong caused some disturbance. The king thought that all belonged to him; those that fought for it claimed a share, and the princes of the blood wanted some fine large diamonds for their ladies; but the priests persuading them to dedicate all the treasure to the god Dagun, and to deposit it in his temple, they all unanimously agreed to the proposal.

In 1662 the king of Arracan dying without issue, two princes of the blood, contending for the crown, took up arms, and both resolving to seize the treasure, the priests removed it to a place only known to themselves; and the two princes pursued their quarrel with such warmth, that in one year both themselves and families were destroyed, and the kingdom left in anarchy; but it is now said to be subject, or at least tributary, to the

king of Ava; and this is also said to be the case of Tipra, which extends along the north of Ava, and is probably no more than a province of that kingdom.

S E C T. VI.

Of the Kingdom of ACHAM.

Its Situation and Mines. The People free from Taxes. Of the Coin of Acham; the Funeral of the King; and the Conquest of the Country. The People said to be the Inventors of Gun-powder.

THE kingdom of Acham, or Azem, is situated to the east of the great Mogul's dominions, and to the west of the lake Chiamay, and produces every thing necessary for the subsistence of man. As the country abounds in mines of gold, silver, iron, and lead, the king has reserved them to himself, and levies no subsidies from his people; and, that they may not suffer oppression, none are employed in working these mines but the slaves he purchases of his neighbours. Thus the people are free from taxes, and live at their ease, while the rest of the Indians are involved in all the miseries of slavery and oppression, in the midst of a country where providence has provided for them all the riches of nature in the greatest exuberance.

It is prohibited by the laws to carry gold out of the kingdom, or to coin it into money; yet it is used by the people in trade in great and small ingots; but these are not to be paid to strangers. The king, however, causes pieces of silver to be coined of the size and weight of roupies, and of an octagon form; and these may be transported any where.

The king resides in the city of Kemmerof; but the tombs of the royal family are in the city of Azoo, on the banks of the river Laquia, where every prince erects a kind of chapel in the great pagoda to serve for his place of burial.

Being persuaded that after death they go into a world where those who are stained with guilt suffer chiefly by hunger and thirst, they place food by the side of the corpse, that it may feed upon it if necessary. The king is said to be interred with those idols of gold and silver, which he worshipped when living; and an elephant, twelve camels, six horses, and a great number of hounds, are also buried, from the belief that they may be of use to him in another world. In these funeral solemnities barbarity is joined to superstition, and the woman he loved best, with the principal officers of his household, poison themselves, in order to enjoy the honour of being interred with him, and of serving him in the next world. When a private person is interred, all his friends and relations assist at his funeral, and throw into the grave the bracelets and ornaments they wear.

This country was hardly known before Mirgimola, general of Aurengzebe, conquered it, about the last century. He undertook this expedition with the greater confidence, as Acham had been without any wars for the space of six or seven hundred years, and the people had entirely neglected the use of arms. He found no difficulty in conquering such a people; yet tradition attributes to them the invention of gun-powder, which is said to have passed from Acham to Pegu, and from Pegu to China; which has given occasion to say, that the Chinese were the authors of that discovery. It is also said, that in this war Mirgimola took several pieces of cannon, all of which were of iron.

C H A P. XXII.

OF I N D O S T A N.

S E C T. I.

Its Situation, Extent, Provinces, Climate, principal Rivers, and Minerals; with an Account of a remarkable Phenomenon in natural History, occasioned by the Chain of Mountains that extend through the Peninsula.

THE name of India was doubtless derived from the river Indus, the western boundary of this extensive country, which is situated between the Indus and the Ganges; but it is at present known by the name of Indostan, or India Proper, and by the natives is called Mogulstan, or the empire of the great Mogul, who is descended from Tamerlane, who was a Mogul Tartar.

This country is of very great extent, and is bounded by Ufbec Tartary and Tibet on the north; by another part of Tibet, with Ava, Acham, and the bay of Bengal, on the east; by the Indian ocean on the south; and by the same ocean and Persia on the west. It extends between the sixty-sixth and ninety-second degree of east longitude from London, and between the seventh and fortieth degree of north latitude; and is two thousand and forty-three miles in length, from north to south, and in the broadest part one thousand four hundred and twelve in breadth, from east to west; but the most southern part of the peninsula is not three hundred and twelve miles broad.

The north-east division of India contains the province of Bengal, which is situated at the mouth of the Ganges, and those of Naugracut, Jesuat, Patna, Necbal, Gor, and Rotas, which are in the mountains of Naugracut.

The south-east coast of the peninsula, called the coast of Coromandel, contains the provinces of Orixas, Golconda, the east side of Bisnagar, or Carnate, Tanjour, and Madura.

The middle division contains the provinces of Afme, or Bando, Jengapour, Cassimere, Hendowns, and Lahor, or Pencab, Delly, Agra, Gualeor, Narvar, Ratipor, Chitor, Berar, and Candish.

The north-west division, on the frontiers of Persia, and on the river Indus, contains the provinces of Cabul, Haican, Multan, Bucknor, Tatta, or Sinda, Jesselmere, and Soret.

The south-west coast of India, generally called the coast of Malabar, contains the following provinces: Guzarat, or Cambaya, Decan, or Visiapour, and Bisnagar, or Carnate.

The dominions of the Mogul are chiefly above the peninsula, though it is generally imagined, that the whole is under his immediate government, and that the royal mandates from Delli are obeyed in the most remote parts of the coast: but Mr. Cambridge observes, that "this is so far from the truth, that a great part of this vast peninsula never acknowledged any subjection to the throne of Delli, till the reign of Aurengzebe; and the revenues from those Indian kings and Moorish governors who were conquered or employed by him, have, since his death, been intercepted by the viceroys, which his weaker successors have appointed for the government of the peninsula; so that at this time neither can the tribute from the several potentates reach the court of Delli, nor the vigour of the government extend from the capital to those remote countries. And ever since the province of Indostan was ruined by Nadir Shaw, the weakness of the Mogul, and the policy and confirmed independency of the viceroys, have in a manner confined the influence of the government to its inland department." Whence, as he afterwards observes, the sovereign really possesses only a third, and that the least valuable part of his own vast empire.

As the tropic of Cancer extends thro' the middle of it, the air is exceeding hot; but in the most sultry season

the rains, which usually begin at the latter end of June, and continue till about the close of October, cool the air and refresh the earth. When these rains set in, a day seldom passes without terrible thunder and lightning; and even during the fair season, they have lightning, tho' without thunder, for several weeks together; but this kind of lightning does no manner of harm. The heavens are clear and serene, except in the rainy season and about the time of the vernal equinox; for all the rest of the year is exempt from storms and hurricanes, and there are only such moderate breezes as the heat of the climate requires. The pleasure to be found in the mornings and evenings is not to be conceived; for not only the heavens seem to enjoy a more than usual purity and brightness, such as is never seen in these northern latitudes, but all trees and plants retain a perpetual verdure, and you behold blossoms and ripe fruit on some tree or other all the year round; and a late author observes, that the sight, the taste, and the smell, are all regaled in those delicious gardens, which come up to our finest ideas of a terrestrial paradise.

The excellence of the climate appears from the uninterrupted health and long life of the natives; but this is partly to be ascribed to their innocent food and the liquors they use, namely, rice, herbs, and fair water; and partly to the salubrity of the air; but there are low grounds near the sea, where the vapours arising from the ooze and salt marshes render the air unhealthy, particularly in the English settlement of Bombay, and the country of Bengal, through which the Ganges discharges itself by several mouths into the sea, and the whole province is, like Egypt, annually overflowed. However, nine parts in ten of the continent of India is as healthful as any part of the world; and as agreeable to European constitutions, after their recovery from the illness they generally contract during the first months after their arrival, which proceeds as much from the alteration of their diet, and a different regimen, as from any other cause.

The principal rivers of this empire are the Ganges and the Indus; the former is held in the greatest esteem, not only from its long course, the depth of the channel thro' which it falls into the bay of Bengal, and the purity of its waters, but from the imaginary sanctity attributed to it by the natives, who worship this river as a god, and happy is the man who breathes out his soul upon its banks.

The Indus waters the western side of India as the Ganges does the east, both running a course of about three thousand miles; but the entrance of the Indus is so choaked up with sand, that it is not navigated by great ships. It flows from the north-east to the south-west, and discharges itself into the Indian ocean by three mouths, in about the twenty-fourth degree of north latitude. Though these rivers run so far asunder, their sources are said to be near each other, and both are held to be in the kingdom of Tibet.

Besides these rivers there are many others, most of which will be taken notice of in mentioning the places by which they pass.

The mountains produce diamonds, of which we shall give a particular account in treating of the kingdom of Golconda, and also rubies, amethysts, crysolites, granates, agate, and jasper.

Before we conclude this section, it is necessary to observe, that the chain of mountains, which run through the peninsula from north to south, are the cause of an extraordinary phenomenon in natural history. The countries which are separated by these mountains, though under the same latitude, have their seasons and climate entirely different from each other; and while it is winter on one side of the hills, it is summer on the other. On the coast of Malabar a south-west wind begins to blow from the sea at the end of June, with continued rain, and

rages against the coast for four months, during which time the weather is calm and serene on the coast of Coromandel; and, towards the end of October, the rainy season, which they term the change of the monsoon, begins on the coast of Coromandel: at which time the tempestuous winds bearing continually against a coast in which there are no good ports, make it so dangerous for the shipping to remain there for the three ensuing months, that it is scarce ever attempted. This is the cause of the periodical return of our ships to Bombay, where there is a secure harbour and convenient docks.

S E C T. II.

Of the Soil and Husbandry of the Natives; with the Trees and Plants; particularly of the Indigo Shrub, and the Banian Tree.

AT the end of the fair season the earth resembles a barren desert, without one spire of grass or any thing green on its surface, except the trees, which never lose their verdure; but the showers no sooner begin to fall, than the face of nature is changed, and the earth is almost instantly covered with grass and herbs. The soil, consisting of a brittle fat mould, is easily broken up and prepared for tillage; and though they sow the same land every year, it is never manured, but is rendered sufficiently prolific by the annual rains.

In the northern parts of India they have as good wheat and barley as any where in the world; but in the southern part of the peninsula they sow nothing but rice, and indeed the natives scarce eat any thing else. The fields lie open, except near the towns and villages, where people form little inclosures for their own convenience; and as no man has any property in the land he sows, the prince's officers take a third, or one-half of the crop, or more, as they think proper, and leave the poor husbandmen the rest. Nor is it left to their choice, whether they will sow or not; for the respective governors and generals, having towns and villages assigned them, to enable them to support the quota of troops they are to furnish, order a particular spot of ground to be cultivated by every village, and at harvest send their officers to take as much of the crop as is thought proper.

They have no oats; their peas and beans are smaller than ours, but full as good; they have also a sort of peas called donna, rather larger than tares, with which they feed their horses; these they boil, bruise, and mixing coarse sugar with them, make them up into balls, which they give to their horses: they also sometimes give them balls made of a composition of barley-meal, and other ingredients.

Their cream, instead of butter, produces a substance like thick oil, and will never be brought, in that hot climate, to such a consistence and hardness as ours, yet it is very sweet and good; and as they have plenty of milk from their cows, buffaloes, and goats, the people in the north of India make a considerable quantity of cheese. There can be no whiter or better wheaten bread than that made at Bengal and several other parts of India, but the natives seldom eat any of it: they, however, make thin flat cakes of wheat flower, which they bake upon iron plates, and always carry with them in their journeys.

The country produces no great variety of flowers, and yet the gardens are extremely pleasant, being adorned with winding walks of fine fruit-trees, always green and blooming, with large basins of water; and handsome cascades. Those flowers that are natives of the country last almost all the year; but, though they have a beautiful mixture of colours, few of them have any smell. The rose and a white flower like that of the jessamine are the only ones that are very fragrant.

The fruit-trees are the banana, or plantain, the cocoa-nut, mangos, guavas, oranges and lemons, limes, mirabillions, pomegranates, jaccas, tamarinds, ananas, or pine-apples, and mulberries; to which may be added the arekanut, and betel. In the north part of the empire are apples, pears, and other European fruits.

The kitchen gardens are well stocked with water-melons, musk-melons, potatoes, and other roots, and

pot-herbs. They have also saffron, turmeric, opium, the pepper-plant, ginger, cardamums, and considerable plantations of sugar-canes, particularly in Bengal.

The cotton shrub is of great use, for of this are made their gingham, muslins, calicoes, &c. They sow large fields of the seed, which grows up to the height of a rose bush, and then puts forth yellow blossoms, which are succeeded by little cods, which swell to the size of a small walnut, and then the outer skin bursting discovers a fine soft wool as white as snow. The seeds are always found amongst the wool.

They have also the cotton tree, which grows to a great height; the fruit, if it may thus be called, becomes of the size of a hen's egg, and then bursting like the other, yields a fine white wool.

The indigo shrub grows to the height of a gooseberry-bush, and has a thick round head, but no thorns. The people strip off the leaves, and having laid them in a heap, they lie several days till they have sweated, and are then put into deep vessels, with a sufficient quantity of water, to which they give their blue tincture. The water is afterwards drained off into broad shallow vessels, made of a kind of plaster of Paris, where the sun having exhaled all the moisture, there remains at bottom a hard dry cake about a quarter of an inch thick, which is our indigo. The best sort is brought from Biana near Agra, and a coarser kind is made near Amadabat.

There are also abundance of fine woods and groves, that afford timber for building of houses and ships, and considerable quantities of red wood for dying. One of the most remarkable of their trees is the banian tree, the boughs of which bending to the earth, take root and grow up again like the mother-plant, whence one of them will have forty bodies and upwards, and spreading themselves far around afford shelter for a regiment of soldiers under its branches; which bearing leaves that are ever green, afford a noble shade. Under these the gentoos frequently place their idols, and here their devotees reside, and perform those penances which appear extremely surprising to all Europeans, and which we shall mention in treating of the religion of the Gentoos.

S E C T. III.

Of their Caravans, in which they use Oxen. Of the Camels, Elephants, and other Beasts of India, with a Description of the Shogoose. Of the Birds, Insects, and Reptiles, particularly the Scorpions, and a remarkable Kind of Serpents, with some curious Particulars relating to the latter. Of the Fishes of India, among which are described the flying Fish, the Benito, the Albacore, the Dorado or Dolphin, the Shark, and its Attendants the Pilot-Fish, and Sucking-Fish.

OF all the animals of India, none appear more useful than their oxen, which generally serve for draught and carriage, and are sometimes shod: they are not very large, but swifter of foot than ours, and will carry a man twenty or thirty miles a day. Caravans, in which are sometimes eight thousand oxen, are employed in carrying rice, salt, and other things from place to place. Their drivers have no fixed abode, but take their wives and children with them. Each of these caravans has a captain, who wears a string of pearls around his neck, and assumes the dignity of a prince. The people who follow the profession of carriers are divided into four tribes, each consisting of about one hundred thousand souls, who always sleep in tents. One carries only corn, another tribe only peas and beans, another rice, and another salt; and the persons of each tribe are distinguished by certain marks made in their foreheads. The horns of the oxen would endanger the lives of their riders, by their tossing their heads back, when tormented by the flies, were they not sawed pretty short. Ten or a dozen of them are employed in drawing one of their heavy carriages; but they have no more than two to their coaches, which will hold only two people. When they bait, they are fed with balls of paste.

Camels are also used for carriage, though less frequently than oxen. They cannot tread sure in slippery ways, but

but seem peculiarly formed by nature for those dry and sandy deserts, which, without their assistance, would be impassable, since they will travel several days successively over hot burning sands without water.

The elephants of India, when at their full growth, are some of them twelve or fifteen feet high, and yet so tractable that a boy may govern them. It is a common mistake, that they have no joints in their legs, for they lie down and rise up like other animals: their pace is a walk, but they stretch so far as to travel five miles an hour, and are so sure footed, that they never stumble. Their keepers by signs, and the sound of their voice make them understand their meaning, and if they make a sign to them to terrify any man, they will advance towards him in a threatening manner, as if they intended to trample him to death, and yet not hurt him. If the keeper directs him to throw water or dirt in a man's face, he will do it without farther mischief. The elephant takes up whatever he eats or drinks with his long grisly trunk, and thus conveys it to his mouth, and this trunk, though extremely limber, has such strength that if he strikes a horse or a camel with it in earnest, he will kill him at a blow. It indeed supplies the use of hands, for with it he will pluck up the corn and grass by the roots, knock off the dirt that hangs about it against his legs, and then convey it to his mouth. He will also tear down the branches of the trees with it, and eat the tender twigs. Scarce any animal will swim faster, for at Fort St. George, where the ships that bring them can only come within two or three miles of the shore, they frequently make them swim to land, but they have little more than their trunks above water, through which they breathe. The male elephant is sometimes mad after the female, when he becomes so mischievous as to strike any one he meets, except his keeper; at that time therefore they chain the elephant by the legs, and if he happens to get loose, he will overturn every thing in his way, nor is it possible to divert his rage without fireworks, which bursting with a loud noise will make him stand still and tremble. When the elephants are in these mad fits they sweat prodigiously, and smell much ranker than a goat.

In the Mogul army are several elephants that will not only stand fire, but suffer a great gun to be discharged from their backs. Those they carry are about five feet long, placed on a square wooden frame that is fastened to a broad thick pannel, tied on with strong cords and girths. At the four corners of this frame are four silk flags fixed to little staves. Upon the neck of the elephant the man is seated who guides him, and has an iron rod in his hand, about half a yard long, sharp at the lower end, and a hook turned up, with which he pricks him forward, or pulls him back. The gunner is seated on the wooden frame, where he has his ammunition and ball with every thing necessary for loading and firing. The balls discharged from these guns are about the size of a tennis ball.

The elephants are usually fastened by a chain about one of their hinder legs to great trees, under the shade of which they are kept. Each of the great war elephants is allowed by the Mogul four females, and they are said to be so modest, that they will not permit any one to see them in the act of copulation.

They have also buffaloes and asses; the former are more sluggish than the oxen, and have a smooth thick skin without hair; the female gives milk, and the flesh, which is sometimes eaten, is coarse food.

In the southern parts are thin long legged sheep, whose backs are covered with a reddish hair instead of wool, but their flesh is lean and dry. However, towards Persia and Tartary they have fine sheep with good fleeces and large tails, that weigh several pounds. It is observable of the Persian sheep brought into India, that they have each from three to seven horns, some of which stand upright on their foreheads, and the battles of their rams are very bloody. They have also plenty of goats, and their kids are pretty good eating. The Indian hogs are esteemed the best butchers meat in India, especially the wild hogs, which are very plentiful.

There are great numbers of antelopes, deer, and hares, and as nobody claim any property in them, every body are at liberty to kill them, as well as all other game; for tho'

the Mogul is the proprietor of all the lands in the country, he does not monopolize either the wild beasts, or the wild fowl. Even the grass, herbs, and trees, and whatever grows spontaneously in the woods and extensive fields, are enjoyed by the people in common: so that though they have no lands that they can call their own, they have almost an equivalent from the privileges they enjoy in those of the prince. The only beast of the forest, the hunting of which the emperor reserves to himself, is the lion. There are also tygers, leopards, wolves, monkeys, and jackalls, which last are a kind of wild dogs of the colour of a fox, but somewhat larger. These run about at midnight in companies, making a dreadful howling, not only in the country, but in the midst of the great towns. It is said, that one or more of these always attend upon the lion, and hunt his prey for him. However, there are great numbers of them in all parts of the country, as well in those parts where there are no lions as where there are: they are very fierce, and if a corpse is not buried deep, they will scratch it up out of its grave.

Among the beasts of India we ought not to omit a fierce little creature called a shoe goose, which is about the size of a fox, with long ears like those of a hare, and a face like a cat; its back and sides are grey, and its breast and belly white. These, as well as dogs, are used in hunting; on which occasion a horseman carries the shoe-goose behind him, hood-winked, and as the antelopes and deer are pretty familiar, they will not start before the horses come very near. He who carries the shoe-goose then takes off the hood and shews it the game, which with large swift leaps it soon overtakes, when springing on their backs, and getting forward to their shoulders, it tears out their eyes with its claws, and makes them fall an easy prey to the hunters.

They also sometimes hunt with a tame leopard, which runs down his game, and frequently gives the hunters as long a chase as the dogs, and when the game betake themselves to swimming, which they frequently do, it will follow them into the water.

With respect to the feather'd race, they have here plenty of all kinds of poultry, and also pigeons, turtle-doves, quails, partridges, peacocks, and parokets. The flesh of their poultry is, however, generally lean and dry, and some of them have bones as black as jet; but their flesh is thought as well tasted as that of the others.

Vultures are here extremely common, and perfectly tame, which probably proceeds from the banyans feeding them as they do other animals; they are said to be considerably larger than an eagle, and much of the same shape.

There is a kite here with a white head, for which the banyans have a high veneration, and seem to pay it religious honours. These birds, when flying in the heat of noon, are frequently overcome by the scorching rays of the sun, and drop down in the streets. Upon such an accident, the soldiers in our settlements always make money of it; for carrying the kite into the market place, they threaten to wring his neck off, upon which the superstitious crowd contribute small pieces of money to purchase the bird's life and liberty.

They have not many singing birds; but they have one less than a wren, which has ravishing notes, and a beautiful plumage. The multitudes of monkeys which infest the woods in the southern parts of India, are terrible enemies to these little birds; but nature has taught them to preserve both themselves and their young, by building their nests at the extremity of the twigs, where they hang like small purses out of their reach. There are also in this country bats almost as large as kites.

The pleasure of living in so delightful a country as India is much abated by the multitude of troublesome insects and reptiles. The musketoes or gnats, and bugs, immediately seize upon the Europeans on their first landing, and are so venomous, that in one night's time a man's face will be so swelled that his companions cannot know him; but when they have been some time in the country, though they are always pestered with them, they do not leave such swellings as at first. They are indeed so troublesome, that every man who can afford it, keeps a servant to brush them off his person, and it is

in vain to attempt to sleep with the face uncovered, without somebody to beat away the gnats, and as for the bugs they swarm among the soldiers and the common people. They have, however, one way of avoiding them, and that is by daubing the feet of the couch on which they lie with tar, which they have either an aversion to, or are stopped by their sticking in it.

During the rains frogs and toads multiply prodigiously, and grow to a considerable size. The rats are three or four times as large as ours, and are so bold that they will hardly give a man the way.

Of all the venomous creatures of this country the scorpions, centipedes, and serpents, of which there are many different kinds, are the most dangerous, for they breed in every corner, and there is no possibility of being secure from them without continually sweeping.

Of the scorpions there are various kinds, those in the woods are said to be black, and their sting mortal. The house scorpions are about the length and thickness of a man's little finger, and, according to Mr. Salmon, are shaped almost like a lizard, but carry their tails turned up to their backs, and at the end of the tail is a sting not much bigger than a hornet's, and always visible. They creep very slowly, and it is easy to cut off their stings, which the above author says he has often done. The stings of these are not mortal, but they create a violent pain, like that of a red-hot iron applied to the part; but the anguish is abated by anointing the part with the oil of scorpions, and in about twenty-four hours the pain entirely ceases.

The centipede derives its name from the great number of its legs; those of this country are somewhat bigger than a goosequill, and three or four inches in length; but though they are so small, their bite is very dangerous.

There are here many kinds of serpents, but they will not attack a man, unless first provoked, or incited to it by their keepers; for there are people who keep them in baskets, and carry them about to shew their tricks. One of those which Mr. Salmon saw, raised himself up near half its length, then spread his head as big as the author's hand, and shewed a beautiful face, nearly resembling the human; this species the English imagine is the same that tempted Eve.

Mr. Grose mentions a kind of incantation of these reptiles, and says, that when a snake, lurking in a house, has bit any one, one of their jugglers is sent for, who will with an instrument, something resembling a flageolet, play certain tunes, the sound of which operates so powerfully on the snake, that he leaves his hole, and with visible reluctance presents itself to those that stand ready to kill him. "I am fully aware," says that gentleman, "of the ridicule this will meet with from many, but prefer even the certainty of incurring it, to the suppression of what I tried myself to disbelieve till convinced of it."

A clergyman, who was with our ambassador at the Mogul's court, relates, that while he was there the Mogul sentenced a man to die for killing his mother, and as the most terrible death he could contrive, ordered him to be bitten by two serpents. Accordingly one of the people, who keep serpents in a basket for shew, was sent for: the criminal was stripped naked, and stood trembling, while the master of the snakes, having irritated and provoked them, put one to the wretch's thigh, which immediately wound itself about him, and bit him in the groin till the blood followed; the other was set on the outside of the other thigh, and bit him likewise: notwithstanding this, the criminal kept upon his feet a quarter of an hour, but complained of a fire raging in all his limbs, and his body swelled to a great degree; the serpents were taken off before he fell, and about half an hour after the wretch breathed his last.

The Indian seas abound with vast shoals of fish, among which we shall only mention a few of the most remarkable. The bald-pate is thus called from its head and neck being without scales, and is very good eating.

The raven-fish is so named from its mouth having some resemblance to the bill of a bird: it is only a span long, red on the back and tail, and yellow on the belly.

The flying fishes, which are most generally seen within the tropics, are commonly of the size of a large herring, to which they have some resemblance. The large size of their side-fins countenance the opinion of their being assisted by them, in the spring they make out of the water, on being pursued by larger fishes of prey, as those fins continuing spread must naturally gather some air; but it is highly probable, that what is called their flight, is no more than an extended leap, like that of the flying-squirrels on shore; and that their necessity of replunging into the water is not so much owing to their fins drying in so short a space as twenty-five or thirty yards, and requiring a fresh wetting, as to the force of their spring being spent: for it is evident, that they are not guided by their sight, but are urged on by a mechanical impulse, so that they frequently fall into ships. They are well-tasted, and are often seen in great shoals flying from the pursuit of the bonitos, albacores, and dorados, whose favourite prey they are; nor does this fish find enemies only in its own element, for several sea-birds watch hovering for its immersion, and dart down upon it with such rapidity, as to make it their prey before its replunging into the water.

The bonito undoubtedly takes its name from its being highly agreeable to the taste of the Portuguese, the first Europeans that navigated the Indian ocean, and gave it this name, which, in their language, signifies delicious. It is indeed a firm and not unpleasant fish, but rather dry, and requires a rich sauce to entitle it to its name.

The albacore is nearly of the same kind as the bonito, but grows to a much larger size, some being taken from sixty to ninety pounds weight, and upwards. Its name is also taken from the Portuguese, who thus denominated this fish on account of its whiteness. It is rather dryer eating than the bonito. Both these fish are often caught by an imitation of the flying-fish, which being swung to and fro, represents their flight, so as to bring them greedily to the hook; they are likewise frequently struck with the fish-gig. It is remarkable that both are also at certain seasons infected with a worm that makes them in an agony spring so high out of the water, as to fall into such boats as are in the way of their leap.

The dorado, or dolphin, is allowed to have obtained that name very improperly, it having not the least resemblance to the descriptions and delineations of it given by authors, painters, and statuaries. The Portuguese give it the name of dorado, from its golden hue, which appears through the ground-work of a beautiful azure that is blended with it; but though nothing can be conceived to have a more lively gloss than its colours, this fish is no sooner taken out of the water, than they begin to fade. It is caught in the same manner as the bonitos and albacores; but is greatly preferred to them in point of taste. They are commonly three or four feet long, and finely shaped, only the head seems rather too large; though the chief bone of it, on dissection, appears admirably modelled for a cut-water, and indeed they swim with inconceivable rapidity.

The shark, which is commonly met with near land, is not unfrequently found in the main sea; but this is chiefly in calms, or very light breezes, when he will follow a ship for a considerable time, unless betrayed to the hook by his natural voracity; for he is generally too large to be mastered by a harpoon or fish-gig. Almost any bait will serve, but it requires a strong hook of the larger size, and running tackle to bring him on board. He no sooner touches the deck, than he makes it shake with the violent flunces of his tail, which are capable of breaking a man's leg; but he is soon subdued by a cut of an ax upon it, which instantly depriving him of all power, he is soon dispatched.

This fish is commonly from nine to fifteen feet in length, and it is said some of them are upwards of twenty feet long. It has no scales, but the skin is rough, like shagreen, of a deep brown, inclining to a greenish colour, and whitening by degrees to the belly. The shark would have been much more terrible, had nature endowed it with an agility answerable to its voracity, which is remarkably assisted by a dreadful triple row of teeth as sharp as razors. But, besides its not being the swiftest

swiftest swimmer, its mouth, by being placed considerably within the projection of its snout towards the belly, obliges it to turn on its back, or at least sideways, to snap at its prey, which it does so heavily, that good swimmers will, with a knife, either for diversion, or for the sake of shewing their skill, attack it in its own element, and diving under the belly, where the skin is very soft, rip it open, or oblige it to sheer off. How they engender is unknown: but Mr. Grose says, it is certain that the females are not only viviparous, young ones being found alive in their bellies when taken, but that they occasionally afford them a retreat in it till they outgrow the size of wanting one.

A shark will generally afford a meal for a whole ship's company; but then they are the ranker in proportion to their size, and at best are but indifferent eating, except the fins, which, though covered with a very hard skin, when dried in the sun, and well stewed, afford a very delicate dish.

There is a species of this animal called the bottle-nosed sharks, which are of a dark blueish colour, but are not thought good to eat.

The shark is attended by the pilot-fish, which is one of the most beautiful that swims; it is seldom above a foot or foot and a half long, and is streaked transversely with blue and a yellowish brown, that have a pleasing effect in the water; but, when taken out, lose much of their shining lustre. They are frequently seen in small shoals swimming near the shark, or at the head of him. They crowd about the bait that is thrown to the shark, without nibbling at it themselves, and by their motions seem to guide the shark towards it, from whence they derive the name of pilot-fish. They seldom take a small hook when in company with a shark; but when they have lost him, or follow a ship either singly or in shoals, they will sometimes bite and be caught. They are esteemed, for their size, the most delicious eating that the ocean affords.

The sucking-fish is a very troublesome companion to the shark: it seldom exceeds a foot long, and is frequently much shorter; but by means of an oval-shaped membrane, of a texture admirably adapted for that purpose, sticks so close to the shark's skin, commonly on its back or sides, as not to part with it, even when they are taken out of the water; and no strength of hands can separate them if pulled against the grain of the sucker; but sliding them on forward with the grain, they easily come off. This force of adhesion continues while life lasts, as may be proved by applying them to a table, or any other hard substance. This fish doubtless annoys the shark in the manner of vermin, drawing its sustenance from the slime that oozes from its body, while the shark can neither shake it off, nor come at it to destroy it: the gills open upwards, and it is of a dull, muddy, slate colour; but is unfit to eat, it having neither substance nor taste.

As the sea is infested by sharks, so is the river Ganges by crocodiles, which are fed by the multitude of dead bodies which are cast into that river.

The shell-fish on the coast of India are very good, particularly oysters, which at Fort St. George are of the same size as those of England, and not inferior to them in goodness. There are some shell-fish in these seas of a prodigious bulk.

S E C T. IV.

Of the Persons and Drefs of the Gentoos and Mahometans of India : of their Manners and Customs.

THE Indians are well shaped, of a good stature, and agreeable features; and have hardly any crooked or deformed people among them. An English divine observes of their women, that their sprightly motions, agreeable persons, amorous glances, and irresistible mien, are the admiration of all foreigners, and frequently captivate the wisest. Those who inhabit the northern part of this empire are of a deep tawny or olive colour, and those in the south perfectly black; and the inhabitants of the mountains in the middle of the pe-

ninsula are all extremely black: but in every part of the country the natives have black eyes and long black hair. These blacks dye their teeth like their neighbours, and frequently rub over their skins a yellow powder: many of them likewise mark their foreheads with long yellow strokes of a finger's breadth.

The Indians generally drefs in a white vest of silk, callicoe, or muslin, which folds over before, and is tied with strings, either on the right or left side; the sleeves sit close to their arms, and, being very long, are in wrinkles about the wrist: the upper part of the vest fits the body so as to shew the shape; but from the middle downward, it sits full in plaits, reaching almost down to their feet. Under this vest they wear another that is something shorter, and, instead of stockings, their breeches cover their legs; and they put their bare feet into their slippers, which are made peaked like a woman's shoe, and turn up at the toes.

In the north part of India the people in affluent circumstances have shirts open before that hang over their breeches, and in cold weather make use of a cloak. Some of the common people among the Gentoos go perfectly naked, except a string tied round their waist, to which they fasten a cloth of a hand's breadth, which they bring up between their legs and fasten it to a string before: this just covers, but scarcely conceals, what they pretend to hide; and these are the people who carry the palanquins, and attend the English ladies when they go abroad.

Those women that are seen by the Europeans have a piece of white callicoe tied about their waist that reaches down to their knees, and the remainder of it is thrown over their bodies like a shoulder-belt, covering their breasts and part of their back. The hair of their heads is made up in a roll, adorned with such jewels and toys as they can procure: they have also jewels in their ears and nose; and sometimes stretch the hole that is bored in their ears to such an extent, that it will admit a shilling to pass through it. Their wrists and ancles are adorned with bracelets, and they have rings upon their fingers and toes, either of gold, silver, or brass. The men also frequently wear bracelets about their wrists. As to shoes or slippers, the women in the southern parts wear none.

The drefs of the Moors is extremely becoming; they having, like the greatest part of the other Asiatics, that originally Indian manner of wearing turbans of fine muslin, the circumvolutions of which, says Mr. Grose, form a covering to the head, at once light and cool, from the air easily penetrating its folds; at the same time that they defend it from the rays of the sun, the heat of which acting in a straight line, as cold likewise does, is rebated by the obliquity of the wreathing; which, admitting of an infinite variety in the making up, serves also to distinguish the tribes, professions, and rank in life of the wearers.

The drefs of these Indian Moors, nearly agrees with the description given of it by Quintus Curtius, who says, that such as are eminent for their birth and riches, clothe their bodies with a garment that falls down to their feet; they bind their hands with linen; they hang their ears with jewels, and deck their arms and limbs with gold. Thus it appears how tenacious the Indians are of their old customs, and how closely their Tartar conquerors have conformed to them.

Another point of their finery is their sashes on the outside of their long vest, which are generally richly embroidered, with the two ends hanging before, bordered with gold or silver tissue interwoven. In these they stick on the left side the handles of their daggers, which are either curiously wrought or set with precious stones; the blade is short, broad, and pointed. Their scymetars are also hung carelessly before them, with the same curious workmanship in the hilts. They wear embroidered slippers, which they take off within doors, or leave at the foot of the sophas when on a visit. Even the Europeans, on obtaining an audience at the Durbar of Surat, before they are admitted to sit in the divan in the presence of the governor, must submit to pull off their shoes, which is the less unreasonable, as the floor is generally spread with the richest carpets.

The Moors are fond of smoaking, and the great among them affect the Persian luxury in having cullions, which resemble glass decanters, with flowers painted in their proper colours at the bottom. These are full of water, and plugged up with a machine, that holds the lighted tobacco, and also a leathern pipe wired round, two or three yards in length, pliant, and coiled like a snake. Through this pipe they suck in the smoke, which is rendered mild and cool, by first passing through the water, which it causes to gurgle, so as to form nouplesing noise. The poor make use either of a cocoa nut shell, prepared in the same manner for smoaking through the water, which is vulgarly called, from the noise it makes, a hubble-bubble; or merely the tobacco leaf rolled up, of about a finger's length, which they term a buncus, which is chiefly used by the Gentooos.

As to the manners of the Moors and Moguls, they are nearly the same as those of the southern Asiatics, they being greatly degenerated from the hardiness and martial spirit of the northern Tartars, as well from the relaxing softness of the climate, as from their sliding into the Indian voluptuousness and effeminacy. They are, however, from their childhood, tutored and trained up to great gravity and circumspection in public, and especially to curb their passions, to prevent their breaking out into outward emotions of anger and resentment, which they consider as the highest indecency. It perhaps proceeds from this early habit of restraint and dissimulation, that their resentments, which might otherwise evaporate in menaces or opprobrious terms, wrangle in their bosoms, till it breaks out into more sanguinary effects, and a vindictiveness much more fatal: thence arise the frequent plots, perfidious conventions, and deep-laid schemes of the great to destroy each other.

Their school-education, which is generally no more than learning to read the Koran, and to write Persian, or Arabic, is followed by their introduction into all companies, and into public business in their tenderest youth: thus their fathers carry them without due preparation into the great school of the world.

The Gentoo merchants also use the same method with their children, initiating them with the first dawn of reason into all the mysteries of trade; so that it is not uncommon to see boys of ten or twelve years of age so acute and expert, that it would be difficult to over-reach them in a bargain; and, indeed, their docility, sedateness, and the awful respect they pay their parents, are surprizing, considering their extreme fondness for their children, which they temper so judiciously as not to spoil them.

The common Indian salute is lifting the right hand to the head, and if it be a person of distinction, bowing the body a little, but they never salute with the left hand alone. When the Mahometans meet, their most usual compliment is, God give you health; to which the other replies, God give thee the same health, or Mayest thou have the prayers of the poor. The salutation of a prince is bowing the body low, putting the hand to the ground, then to the breast, and afterwards lifting it up to the head, and this is repeated three times.

A person visited does not meet his guest, but intreats him to sit by him on the carpet, and betel and areka are offered him to chew, which, as in the neighbouring countries, they have almost constantly in their mouths. They are very reserved, and seldom talk aloud or very fast. They play at a game that nearly resembles chess, and sometimes at cards; but seldom high, as in China, and in the neighbouring island of Ceylon; nor are they much disturbed when they lose, but preserve an even temper.

S E C T. V.

Of the Pleasures and Luxuries of the Indians, particularly of their dancing Girls; their Equipages; and other Articles of Luxury. The Method of Clamping used in India.

AT festivals, and on other occasions, it is usual to send for the dancing girls, who sing and dance

before the company, and readily retire with any young men that desire it. They act comedies in the open air by torch light, nor are they ill performed: love and gallantry are the usual subjects.

The dancing girls form a distinct branch of the community. These are sent for to a particular place, which is their district, where there are never wanting a sufficient number for the use of the public, to which they are so devoted, that they seem to have made vows of unchastity: according to their institutes, they are bound to refuse none who will come up to their price, which is governed by their degree of beauty and accomplishments. Particular sets of them are appropriated to the service of the Gentoo temples, and the use of the bramin priests that belong to them. They live in a community under the direction of some superannuated female of the same profession, under whom they receive a regular training, and learn all the arts of pleasing, in which they are but too successful; for nothing is more common than for the princes and chief men of those countries to take a particular liking to one of these women, and to lavish immense sums upon them, though their harams are stocked with far superior beauties.

Their dances would, however, at first appear disagreeable to the Europeans, especially as they are accompanied with a dull kind of music, consisting of those little drums called gum-gums, of cymbals, and a kind of fife, which make a hideous din, and are played on by men, who, with their grimaces and shrivelled features, shock the eye and torture the ear; but by use they become reconciled to the noise, and may observe some pleasing airs with which the dancers keep time. The words frequently express the subject of a pantomime dance, such as a lover courting his mistress; a procuress endeavouring to seduce a woman from one gallant in favour of another; or a girl timorous and afraid of being caught in an intrigue. These love-scenes the girls execute in character-dances with no despicable expression. In some of their dances they pay little regard to modesty in the motions of their limbs, and the lascivious attitudes into which they throw themselves, though without exposing any nudity; for they are richly dressed, and adorned with jewels. In short, they omit no allurements, and meet with such success, that some of them amass great wealth.

Mr. Grose observes, that the dress of these women is the most splendid and alluring that can be imagined. They are generally loaded with jewels from head to toe; for on their toes they wear rings. Their necks are adorned with carcanets, their arms with bracelets, and their ancles with chains of gold and silver, generally enriched with precious stones. They wear also nose-jewels, which at first have an odd appearance; but to which the eye is soon reconciled. They, as well as other women in that country, have a peculiar way of covering their breasts, which make no inconsiderable part of their finery. They inclose them in a pair of cases exactly fitted to them, and made of a very light wood linked together, and buckled on at the back. These confine the breasts, and prevent their growing to a disagreeable size, and yet from their smoothness and pliancy, play freely with every motion of the body: they are besides gilt, and set with gems, according to the ability of the wearer, and thus compose the richest part of their dress from the display favoured by their orbicular form; at the same time they are easily laid aside and resumed at pleasure.

Many of them use the antient embellishment practised through the greatest part of the East, of forming a black circle round the white of the eyes, by drawing a bodkin between them and the eyelids, that both may receive the tint of the powder of antimony, that sticks to the bodkin. They pretend that this refreshes and cools the eyes, besides increasing their lustre by the ambient blackness.

The dancing girls occasionally assume another ornament, composed of a necklace of many loose turns, formed of flowers strung together, that resemble double Spanish Jessamine, but have a stronger and more agreeable fragrance, and are far preferable to any perfumes.

*The Swing, on which the principal Persons in India,
pass away much of their Time.*

As to the equipages and carriages of the Moors, they chiefly consist in elephants, horses, palanquins, and hackrees.

Riding on elephants is a piece of state principally appropriated to the Mogul himself, the princes of the blood, the great officers of state, and the Nabobs, or Viceroy of provinces; and nothing can surely be more adapted to strike the mind with awe, and raise the impressions of pomp and grandeur, than one of those enormous beasts richly caparisoned, and bearing on its back a kind of canopied throne, in which the person who sits in such majestic state is fully conspicuous from such an eminence. These unwieldy animals are, however, growing into disuse for war, since the more prevailing use of fire-arms, and its being discovered that, notwithstanding their amazing docility, it is impossible to break and train them to the field so perfectly, as to be certain they will not do more mischief to those to whom they belong, than to the enemy, especially when exasperated with wounds, to which their prodigious bulk makes them a mark hard to miss.

The best horses used in India are brought from Arabia, but chiefly from Persia; these make a considerable article of trade both by sea and land, and, indeed, no part of the world produces finer horses than either of those countries. The Moors likewise spare neither care nor expence in their keeping, and in breaking them for war.

Of all the methods of travelling that of the palanquins, or, as they are usually pronounced, palanqueens, appears most adapted to humour their constitutional indolence, as a more lazy method of conveyance cannot well be conceived. It consists of a bed and bedstead, with short feet, covered with an ample canopy, which is commonly either of velvet or cloth, fastened by means of cross sticks, and silk or cotton cords, to an arch of bamboo; from the ends of which arch proceed the poles, which are all of one piece. The person carried may conveniently sit upright under the arch, and be bolstered up in that posture by one or two large pillows; and occasionally he may lie at his whole length and sleep by the way. This arch is prepared, while the bamboo is young, by keeping it bent so as to grow in the desired form, according to the perfection and size of which it bears a greater or less price. Some of these palanquins are rendered very expensive from the decorations employed on them, as the rich stuff with which this portable couch and its canopy are covered; from the expence of its gold or silver tassels, and the feet being carved and plated over, representing couchant lions, griffins, or other figures. The ends of the poles, on which the palanquin is carried by six, but most commonly by four bearers, are likewise adorned with the same metals, in the form of tigers heads; but this is a badge of authority granted only to a few persons of the highest distinction. In this point they are imitated by the English; for though there are few men of eminence in our settlements that do not keep palanquins, the tigers heads are reserved for the governor and second of the council.

Some of our gentlemen at Calcutta, disliking perhaps the indolent attitude in which they are placed in these carriages, invented a new one, in which the bedstead is converted into a platform that supports an armed chair fixed to it, in which they sit more decently, and full as conveniently under the canopied arch; and others have contrived a perfect sedan-chair, only preserving the bamboo form at the top and at the ends, so as to be carried on the shoulders of the bearers. In Bombay and Surat they cover them during the rains with a kind of thatch, easily put off or on, made of the leaves of the brab-tree, a species of wild palm, and lined with calicoe, thus forming a shelter impenetrable to the most violent rain, and having windows that shut or open at pleasure. In Bengal and other places they are defended, but not so effectually, with an oil-cloth thrown over them.

The jealousy of the Moors makes them cover the palanquins, in which their women are carried, by a various coloured silk netting thrown loose over the whole machine; which, without excluding the air or obstructing the sight from within, only hinders those without from

seeing them. The Moors have indeed affixed such an idea of state to palanquins, that, in most countries they have conquered from the Gentoos, they are forbid from using them, except on the day of their marriage; for which institution they preserve so high a veneration, that it is proverbial with them that a man on that day is as great as a king, and consequently they grudge him no ensigns of royalty.

They have a machine called andolas, which are of the same nature as the palanquins: but the cross sticks being fastened to a straight instead of an arched bamboo, will only admit of their lying at length. These are much cheaper, and less esteemed than the palanquins.

They have another carriage called a dooly, which resembles the andola, but is only made of the meanest materials, and is seldom used but to carry the poorer sick.

The hackrees are drawn by oxen, some of which being trained for drawing, will go as fast as horses on a full trot, and the smallest are generally the most fleet. These are chiefly used by the Gentoos, especially by the banyans and merchants of Surat. These oxen are kept as sleek and as clean as possible, and a pair of them yoked together are far from having a disagreeable appearance; the oxen of that country, especially of Guzurat and Cambay, being generally white, and some of them at least as large as our Lincolnshire cattle. As a contrast to the whiteness of their skins, they paint their horns with a shining black, and hang bells about their necks. The hackrees are open on three sides, covered on the top, and made to hold two people sitting cross-legged in the oriental manner, with a pillow at their backs to support them, or to recline upon; and consequently they have no raised seats. Here their jealousy has invented another method of concealing their women, by means of folding blinds or checks let fall round the open sides. These are generally coarsely painted, and made of the fibres of the cocoa-nut or brab-tree leaves, so disposed and loosely sewed together, as to let in the air, and not hinder the sight of those within. Each hackree has its driver, who sits on the shaft equipped with a goad, and takes care of the oxen; but in Bengal the most eminent of the Gentoos ride on horseback, or in a chaise; and, being under no fear of fleeing under the English government, they shew themselves fond of a parade which they dare not shew in a place under the government of the natives, and therefore have them richly ornamented, and even the reins adorned with silver or gilt studs.

The Moguls themselves and the principal Moorish courtiers generally affect great state and splendor, and none study more the luxuries of life, though in a manner somewhat different from the Europeans. They take care to have their harems or seraglios furnished with the most beautiful women that can be procured. Those of Cashmere are the most admired by the Moguls, they being much fairer than in any other province, and have a delicacy in their shape that greatly pleases the Moors. Their taste of beauty is pretty singular, for they scarcely scruple any price for a female slave, which, added to her other beauties, has a plumpness that covers the smallest bones.

They are extremely jealous of the women, they shut up in their harems, and follow the usual Asiatic method of committing them to the guard of eunuchs, who are generally made such by a total abscission; and the blackest Abyssinians are preferred both on account of their colour and of their fidelity and discretion, in which they excel the slaves of other nations. Nothing can well be imagined more cruel, or more opposite to the benevolent intentions of nature, than thus sacrificing a number of poor creatures to the jealousy and caprice of one man, who, perhaps, amidst three or four hundred nay as far as a thousand and upwards, confines his embraces to a very few of them; while the others, in the flower of their age, and with all the violence of unsatisfied desires, inspired and nursed by the heat of the climate, languish and pine away in misery and gloomy discontent.

This custom of engrossing such numbers of the fair-sex is, as a learned and ingenious traveller remarks, attended

tended with the most fatal consequences; for besides the injustice of rendering so many amiable persons miserable, and the injury done to the population of the country, it leads both the great and the meaner sort from very different causes to the crime against nature; for as this custom necessarily thins society of the women that would otherwise appear on the rank for wives, the poorer sort, from the scarcity of that sex, are led to give a most criminal turn to their passions, and to betake themselves to their own; while, on the other hand, the abundance of women at the command of the rich, create a satiety that produces the same effect: so that every consideration, both human and divine, serves to establish the preference of the European law in permitting but one wife, to the polygamy and concubinage of the orientalists.

In short, the Moguls have adopted not only the language but the manners of the Persians; their buildings are all in the Persian stile, and, like them, they are fond of fine gardens; and especially of water, both dormant and in action, from natural or artificial cascades and fountains, and the climate supplies them with plenty of evergreens. They have commonly in the midst of their gardens neat airy pavillions, contrived with a particular regard to coolness; there the owners frequently indulge themselves during the heat of the day in parties of pleasure with their women, and in the cool of the evening by the sides of pieces of water, which are generally in the form of an oblong square, neatly ornamented with steps, and with places for recumbence on the middle of every side, spread with Persian or Turkey carpets.

Their gardens generally resemble those of the Chinese, in the wilderness stile, with this particularity, that instead of having the door in the middle, as in the European manner, it is usually placed at the corner of the wall, by which means the pavilion is not fronted by the avenue that leads to it; and, instead of presenting to the view a length of gravel, or an uniform green walk, the eye is delighted with beds of flowers, as variegated as possible, and, in all the confusion and agreeable wildness of nature, offering different scenes to the view on every side of the pavilion, to the corners of which the walks obliquely lead. They have no taste for statues, knots, and compartments, formed with perfect symmetry.

Amongst the articles of luxury, which the Indians have in common with many other parts of the East, and especially the Mahometans, they have public hummums for bathing, cupping, sweating, and rubbing, which need no particular description; but the practice of champing, which seems to have been practised by the ancient Romans, is worthy of being fully explained. After a person has gone through the ceremony of sweating, bathing, and rubbing, which, however, are not always previously used, the person lies down on a couch, bed, or sofa, where the operator handles his limbs as if he was kneading dough, or pats them gently with the edge of his hands, and chafes or rubs them, concluding with cracking all the joints of the wrists and fingers: and, if the person pleases, those of the neck, at all which they are extremely dexterous. This they imagine not only supple the joints, but procures a brisker circulation of the fluids, which, from the heat of the climate, are apt to loiter through the veins. This excites in some a kind of pleasing languor or delirium, under which they are ready to faint away, and sometimes actually do so; and it is so common, that it would be difficult to find a barber, who is a native, unacquainted with the method of practising it; this being one of the essentials of their profession.

In short, "in most of the particulars in which the luxuries of life consist, these orientalists are, as Mr. Grose observes, little, if at all, inferior to the Europeans. If they have not their taste for statues, paintings, cabinets of medals, and such articles of refined curiosity, they are at least not deficient in those of a sensuality, to which the warmth of the climate so strongly and so unhappily inclines them; being by this enervity and relaxation, generally speaking, rendered unsusceptible of those manly virtues, and that hardi-

ness constitutional to those born under the colder and rougher zones: thence, most probably, the indolent and slavish acquiescence of the eastern nations in general, under that detestable form of government, despotism; where not the profusest fertility of the soil, nor the Elysian temperature of the air in many parts, nor the choicest blessings of nature, can atone for the want of the greatest of them, liberty. Here an Englishman cannot but, in the comparison, find incentives, if that could be necessary, to the love of his country, in which the mildest laws, under the most admirably tempered constitution, secure to him his life, his property, and, what is dearest of all, his freedom."

SECT. VI.

Of the Roads, and the Method of travelling. Their Buildings and Furniture.

THE roads are generally a deep sand, which in the fair season is so hot about noon, that it would burn the feet of the poor travellers, if they were not as hard as a shoe-sole; and there is no such thing as walking in these sandy roads with shoes. Upon the great roads, at the distance of every ten or twelve miles, are choulteries, or caravanferas, which are houses for travellers to refresh themselves in: they have no doors, but are open on the side next the road, and generally consist of two rooms, in one of which the travellers spread their carpets and sleep, while the poons, or foot soldiers who attend them, get ready their provisions in the other. The erecting of these houses for the accommodation of travellers is in this country esteemed an extraordinary act of charity. There is generally a reservoir of water near them, and some good people in the neighbouring villages frequently take care that fire shall be provided for dressing provisions.

When a man of substance travels, he usually hires eight or ten cooleys, or chairmen, to carry his palanquin; four of these run at the rate of four or five miles an hour, and their companions relieve them at certain times without standing still. Besides these chairmen, it is usual to hire as many musqueteers and pikemen, to defend them from wild beasts and robbers; and these twenty men will not cost above five shillings a day, they being hired for three-pence each. Before a person intends to bait, he sends some of his cooleys to the villages to buy provisions, and an earthen pot, which does not cost more than a half-penny, to dress them in, and they pick up flicks for firing as they go along.

The usual time for travelling is in the morning and evening; for during the heat of noon people generally sleep. In many parts of India, where people are in danger of being attacked by the mountaineers, they travel in caravans, or large companies of two or three hundred men. On these occasions, camels, oxen, and asses, are used for carrying of goods; for the Persian horses are too valuable to be used merely as beasts of burthen, and their own small breed are not very fit for it.

Travelling in the rainy season is exceeding troublesome, the flat country being overflowed, and innumerable torrents falling from the mountains; yet this is not sufficient to hinder the common people from taking journeys at this time of the year; for the people are extremely expert at swimming. Mr. Salmon says he happened to be in the country during the rains, and having two or three broad rivers to pass, which ran with very great rapidity, he trusted himself to two blacks, who took him between them, and swam across a river with one hand with all imaginable ease; and in the same manner the whole company, amounting to twelve or thirteen persons, were taken over.

There are no such things as posts established in the country, but all letters and paquets over land are sent by messengers on purpose, who are very reasonable in their demands, and travel on foot with great expedition.

Having mentioned the roads, we shall now take notice of their manner of building, which is of two sorts, those erected by the original Indians, and those of the Moguls

Meguls or Mahometans. As the Gentoo inhabitants are at least twenty to one throughout the whole empire, their houses fill the most considerable towns; but nothing can appear meaner than the generality of these structures, which are low thatched cottages, with clay walls, and have only one floor. However, in the principal streets, and in the bazars, or market-places, there is some uniformity observed: in the front of the houses are sheds, supported by small pillars, under which are thrown up banks of earth. Under the shade of these sheds people either expose their goods to sale, or sitting upon mats and carpets, entertain their friends, or transact their business, whilst they enjoy the benefit of the open air, and of every breeze. They have no windows to the streets, which render them still more disagreeable; even the palaces of the princes or rajas have nothing on the outside that appears very elegant, and are most of them built in one form. Before the gate is a large piazza or roof supported by pillars open to the front. Upon advancing towards the gate, the earth is raised to the right and left, about a yard high; and upon these banks are spread fine carpets or pieces of European scarlet cloth, with cushions of the same sort, to loll upon. Here the raja sits to hear the complaints of his subjects, to entertain foreigners, or transact affairs of state. A late author says, that he saw one of these princes sitting under such a cover before the gate of his palace, attended by his guards with glittering arms, and a hundred flambeaux: he was dressed in a muslin vest, a white turban, and abundance of jewels sparkling about him; but the next day when our author saw him stripped of his ornaments, and with a small retinue, the scarlet cloth and carpets removed, and the building which the night before he imagined to be a splendid palace, to have only clay walls, it abated much of the opinion he had entertained of his greatness.

There are, however, some good houses in their stile of building, which is partly Gentoo, and partly Moresk. Those of the greatest note have the gateway contrived as to render it defensible against a sudden attack of a few armed men; a circumstance of considerable importance in cities where opposing the first attack of any persons sent by the government to oppress or destroy the owner, is often attended with future security, by giving time to raise a party capable of opposing such proceedings. For the greater security of the women, of whom the Moors especially are remarkably jealous, the private apartments always lie backwards. They are extremely fond of having one room, in the middle of which a fountain is kept playing; for by the noise of the falling water they are lulled to sleep, and at the same time they are refreshed by the coolness it diffuses through the apartment; but it is attended with a dampness that might be prejudicial to the constitution of an European. They have the common convenience of the eastern sophas, so commodious for sitting cross-legged, and they are fond of European looking-glasses, with which they chiefly adorn their rooms. They have another ornament which has a pleasing effect; the beams of the ceiling are sometimes curiously inlaid with ivory and mother-of-pearl, in flourishes and scroll work. They have generally a kind of saloon, which they term a divan, entirely open on one side to the garden.

S E C T. VII.

Of their Food, and their principal Dishes. - An Account of an Indian Entertainment. Of their Fondness for drinking Spirituous Liquors, though prohibited. A Story of the Effects of Drunkenness.

THE times for eating are chiefly in the morning and evening; for as the middle of the day is generally very hot, they endeavour to pass it away with sleep; the Europeans, however, eat at noon, and lie down to sleep soon after; but when they make an entertainment, it is usually in the evening.

As to the diet of the Mahometans, it is far from being despicable. Instead of bread they use rice stewed dry, and think it more wholesome, light, cooling, and

natural to the climate. They correct its insipidity by the sauces with which they accompany it, which are made of fowl, flesh, or fish, generally cut or stewed, so as not to want the knife when served up. The great point with them is to have it savoury and high-seasoned: Meat seldom comes to their table in joints, yet they are very fond of a lamb or kid roasted whole, and stuffed with raisins and pistachio-nuts, which they then eat with it instead of bread.

They have a great variety of dishes, for which they have different names; but the three most common ones are, currees, kitcharees, and pilow.

The currees are extremely various, they being a sort of fricasees made of any animals or vegetables eaten with rice: these last are chiefly used by the Bramins, who never eat what has had life; but the principal ingredients are the pulp of the cocoa-nut, for thickening it, turmeric for turning it yellow, and spices.

Kitcharee is only rice stewed with a kind of pulse called dholl, which they esteem very wholesome and nourishing, and is generally eaten with salt-fish, butter, and pickles of various sorts.

Pilow is a boiled fowl covered with rice boiled dry, to which are added spices and turmeric: they sometimes render it extremely expensive by the addition of ambergris.

Most of the Europeans soon become reconciled to the country diet, and many at length prefer it to their own, even in point of taste, independently of its being more wholesome, and more adapted to the climate than the quantities of flesh we are accustomed to eat in these colder countries.

Mr. Salmon says, that when he was in the country, he was invited to dinner by a wealthy black, and was brought into a hall or outer room, which had a bank of earth, about a yard wide and near as high, all round it. When the company were sat down cross-legged upon this bank, a servant placed a leaf as big as the largest cabbage-leaf before every one of the company, instead of a plate: soon after he brought in a large brazen bowl full of boiled rice, and laid about a quart or three pints of it upon each man's leaf: another brought in a deep dish of strong broth or soup, with the venison of which it was made cut into little square pieces like dice. To every person he distributed a quantity of the soup to mix with his rice, and some of the meat, which was very savoury, was laid upon the side of each leaf. Every man had a bottle of water set by him, and drank when he pleased, without healths, or any other ceremony, nor was any other liquor brought. They sit or lie reclined on carpets on the floor, when they eat, and have cloths spread to set their dishes on.

As the meat is ready cut to their hands, they use neither knife, fork, spoon, or any other instrument in eating; but taking a handful of rice, squeeze it into a lump as big as an egg and put it into their mouths; they have no napkins to wipe their hands and mouths with, but wash before and after their meals. Some of them will not touch with their lips the bottle or cruise out of which they drink, but, holding the vessel high, pour the liquor into their mouths, and will thus swallow a great deal without once gulping, or spilling a drop.

Besides water, which is their common drink, they have palm wine and toddy, neither of which will raise the spirits much when they are new; they have also the milk of the cocoa-nut, and when they are hot and fatigued, they drink milk with garlic infused in it; but besides these smaller liquors, they have several kinds of spirits, that go under the common name of arrack, some of which is distilled from toddy, some from sugar, and some from rice, but the last is both the weakest and the worst, and is called pariar arrack, as fit only for the pariahs or common people. This liquor is not very expensive, a hoghead, containing fifty gallons, is frequently sold for forty or fifty shillings. As for beer and wine none are made in the country, and what is brought from Europe is excessive dear; for a bottle of common beer is worth eighteen pence, and fine ale and wine four shillings and sixpence a bottle each.

Few of the Mahometans of India abstain from wine, when they have an opportunity of being treated with it by the Europeans: but they are much fonder of cordials and drams; but do not think even arrack strong enough for them, unless triple distilled; they are, however, so cautious, that the greatest drinkers among them are never seen in public disordered with liquor; yet the vice of drunkenness sometimes precipitates their governors and great men into a dangerous abuse of their power; of which the following story, which we shall take from Mr. Grose, will both serve for an instance, and strongly characterise the genius and government of these people.

The Nabob of the district of Ahmadavad, a prince of the Mogul's blood, not many years ago, in a drunken fit, had given an order to set fire to the great city of that name. His vizier, who saw that he was not in his senses, and yet durst not by a wise but hazardous disobedience shock the profound eastern jealousy of despotic authority, in this nice dilemma, applied for advice what to do to a Persian princess, wife to the Nabob, and not more remarkable for the exquisiteness of her beauty, than for that of her wit and good sense; being besides, not only more learned than the generality of women in those countries, but skilled in the composition of Persian poetry, all which merit of the mind and person was not thrown away, since it had succeeded in entirely captivating and attaching her husband to her, who reposed himself principally upon her for the care of his government. Her answer upon this consultation was entirely conformable to the maxims of eastern government, and to the dictates of humanity. "The authority of the prince," said she, "is too sacred a point, for either thee or me to take upon us to revoke his order. He must then literally be obeyed. Find out in any corner of the town, some of the most detached little houses, from which there may be the least danger of the flames spreading. Set fire to them, first giving the owners time to escape, and paying them amply for the damage; and thus my husband's authority will be saved, and any material mischief prevented."

This counsel was immediately put into execution, and, besides entitling the authoress to the thanks of her husband, when recovered from his intoxication, raised the reputation of that princess all over the empire of the Mogul.

But, to return from this digression, some casts of the Gentoos wholly abstain from animal food, and among these the simplicity of their lives appears wholly answerable to that of their diet; for this regimen, an ingenious traveller observes, seems to have an influence on their minds as well as their bodies, they being generally free from the more violent passions and vices, in which the cold one of avarice is certainly not included; those of them at least who enter into temporal affairs, vie with any other condition of men; and with respect to their constitution, they are generally healthy, though not strong bodied. Their senses of smell and taste are exquisite, which they doubtless owe to their abstinence from flesh: thus to them flowers produce a much stronger odour than the same sort would to Europeans; and they are as nice in the taste of different waters as the latter are in that of wines, and make as great a point of luxury in the choice of them. It is also observable that the wounds of those used to vegetable diet are much sooner and much easier cured than those of such as eat flesh.

SECTION VIII.

Of their Genius, Languages, Manner of Writing, Learning, and Skill in the Sciences.

THE Indians are men of strong reason, and had they the advantage of literature, might have been the authors of many excellent works. They are, however, said to have some of Aristotle's books in the Arabian tongue, and some of the works of that celebrated phy-

sician Avicenna, and likewise some fragments of the Old Testament in the same language; but this is only to be understood of the Mahometan inhabitants, many of whom are descended from the Arabs. These have but few books, which are all in manuscript for the art of printing has not been introduced amongst them.

The language of the Mahometans is very different from that of the antient original Indians; yet, being destitute of letters, they have borrowed the Indian characters, and in all their writings use either those of the Pagan Indians or of the Persians. The court language is the Persian, which is not only spoke by all the great omrahs, but by all the polite in general; but the learned language is the Arabian.

The Indians have a great variety of languages very different from those used by the Moors. The Bramins, the chief sect of the Gentoos, have a language peculiar to themselves, called the Hanferit, in which the Vedham, Shaster, and the other books of their law are written. There are also the Malabar and Gentoos tongues, which are most commonly spoken by the Pagans; the first upon the coast of Malabar, and the other upon the coast of Coromandel; but no language is more universally understood, both on the coasts and in the trading towns, than the Portuguese, which is the *Lingua Franca* of that part of the world; but it is mixed with some Indian words, and is far from being spoken with the same purity as in Portugal.

The Gentoos generally write with an iron stile, or bodkin, on cocoa or palm-tree leaves, not like the Chinese in a straight line downwards, but from the left hand slanting to the right. The Moors have, however, a thin shining paper, sometimes ten feet in length and a foot broad, and tack as many sheets together as the writing requires; the pen they write with is the antient calamus, or reed, which is about the thickness of a goose-quill. When they write to a prince, the whole surface of the paper is gilt; and for the security of those letters of consequence that are sent to court, they are rolled up close and inclosed in a hollow cane, or bamboo, and the end of it sealed up, that no wet may be able to injure them. Upon their seals, or chops as they are called in this country, they have no coats of arms; these are entirely unknown in India; but they have their own names engraved on gold or silver, or on a cornelian.

They have a great value for their history, which is written in verse, and consists of fabulous relations of their subordinates deities and heroes: they have also their saints and martyrs, whose memories they celebrate, and give entire credit to all the adventures and miracles recorded in the songs of the Bramins.

The Gentoos, or original Indians, begin their year on the first of March, and the Moors on the tenth, when, according to their astrologers, the sun enters into Aries; and the year is composed of thirteen moons.

They divide the day into four parts, and the night into as many, which they call pores; and these they again subdivide into eight parts, which they call grees, or graris; and, according to the antient custom, measure them by water dropping out of one vessel into another. In some great towns a person is appointed to look after the vessel, and to turn it up when all is dropped out, at which time he strikes the number of the pores and grees as they pass with a hammer upon the brim of a piece of metal like a pewter-dish; but the common people in the country are obliged to guess at the time of day: and indeed it is not very difficult to know it in the southern part of India, where the sun constantly rises and sets at about six o'clock.

Few people excel the Bramins in the practical part of arithmetic, this being their principal study; for, from their infancy, they are taught to cast up sums by their fingers, without the help of a pen.

The Bramins have some tables, formed by the antient astronomers, for calculating eclipses, and are pretty exact in their predictions; but they are entirely ignorant of the theory. They consider the day in which an eclipse happens as a time of plenary indulgence; and, by washing themselves in water, believe they receive the remission

remission of their sins. Nothing can be more extravagant than their system of the heavens: they imagine that the moon is above the sun, though the contrary is demonstrable by eclipses; and that the sun, when he sets, hides himself behind a mountain. Yet they are acquainted with the twelve signs of the Zodiac, and give them the same names in their language as we do in ours.

The science most universally practised among them is astrology; and even the Mogul will not so much as undertake a journey, or form any important resolution, except the astrologers tell him that it is a fortunate hour; and the very moment they prescribe, he sets about it. The Gentoo Indians are to this day so infatuated with astrology, that their merchants will not let a ship sail, or strike a bargain, or, in short, undertake any business of importance on those days that are set down for unlucky ones. The Indian Bramins are generally the almanack-makers of the country, and constantly mark in their calendars what they call their good and bad days, in the observation of which they are invincibly superstitious.

The Indians have no skill in anatomy; they however use simples, and apply them with success. The Bramins are said to possess many valuable secrets in natural philosophy, which they have acquired by their studious and contemplative turn; and which, if not brought to Europe, is less owing to any reserve in them, than to the want of curiosity and inquisitiveness in the Europeans; who seldom travel to those distant parts in search of knowledge, and are too much engrossed by views of raising a fortune to employ sufficient attention, or to use the means of becoming masters of such discoveries.

For bloody-fluxes the Bramins suggest a very simple, and, according to them, a most infallible remedy, consisting of a strict abstinence from every thing but rice stewed dry, to which they allow no sauce: to this they attribute an absorbent quality, that is excellent against that acrimony which preys on the entrails, and breeds the disorder. They allow no other drink but water, corrected by a very moderate quantity of cinnamon, or cassia lignum.

The mordechin, a most violent disorder, chiefly known on the Malabar coast, seizes the patient with such violent purging, vomiting, and pain in the intestines, that it will frequently carry them off in thirty hours. In this the physicians know no remedy more effectual than the actual cautery applied to the soles of the feet, the powerful revulsion of which seldom fails of producing a salutary effect.

The popish missionaries, and even many of the protestants are of opinion, that the Bramins cure most distempers by charms. They tie little bits of paper about the patient's neck, using at the same time an unintelligible jargon, which serves to amuse the common people; but at the same time use natural means, which there would be little occasion for, had the devil as great a share in these cures as is imagined. But in no instances do they make use of these pretended charms more than in recovering persons bitten with snakes: besides the other means used in this case, they always keep the patient awake, and sing and play to him as they do to the serpents when they dance. Some Europeans have highly extolled the virtues of the snake-stone; this is a small artificial stone almost flat, with a little protuberance in the middle, and of a grey colour. It is said to be composed of the ashes of burnt roots, mixed with an earth found at Diu, a Portuguese town in India. It is said that this stone being applied to the part invenomed sticks fast, and by its powerful attraction sucks out the poison, till the pores being full, it falls off; but, on being put into milk, emits the venomous matter it has imbibed, and again recovers its alexipharmic quality, and may be applied as before; and if this stone be scraped into a glass of wine, or any other liquor, and taken inwardly, it is reputed to be a most powerful medicine against malignant fevers; but the pretended virtues of the snake-stone are now generally exploded in India, and the cure of those wounds caused by the bite of these venomous reptiles are left to Indian physicians.

S E C T. IX.

Of their Skill in the mechanic Arts, Manufactures, and Trades; with a particular Account of the Construction of their Ships, and the Integrity of their Merchants. Of the Barbers of India, the Ingenuity of their Jugglers, and of their dancing Serpents.

THE mechanics and artificers of India are greatly admired for their fine muslins and calicoes; some of these muslins are so exceeding thin, that it is said a whole piece may be drawn through a ring; and yet if a piece be torn in half, they will work it together so neatly that it cannot be discovered where it was torn. The chints and calicoes on the coast of Coromandel are painted with a pencil by the meanest of the people; but those to the northward are printed; and yet the colours of either of them never wash out. They not only paint birds, beasts, trees, and flowers, but will draw the picture of a man tolerably well; and it is said they will copy our best pieces so perfectly, that it will require a good judge to distinguish the copy from the original; but their skill in this particular is probably much exaggerated.

They have the art of drilling holes through China-ware, and sowing it together with brass wire; so that a bowl broke into half a dozen pieces will hold liquors as well as at first.

The goldsmiths work curiously in filigree, and imitate any goldsmith's work made in Europe; and yet both the forge and all the tools they use are not worth ten shillings. They are even frequently seen at work in the middle of the streets; a goldsmith there being a mean employment.

The cement used by their builders is harder than their bricks, it being made of sea-shells; and they will terrace the roof of a house, or lay a floor with it, that shall resemble one entire stone, and be full as hard.

The Indians fail most in iron-work. They make no watches, clocks, gun-locks, or any hard-ware that requires good springs; however, in some parts of India they forge very good sword-blades and poniards.

At Surat they excel in the art of ship-building; and if their models were as fine as those of the English, which they are the fondest of imitating, it might be asserted, without the least exaggeration, that they would build incomparably the best ships in the world for duration; but their naval, as well as their other architecture, has always something clumsy, unfinished, and unlike the work of an artist. Their ships are much longer than those of the Europeans in proportion to their breadth; and it is not uncommon for one of them to last a century, which is less owing to the summer-seas in those parts, than to the solidity of their workmanship, and the nature of the wood of which they are made. Their bottom and sides are formed of planks let into one another, so that the seams are impenetrable; and the knees, or crooked timbers, are generally of the natural growth into that form, without their being warped by fire, especially where particular care is taken of their construction.

The wood is of a particular sort called teak, which is full as durable as oak, and has this advantage, that it is not so apt in an engagement with cannon-shot to fly in splinters, which commonly do more mischief to the men than the balls themselves. They have likewise a peculiar way of preserving their ships bottoms, by occasionally rubbing into them what they call wood-oil, which the planks imbibe, and is of great service in nourishing and keeping them from decay.

Their ships are not launched from slips, but by digging canals from the water to where the stocks, or what they call their cradles are, and dropping them into the stream that is brought up to them.

They use pohn mast chiefly from the Malabar coast; but all the cordage that is good for any thing must come from Europe; their coyr-ropes, made of the fibres of cocoa-nut husks, being more harsh and unmanageable for either running or standing rigging than what is produced from hemp. They have, however,

very

very large and serviceable coyr-cables, which last much longer in salt-water than in fresh, which is apt to rot them; and as our iron is much better than theirs, their anchors are mostly European. Their country manufacture of cotton into a sail-cloth called dungaree, supplies them with sails, which, though neither so strong nor so lasting as ours, are more pliant, and less apt to split; and, instead of pitch, they make use of the gum of a tree called damar, which is not inferior to it.

Their navigators have but little skill, but are sufficient for the purposes of conducting ships where they seldom put to sea, but in the fair season, and consequently rarely meet with storms. Their common sailors are rather better in their class, though they want the vigour, expertness, and patience of fatigue, for which the Europeans are distinguished.

The Banyans, who are professedly merchants, have been represented by some authors as a tricking artful set of people, and full of such low cunning as renders it difficult to deal with them; but this is so far from being true, that these merchants are in general the fairest and openest dealers in the world. Those of Surat especially are famous for the simplicity and frankness of their transactions. As an instance of this, on a ship's coming thither laden with goods, nothing more is necessary to be done than for the commander or supercargo to bring his musters or samples on shore, together with his invoice; and these merchants, resorting to him, will, if the assortment suits them, immediately strike a bargain for the whole cargo, with no other trouble than settling the percentage upon the items of the invoice. In this manner, says Mr. Grose, many a cargo, from five to thirty thousand pounds, and upwards, has been sold in half an hour's time, with very few words, and the amount immediately paid, either in ready money, or by barter, according as the buyer and seller have agreed, with at least as much probity as is ever practised by the European merchants of the most established character.

These Banyans have indeed one advantage over our merchants, but yet we cannot reasonably complain of it; this is the remarkable coolness and serenity with which they conduct all their transactions. If you offer them shamefully less than their goods are worth, or fly into a passion at their under-rating yours, there is no such thing as provoking them to shew the least indecent heat of temper. They calmly suffer you to evaporate your resentment without interruption, and patiently wait till your fit of drunkenness is over, for they consider it in no other light, and then calmly return to the same point; and if they depart from it, you may be certain it is not occasioned by any thing you have said in the heat of passion, but in consequence of their own inward reflections. In this particular they have the same advantage over the Europeans, as a cool gamester has over a passionate one.

Amongst their meaner trades we shall only mention here their barbers, who constantly shave with the grain, and perform their work with great ease and dexterity. They have all one uniform set of materials, a round glass with a handle, which they stick in their girdles like a dagger, and put it in your hands while you are shaving; a small copper tumbler, no bigger than a tea cup, and some instruments for picking the ears and paring the nails, either hung on a wire, like a bunch of keys, or put in a case. The orientalists in general must be allowed to be extremely studious in the cleanliness of their persons, which they imagine conduces to the pleasure of the mind.

In describing the ingenuity of the Indians it will not perhaps be descending too low, to take notice of their tumblers and jugglers, who, as in other countries, go from town to town; and are so dexterous, that some of our countrymen have very weakly attributed their tricks to magic and the power of the devil; and the ingenious Mr. Grose says, their deceptions are so amazing, that he has not the courage to relate what he himself has seen them perform, for fear of being taxed with running in to the marvellous, of which travellers are so fond. We have already mentioned their incantation of snakes; and it will not be improper to add here, that people carry those reptiles in round baskets; and when they uncover

them begin to sing and play upon their pipes, at which all the snakes raise up the upper parts of their bodies, and keep time with the music by the motion of their heads, while their lower parts remain coiled up in the bottom of the basket. If the music ceases ever so little, they leave this kind of dancing, and getting out of the basket hiss at each other, as if they would fight; but, on renewing the music, they immediately fall to dancing again. The Europeans are not very fond of having these snakes, some of which are very large, come near them; though they are told by their owners, that there is no danger to be feared from them, for it is said their teeth are pulled out. What degree of skill and ingenuity is necessary to teach these reptiles thus to divert the people by their actions, it is impossible for an European to conceive.

SECT. X.

Of the different Tribes of the Gentoos.

THE distinction of the Gentoos into casts or tribes forms a remarkable peculiarity in their religion and government, and has both its conveniencies and inconveniencies. Their warriors, priests, merchants, husbandmen, and all the various artificers and mechanics known among them, are each classed in their respective tribes; and, though all profess the same religion, they must neither eat, drink, nor intermarry with each other, so that a carpenter cannot marry his child to a smith's; for all must be born in the profession they exercise, and no transition or mixture is allowed. Thus great injustice is frequently done to genius and talents, to which they pay no regard, nor make any allowance for that infinite diversity produced by nature. Thus some are confined to make an insignificant figure in one sphere, who might shine in another. Yet this distribution has the advantage of orders and the prejudices of education in favour of this custom diminishes, and even annihilates, the sense of the injury done to a few.

Besides, as most of the tribes have a chief, who is in some measure accountable for the conduct of the individuals of which his tribe is composed, it is easy to estimate, number, or assemble, in any government, the individuals on any necessary occasion. One would imagine, that most professions, and more particularly the manual arts, being transmitted from father to son through a long succession of ages, would be carried to the utmost perfection; but it does not appear that this is really the case; for they stick pretty nearly at the same point they were at many ages ago. Emulation is perhaps deadened by this confinement, or perhaps the people of those soft climates want the solidity, curiosity, and application necessary to carry them beyond a certain degree of perfection; and besides, the precariousness of property must be a constant discouragement under a despotic government.

As the Indian Gentoos believe the doctrine of the metempsychosis, and the stricter tribes will kill no animal whatsoever, lest they should oblige the soul of a parent or friend to quit its habitation, it might be expected, that nothing but mildness, gentleness, and humanity, would prevail amongst them, and that the horror of shedding blood would endanger every Gentoos state, and render it a prey to the first invader; but that so rich and delightful a country might not want defenders, the province of war was, according to the Gentoos system of religion, left to other casts, particularly the Ketterees, from which are taken their rajahs, kings, chiefs, and generals, who are born to the profession of arms. The Nayrs, Rathboots, and others, are also born warriors; and these being the men, who, by the constitution of their religion, govern the state, it is the less wonderful that they commit those acts of injustice and violence which generally accompany the sword, and shews how a religion that breathes nothing but humanity, mildness, and universal charity, produces such tyrannical forms of government.

It also appears very extraordinary, that while they are so tenacious of the superstitious observances, they are liable to lose their right of communion, not only for voluntary

*A Gentle Woman burning herself on the Funeral
Pile of her Husband.*

luntary breaches of them, but for such as one would imagine extreme force or necessity might justify. Numbers of them, though in other respects afraid of death, would sooner suffer it than violate any of those fundamental points, on which their right of communion depends, such as tasting of beef, drinking or eating out of the same vessel with those of another religion, which is a desilement never to be repaired. As for instance, when Llofdafs Vittuldafs, a considerable Banyan merchant, was on his passage from Bombay to Surat in an English ship, he having made a provision of water, in vessels of his own, under his own seal, such as might serve for that short run, being usually of no more than two or three days, it happened that through delays occasioned by calms and contrary winds, it was expended, and he reduced to the condition of perishing with thirst, though there was plenty of water on board; but that being profane to him, no intreaties could prevail on him to break his law, though he felt all the torments of thirst, under which he would actually have sunk, had not a favourable breeze sprung up, and brought him to Gundavee near Surat, but to faint as to have his soul, as they express themselves, between his lips.

This religious scrupulosity not only subsists among the Gentoos with respect to those of other religions, but between the different tribes of their own, who never eat or intermarry under the same penalty. In some parts this nicety extends even to civil distinctions, as on the coast of Malabar, where it is capital for a nair, or noble, to approach so near an inferior cast as to receive a wound in which blood is drawn. It is not many years since an extraordinary accident of this kind happened near Penany, the residence of the samorine of Calicut. A nair happened to have a struggle with a thyvee, or tiller of the land, when as in jest they grappled each other, and the thyvee's sickle accidentally wounded the nair, who no sooner saw his own blood, than letting go his hold he entreated the thyvee to make off as soon as possible, and for both their sakes to keep the accident a secret. It happening, however, to take air; the nairs assembled; and one of the elders rising up and exposing the case, they instantly fell upon the poor nair and cut him to pieces with their sabres, after which they lamented over him, and then proceeded by way of revenge for the sacrifice their law had compelled them to make, to exterminate the whole tribe of the thyvees in the village where the author of the mischief dwelt. Yet even in this they shewed, that amidst this wild superstition they could remember equity, for care had been taken to inform the thyvees of what was intended, that they might escape till the day set for the massacre was over, after which it is unlawful to revive the procedure, and they might without danger return to their habitations.

Amongst these nairs principally prevails the strange custom of one wife being common to a number; in which the great power of custom is seen, in its never producing any jealousies or quarrels among those who possess the same woman. Besides, the number of these husbands is not so much limited by any specific law, as by a kind of tacit convention, by which it seldom happens, that it exceeds six or seven. The woman is, however, under no obligation to admit more than a single attachment, though she is not the less respected for using her privilege in its utmost extent; and they are sometimes said to have twelve husbands: but they, as well as she, must be all of the same tribe.

When the daughter of a nair is married to the first of her husbands, he builds her a house, in which he alone cohabits with her, till she takes a second. The husbands all agree and cohabit with her by turns, according to their priority of marriage, each eight or ten days, or as they can fix the term among themselves; and he who lives with her, during that time, provides for her support. When the man who cohabits with her goes into her house, he leaves his arms at the door, and none dare remove them, or enter the house on pain of death; but if there are no arms to guard the door, any of them may freely visit her. All the time of cohabitation, she serves her husband as purveyor and cook; she also takes care to keep his cloaths and arms clean. When she proves with child, she nominates its father, who takes care of

its education, after she has suckled it, and taught it to walk and speak; but from the impossibility of assigning the true heir, the estates of the husbands descend to their sisters children, and if there are none, to the nearest in blood to the grandmother.

This account, improbable as it may appear, is mentioned by several good authors: the celebrated baron de Montesquieu, treating of this custom in his excellent work, entitled, *The Spirit of laws*, thus accounts for its origin: "The nairs are the tribe of nobles, who are the soldiers of all those nations. In Europe soldiers are forbid to marry: in Malabar, where the climate requires greater indulgence, they are satisfied with rendering marriage as little burthenome as possible; they give a wife amongst many men, which consequently diminishes the attachment to a family, and the cares of house-keeping, and leaves them in the free possession of a military spirit."

S E C T. XI.

Of the Marriages of the Gentoos in general; the Behaviour of the Women; their early Pregnancy; and their Management of their Children. Of the Funerals of the Gentoos, and the Womens burning themselves on the Funeral-pile of their Husbands.

NOTHING can be more public and splendid than the solemnization of the marriages of the Gentoos; the little bride and bridegroom, who are frequently no more than three or four years of age, are carried thro' the streets for several nights successively, dressed in the richest cloaths, and adorned with the finest jewels their parents can procure; at the same time the streets are rendered as light as day, by the great number of torches lighted upon the occasion: and they are preceded by flags, streamers, wind-music, and a crowd of their friends, who come to express their joy upon the happy occasion; which was not determined before the astrologer was consulted, and the fortunate hour fixed. After the bride and bridegroom have finished their pompous cavalcade, they are taken to the house where the father of the little wife lives, and being seated opposite to each other, with a table between them, they stretch out their hands, and having joined them across the table the priest covers both their heads with a kind of hood, which remains spread over them about a quarter of an hour, during which time he prays for their happiness, and gives them the nuptial benediction; after which their heads are uncovered, and all the company sprinkled with rose-water and perfumes out of silver cruets; till their cloaths are wet and discoloured with the saffron with which they are mixed; and thus they are worn for a week after, to shew that they have been at one of these joyful meetings. The evening concludes with a magnificent entertainment suitable to the quality and wealth of the parents, and sometimes these festivals last several days.

The Gentoos, though frugal in every other article of life, are so very extravagant on these occasions, that some of them almost ruin themselves, and lavish away upon their childrens nuptials what would be a handsome provision for the married couple when grown up; for they spare no expence in processions, music, dancing-girls, fire-works, feasting, and the ornaments of their houses, endeavouring in every thing to outvie each other; it being a matter of ambition with them to have it said how much was expended at a son's wedding: and as the presence of the Bramins are necessary in the performance of the ceremony, they come in for a share of the entertainment and presents. Some of the great merchants at Bengal have been known to spend a lack of roupees, which amounts to about twelve thousand pounds; and, besides making considerable presents, have invited the English gentlemen to an entertainment, furnished in the English manner, under the direction of an English steward, for which they have allowed five hundred pounds. In short, most of them, upon these occasions, stretch their abilities.

The Gentoos women treat their husbands with extraordinary respect and tenderness; their conduct is in general

neral blameless, and very few are ever known to violate the marriage-bed. They are intirely in the power of their husbands, to whom they bring no other fortune besides their cloaths, and perhaps two or three female slaves; and, among the wealthy, it is said the father of the husband advances a considerable sum to the wife's friends: so that she is in a manner purchased, like the rest of his household goods; but they have a greater liberty of going abroad than the Mahometans, at least the tradesmen's wives and those of the other inferior casts, go constantly in the morning and evening, with their earthen-pots, to the common wells, to fetch water to wash themselves, which they do several times a day from head to foot. Mr. Ovington says, a merry Banyan used often to complain of the folly of having two wives, because they distracted him with their perpetual jealousy of each other, and he never could enjoy one without displeasing the other. Upon the least suspicion of his intending to favour one, the other was alarmed, and would break out into the most passionate expostulations, asking if he intended to forsake her, and taking hold of his cloaths would partly by force, and partly by the tenderest expressions she could frame, endeavour to divert him from his design. One would urge that she was the wife of his youth, with whom he had long contracted an intimate acquaintance, and plead a right to him by prescription: the other would claim a greater share in his favours, on account of her having yet enjoyed so little of them, but that her rival had him to herself for several years. Thus the husband, distracted by their importunity, knew not which way to turn, and wished, for his own tranquillity, he had confined himself to one. Indeed, the Bramins and Banyans generally content themselves with one wife, except she is found upon experience to be barren, which is esteemed a great misfortune and reproach; but this is, however, very rarely the case: some of the other tribes of the Gentoos allow themselves a greater latitude.

The women begin to bear children at twelve years of age, and even much younger, for Mr. Grose says he has seen them pregnant in their tenth year; but then their teeming-time is soon over. They seldom have any children after they are thirty years of age, and frequently before that time they intirely lose their bloom, and all that plumpness and delicacy for which they are justly remarkable. This is, however, not to be understood of the women brought from Cashmere, who being born in a more northern climate, and in a purer air, amongst the mountains bordering on North-east Tartary, retain their charms and continue prolific as long at least as any European women; but these generally fall to the share of the principal Moors or Moguls.

When a child is about ten days old, they give it a name. On this occasion they assemble ten or a dozen children, who standing in a ring hold a sheet in their hands, into which the Bramin, or priest, pours a quantity of rice, upon which he lays the child to be named. The boys who hold the sheet shake the child and the rice together for about a quarter of an hour, and then the father's sister advances and names the child, custom having given her that right; but if the aunt be not present, the child is named by the father or mother. A month or two afterwards the child, it is said, is carried to a pagoda, where a Bramin mixes some shavings of sandal-wood, camphire, cloves, and other things, and puts them upon the child's head, from which time the infant is reputed a complete Banyan.

The lying-in women are thought so impure, that none must touch them for the first ten days but their nurses; and till forty days are expired, they must neither have any hand in the dressing provisions, or in the performance of any other household affairs.

The Indians never bind or swathe their children, but both their boys and girls go perfectly naked till they can run about, while infants, they are rocked in cradles fastened to the beam of the house, when being swung backwards and forwards, go much easier and quieter than ours that stand upon the floor.

We shall now take notice of the funerals of the Gentoos, some of whom bury the body, and others burn it; but this last is the most common. As Mr. Grose was

present at both these ceremonies when at Bombay, we shall take our account from him, his veracity being undisputed. The first he mentions was a Ketteree that buried his wife, who was a young woman, and seemed to be about twenty years of age. Those who accompanied the husband dug a pit exactly in the shape of a well, on one side of which was a niche hollowed out for the corpse to be deposited in a sitting posture, with room sufficient for a plate of raw rice and a jar of water by her side. The pit was no sooner ready than they put her into it with all her cloaths and jewels, exactly as she wore them when alive. But as soon as she was placed, her husband, who till then had stood still as a spectator, jumped into the grave, and very composedly took off all her jewels and brought them up with him; after which the pit was filled up.

As to the ceremony of burning; having washed the corpse, and dressed it in such cloaths as he usually wore in his life-time, the relations and friends assemble and carry it out on a bier to a little distance from the town. This is usually done the next day; but if a person dies in the morning, his body is sometimes burnt the same evening, for a corpse will not keep long in these hot countries. The funeral-pile is usually prepared near some river, or pond; and if he be a person of wealth, great quantities of fragrant wood is mixed with the rest that forms the pile. Mr. Grose saw the ceremony performed on the corpse of a youth about eighteen, the son of a Banyan. The funeral-pile was prepared on the beach, the father assisting at it bare headed, with the little cloaths he had on, coarse and torn, which is their general manner of mourning. As soon as the corpse is placed on the pile, and some prayers muttered by the attendant Bramin, fire is set to it at one of the corners; and the wood being dry, and in a great quantity, it soon blazed up and consumed the body to ashes, without any noisome smell: such, however, does not unfrequently happen, if there is but little wood, or the rain intervenes, to damp the flames. The ashes are gathered together and thrown with ceremony into the sea by a Bramin, who, for that purpose, wades into it as far as he safely can; but those who are most bigotted, and can afford the expence, leave orders for their ashes to be collected, put into an urn, sealed up, and carried to be thrown into the Ganges, to whose waters they attribute a peculiar sanctity. But what drew my attention most, says the above author, in the course of this ceremony, was the behaviour of the father, who, according to the Gentoocustom of its being always the next and dearest male relation that sets fire to the pile, walked thrice round it, with a sort of desperate haste, and then, with his face averted, thrust his hand behind him and gave fire to it; after which he, with the appearance of the utmost agonies, rolled himself in the sand, beating his breast and tearing his flesh.

Few travellers who have passed through India omit mentioning the cruel custom of the women publicly burning themselves at the death of their husbands, which is said to be still practised in some places, though the Moguls have endeavoured to abolish it, and strictly prohibit its ever being performed.

Mandello, a traveller of great learning and acknowledged veracity, when at Guzarat, was present at one of these funeral rites, of which he gives the following description. "A young woman twenty years of age, having been informed that her spouse had died at two hundred leagues distance, resolved to celebrate his obsequies by burning herself alive. In vain was it represented to her, that the news was uncertain; nothing was capable of making her change the resolution she had taken. We saw her arrive at the place of her suffering with so extraordinary a gaiety and confidence, that I was persuaded she had stupified her senses with opium. At the head of the retinue which accompanied her was a band of the country music, composed of hautboys and kettle-drums. After that came several married women and maids singing and dancing before the widow, who was dressed in her richest cloaths, and had her neck, fingers, arms, and legs, loaded with rich jewels and bracelets. A troop of men, women, and children followed, and closed the

"pro-

“ procession. She had washed herself before in the
 “ river, that she might join her husband without any
 “ defilement or stain. The funeral-pile was made of
 “ apricot-wood, with which they had mixed branches
 “ of sandal and cinnamon. She beheld it from afar with
 “ contempt, and approached it without being disturbed :
 “ she took leave of her friends and relations, and distri-
 “ buted her ornaments amongst them. I kept myself
 “ near her on horseback, along with two English mer-
 “ chants. Judging, perhaps, by my countenance, that
 “ I was sorry for her, to comfort me she threw me one
 “ of her bracelets, which I luckily caught hold of.
 “ When she was seated on the top of the pile they set
 “ fire to it, and she poured on her head a vessel of sweet-
 “ smelling oil, which the flame immediately seized on :
 “ thus she was stifled in a moment, without being ob-
 “ served to alter her countenance. Some of the assistants
 “ threw in several cruses of oil to increase the fire, and
 “ filled the air with frightful cries. When she was
 “ entirely consumed, her ashes were thrown into the
 “ river.”

Mr. Hamilton says he has seen the ceremony perform-
 ed several ways ; he adds, they sometimes dig a pit about
 ten feet long, and six broad, which they fill with logs of
 wood ; and when all is ready, a great quantity of oil, or
 the Indian liquid butter, is thrown on the wood. The
 corpse of the husband is then placed on the middle of the
 pile, and fire being set to it, it is instantly in a blaze.
 The wife then takes leave of her friends, and the drums,
 trumpets and other instruments striking up, she walks
 two or three times round the pile, and then leaps in upon
 the corpse.

In other parts, he observes, they use no pits, but a pile
 being built, the corpse is laid upon it, and the victim
 dancing round it for some time to the sound of loud mu-
 sic, leaps in ; and if she hesitates, the priests push her
 forward with long poles, making such a hideous noise
 that she cannot be heard ; and all the while she is burn-
 ing the priests dance round the fire. I heard a story, he
 adds, of a lady, who having received the addresses of a
 gentleman that afterwards deserted her, was obliged by her
 relations to marry another ; who dying soon after the mar-
 riage, she was, according to custom, to be laid on his fu-
 neral-pile. The fire being kindled, she was preparing to
 act the tragedy on herself, when observing her former ad-
 mirer, she beckoned him to come to her. This he did,
 when taking him in her arms, as if to embrace him, and
 being stronger than he, she rushed with him into the
 flames, and they were both consumed with the corpse of
 her husband.

It has been pretended that this inhuman custom was in-
 troduced by the Indian Gentoos, to put a stop to the cruel-
 ties of their wives, who, from jealousy, frequently poi-
 soned their husbands. Mr. Giose, however, maintains
 this opinion is an over-refinement of conjecture equally
 false and injurious to the Indian women, no such practice
 being either related by credible tradition, or warranted by
 the behaviour of the other Indian women, who are not
 subject to the necessity of complying with this custom, and
 whose minds are generally too soft and tender to incur
 even the suspicion of their being inclined to such acts of
 cruelty. He attributes it to their prodigious affection and
 veneration for their husbands, and the dreadful power of
 religious phrenzy.

Their extreme fondness for their husbands, says he, is
 owing to their early marriage, after which the parties in
 the tenderness of the ductile age of childhood are brought
 up till that of consummation, in the constant inculcation
 to them of mutual dearness, as a sacred point of religion ;
 and the women especially retain such strong impressions
 of this doctrine, that numbers of them readily embrace
 this cruel practice of burning themselves with their hus-
 bands. Some of them living under governments where
 this barbarous act of superstition was not suffered, have
 voluntarily gone to Gentoo countries barely to enjoy
 the liberty of performing it. Others, after bringing up
 their young children to a state of maturity, which it
 seems is an allowable reason of dispensation with them,
 and many years after the death of their husbands, have,
 as if they had endured life only till that duty to their
 children was fulfilled, paid that to their deceased hus-

bands of seeking to rejoin them by burning themselves
 with the usual ceremony. Some, indeed, who have not the
 courage either to undergo that fate, or the patience to en-
 dure the indignities and slights that fall upon those who
 decline it, such as cutting off their hair, which to them
 is the most intolerable of all pains, servile offices, and
 wearing a particular coloured garment of a dingy red ; will,
 especially if they meet with encouragement, turn Chris-
 tians or Mahometans. It must not, however, be under-
 stood that this practice of voluntarily burning is very ge-
 neral, many of the lower tribes especially are entirely ex-
 empted from it ; and it is only with respect to the more
 considerable personages that it is ever used, and even a-
 mongst them the instances begin to be much rarer, and
 that point to be less insisted on.

We shall now take an impartial view of the religion of
 the Gentoos, and Parsees, or worshippers of fire.

S E C T. XII.

Of the Religion of the Gentoos.

THOUGH the religion of the Gentoos is at bottom
 every where nearly the same, yet in the different
 parts of Indostan such various modes of opinion and prac-
 tice are built upon it, as would require many volumes to
 specify the differences by which they are distinguished ;
 we shall therefore only mention such as appear the most
 remarkable and striking.

Nothing seems more astonishing than the extreme te-
 naciousness of the Gentoos in their religion and customs,
 while, at the same time, they behave with the most per-
 fect humanity, and give an unbounded toleration to those
 that differ from them in points which they esteem the most
 sacred. This is doubtless owing to that fundamental tenet
 of their religion, that a diversity of modes of worship is
 evidently agreeable to the God of the universe : that all
 the prayers put up to him by man are equally acceptable,
 when sanctified by the sincerity of the intention ; and that
 the true universal religion being only that of the heart,
 the various outward forms of it are in themselves indif-
 ferent, and that therefore all change of religion is only a
 dangerous, and needless experiment, since every honest
 man is sure to be saved in his own. Hence, instead
 of persecuting others for not being of their religion, they
 will admit of no profelytes ; and though whole nations
 have adopted their principal tenets, as for instance, the
 vulgar among the Chinese, who believe the transmigra-
 tion of souls, and follow their idol worship, they neither
 admit of a community, or hold any correspondence with
 them, and would as soon sit down to eat, or intermarry
 with Christians or Mahometans, as with those of their own
 religion in China. Even when any of their religion re-
 nounce it, though it be in countries where they are mas-
 ters, they have the charity to suppose it was through a
 conscientious persuasion, and never persecute them any far-
 ther, than by cutting off all communion with them, and
 irrevocably expelling them from the cast or tribe in which
 they were born, after which they content themselves with
 only pitying them.

Nothing shews this tolerating spirit in a stronger light,
 than their behaviour to those who differ from them in
 their treatment of cows, or of that species in general.
 For these animals they have a most superstitious veneration,
 though the spirit of the law which forbids their
 being slaughtered, seems chiefly founded in gratitude, as
 their killing a creature so serviceable to mankind both in
 agriculture, and in furnishing so innocent a diet as milk,
 butter, and cheese, would, they think, be extremely cruel.
 They, however, annex a general sanctity to every thing
 produced by that animal ; they purify themselves with its
 urine, and burning the excrements into a greyish pow-
 der, sprinkle it on their foreheads, breasts, and bellies :
 also when the dung is fresh made, they smear their houses
 and pavements with it as a kind of lustration. In short,
 their veneration for that animal is so excessive, that there
 could hardly be found a Gentoo, who, if under the ne-
 cessity of killing his father, mother, child, or a cow,
 would not, with scarce any hesitation, prefer sacrificing
 any, or all of the former. Yet with this strange reli-
 gious

gious horror for the slaying of these creatures, they have not the least aversion or ill-will to those who do. They scruple neither conversation, nor even friendship for those who use them for their food; and this merely from their enlarged notions, and allowance for the difference of religions. Indeed in some countries immediately under the dominion of Gentoos, they do not permit the openly killing of cows, though they will wink hard not to see it.

This principle of tenderness is, however, not confined to the horned species alone: their belief of the metempsychosis makes them extend it to every living creature, none being of so low a class or so minute, but they imagine it may be the receptacle of a human soul, and consequently of their relations or friends. Hence that difference of size, which is apt to affect the eye with contempt or regard, and lessens or augments compassion to an animal in the act of destroying it, has no such effect upon them. They cannot without horror think of depriving any being of that precious gift of God, life; and do not less respect it in the flea that bites them, than in the elephant. But this is only to be understood of the Bramins, Banyans, and some other of their stricter tribes.

Authors mention several reasons, besides that just mentioned, for the veneration they pay to these animals: as that the happiest souls take up their abode in them, and that after death this beast is to conduct the people over a great river, which it would be impossible to pass without holding by her tail. They also alledge, that the god Mahadeu being highly provoked by the sins of the people, and resolving to destroy the world, was appeased by a cow.

The Banyans not only forbear to kill any living creature, but erect hospitals for them, particularly within a mile of Surat, the cows, horses, goats, and dogs that happen to be lame or enfeebled by age, are plentifully provided for; and they will purchase a lame ox of his Mahometan or Christian owner to prevent his being killed by his master. The Banyans also once a year prepare an entertainment for the flies, setting before them large dishes of milk and sugar; and at other times they take a bag of rice, and walking out two or three miles, scatter the rice round the ant-hills.

Indeed, the Banyans are so firmly persuaded that departed souls enter the bodies of animals, that they no sooner observe any of them frequent their houses, but they immediately conclude it is some of their deceased friends come to pay them a visit. Thus it is said, that a person named Moradash, who was secretary to an English broker, being very melancholy on the death of his father, and seeing a snake enter his house, immediately concluded it was animated by his father's soul, and came thither for relief. This thought gave him no small comfort, and he resolved to pay the same duty to his father under this metamorphosis, as when he was alive; and therefore provided milk and rice for his new guest, who liked his entertainment so well, that he took up his dwelling in a corner of the room, and came out to eat, when his food was set him, as regularly as if he was one of the family. The same man made a provision for the rats in his house, from his persuading himself, that they were his relations; upon which they grew as tame as any other domestic animals.

But ridiculous as this may appear, it is a fault less excusable than the barbarous treatment animals meet with from the most civilized European nations; for surely nothing can excuse the taking away their lives from mere wantonness, and without any advantage to ourselves. Life is certainly a blessing of the greatest value, and perhaps more so to animals than to us, since they enjoy all the satisfaction of which their natures are capable, and taste their pleasures unmixed with care, and unallayed with apprehensions of futurity. They were doubtless created by the benevolent and all-wise Creator for happiness as well as for the use of man; and to deprive them of that is to defeat, as much as is in our power, the designs of his infinite goodness. But to use those animals ill, which contribute to our convenience, and serve us by their labour, is adding baseness and ingra-

atitude to cruelty; and putting those animals to a painful and lingering death, which nature designed for our food, by barbarously scourging and roasting them alive, in order to give a relish to their flesh, and indulge our appetites with a more delicious regale, is acting beneath the character of human and rational beings, and offering a more than savage insult to him who bestows those refreshments, and whose goodness extends to all his works.

According to the popish missionaries, the Bramins teach that there is but one God, infinitely perfect, who has existed from all eternity, but that he created three subordinate deities, Brama, Wislnow, and Routeren. To Brama he gave the power of creation; to Wislnow that of preservation; and to Routeren that of destroying; but they observe, that the wiser Indians reject this account, and ascribe all to the Supreme Being, who by these several ways has manifested himself to the world; and maintain, that some of their images are allegorical representations of his attributes, though the greatest number of them, perhaps represent those persons distinguished by their virtue and piety, who being exalted to heaven, they suppose to be mediators for them to the great Supreme. They have also some confused notion of the creation and destruction of mankind by a flood, which probably gave a hint to the Jesuits to improve upon the hint, by representing Brama as Abraham, and endeavouring to shew a particular conformity between the traditions of the Gentoos, and many of the principal passages recorded in the Old Testament.

The Bramins maintain that Brama received from Mahadeu the power to make several worlds, and that he formed fourteen at least. To our world they assign four several ages, the duration of each of which they suppose lasted several hundred thousand years; and the present age has yet upwards of four hundred thousand years to come before it be finished.

They have ten principal images, which are the objects of their adoration, and represent such figures as, according to their sacred book the Vedam, their god Mahadeu was at several times pleased to assume for the service of mankind. They have idols in which he is represented with four heads, and as many arms; in others he has a head like an elephant, with the body of a man, and several arms and hands: and a protestant divine relates, that a bramin told him, they acknowledged one God, whom they described as having a thousand eyes, and as many hands and feet, by which they endeavoured to express his omniscience and power.

They have seldom any public assemblies in their pagodas, but every one performs his devotions when he thinks fit, and to which of the images he pleases. The greatest part of their worship seems to consist in singing, dancing, playing on musical instruments, and in making offerings of rice and other food; but a late author says, he has seen the people at Madras praying before the shrines of their gods with all the fervent devotion which a sense of their wants can be supposed to inspire.

Their gioghies, who are a kind of wandering Bramins, seem descended from the ancient Gymnosophists; but, like other human institutions, have been at length vitiated by abuses, hypocrisy, and the admission of corrupt members. Their original regulation includes a renunciation of the world, an itinerant life, and that perfect nakedness from whence they derived their Greek name. At present, when they occasionally travel into countries under the jurisdictions of the Christians or Moors, they dispense with this last precept; and, out of deference to their customs, wear a scanty rag that scarce covers the parts to which their own opinions annex no idea of shame. As to those painful postures, and other cruelties they impose on themselves, a learned and ingenious author says, they do not mean by them to insinuate that any torments of the creature can be acceptable to its Creator, but purely for the sake of the merit they apprehend arises from the intenseness and constancy of their spiritual contemplation of the Deity being sufficient to call off their attention to bodily pain, and their fixing it immovably on the only idea which they imagine can worthily fill the mind.

Authors

Authors have given very strange and dreadful representations of these self-martyrizing postures, and describe them as voluntarily distorting and dislocating their bones. Some are seen with their hands stretched out to heaven, which, by holding long in that posture, they cannot bring down again without great violence. Others, it is said, make a vow never to sit or lie down, but either walk or lean; accordingly a rope being tied from one bough of a tree to another, a pillow or quilt is laid upon it, on which they lean; but these are said to alter their posture when they pray, being drawn up by the heels to the bough of the tree, their heads hanging down towards the earth as unworthy to look up to heaven. From the prayers of these people great blessings are expected, and many calamities thought to be averted. The people resort with much devotion to the places where those penances are performed; and the devotees, by torturing their bodies, obtain the reputation of great sanctity.

Mr. Grose mentions one of these Gioghies, who erected a small pagoda out of the alms and voluntary donations he collected from the Gentoos of the island. This man, on his arrival at Bombay, was about five and thirty years of age, tall, straight, and well made; and, by his own account, had been all over Tartary, Tibet, and on the borders of China, and at length took Bombay in his rounds, where, according to his institution, he ought to have been perfectly naked; yet, out of deference to our manners, just covered those parts which the common ideas of decency oblige us to conceal; and yet not so much, but that there might plainly be seen a brafs ring passed through the prepuce, which to those of his profession performs the same office as a padlock to the Italian ladies. His hair, which was twice the length of his body, and reaching down to his heels and thence again to the crown of his head, was wreathed in rolls round, and rose in a kind of spire of a russet colour, into which it was sun burnt from its original black. On his arrival at Bombay he addressed himself solely to the Gentoos for money to found a small pagoda; but his scheme for exciting their devotion was something extraordinary. He preached to them from the midst of a great fire which surrounded him, and had something of a miraculous appearance, though there was nothing in it but what was very natural. He had a platform of earth raised about two feet, and about twelve or fourteen feet square; round this was set a pile of wood, which being lighted, made him appear as if preaching from amidst the flames, though they never touched him; but must have been insupportable to any one but himself, who had from his childhood inured himself by degrees to bear such a heat. This device, however, had its effect, for it produced a collection at several times to the amount of what he required.

It is also in the character of contemplatists, that they prove what is perhaps harder to attain, an insensibility to pleasure. Thus some of them will sit by the side of the banks, where the Gentoos women perform their ablutions, and suffer them to salute, with the utmost reverence and simplicity, what they exhibit for that purpose, while their eyes roll frightfully in their heads, and no symptom or gesture betrays the least indication of human feeling, sensual emotion, or attention to the sight or touch of those females, who have formed an idea that there is great prolific virtue in this strange act of adoration. They have generally, like the person just mentioned, that part bored, with a smooth soldered ring passed through it, as an attestation that incontinence with them is impracticable. The Gentoos, to whom the abuses of this profession are perfectly known, and who have been put on their guard by the impostures they have committed, still retain the highest veneration for those whom they think sincere in the exercise of the torments they inflict upon themselves, and even pretend to produce, in excuse for this branch of bigotry, a number of miracles performed by these Gioghies.

Mr. Grose, speaking of the mendicant friars, says, "they seem but a copy, and a wretched one too, of these mendicant Gioghies, whose abstinence from all animal food, contemplative life, austerities, and macerations, far exceed whatever their most famous

"ascetics ever so much as attempted. From them too, he adds, the Mahometans borrowed the institution of Faquits, or holy beggars; so that both Europe and Asia owe all that swarm of vermin, the monks of both those religions, to a perverted imitation of the Gentoos religion in that point."

There are many reasons, says the above author, to think the Gentoos religion one of the most ancient in the world: nothing of so remote an original can be reasonably suspected of borrowing from others, especially among a people who have ever made it a sacred point to follow their own peculiar institutions without deigning to admit of any foreign mixture. It is then highly probable, that the doctrine of the metempsychosis, by which Pythagoras was so particularly distinguished, was derived from them, with many other articles and modes of worship and opinion, which, from certain resemblances, might be traced from the same source. Thus, among many other conjectural instances, may be quoted the Paphian Venus; for the form of which Tacitus could not account, it rising from a broad basis to a narrow point at the top, which is exactly the figure of the idol in India consecrated to such an office as that heathen deity was supposed to preside over, and to which, on the borders of the Ganges, the Gentoos virgins are brought to undergo a kind of superficial defloration, before they are delivered up to their husbands.

This idol, which is worshipped by the Gentoos under the name of Jaggernaut, is represented by captain Hamilton as a pyramidal black stone, fabled to have fallen from heaven, or at least to have miraculously appeared in the place where they have erected his temple. It appears that this stone, of which all the images of that form in India are esteemed but copies, is meant for the power presiding over universal generation, which they attribute to the genial heat and influence of the sun acting in subordination to it, and to whom is addressed the following prayer, which the Bramins especially often repeat in a day, with their eyes lifted up towards the sun: "Thou, power, which illuminates that resplendent orb, deign also to illuminate my mind, so as that I may thereby be directed to walk in the way the most pleasing to thee."

Now considering the dignity which the ideas of the Gentoos attach to the generative power, it is no derogation to the supremacy attributed to Jaggernaut, by their making his temple and image the head place of their worship, to infer, that he is their god Brama under that title, just as Jupiter had several names, according to his various functions, and equivalent to the Mythras or Venus Urania of the Persians, or simply the Venus of the heathens. The Gentoos inhabitants on the banks of the Ganges form domestic idols after that of Jaggernaut, to which they give its name, and which are placed in a conveyance decorated with gilding and tinsel, that is to serve them for a triumphal car. Formerly this idol used to be adorned with jewels and expensive finery, according to the circumstances of the owner; but of late they are much abated on that point. This machine is kept for some days in the best apartment of the house, during which time it is matter of devotion with them to exhibit the most obscene postures, and to act all manner of lasciviousness before the idol, as the most acceptable mode of worship to the deity it represents. After which they carry it in its gilded car in a procession to the Ganges, and throw all in together, as an acknowledgment to that river of its congenial fertilization with that of the sun.

As to the cause of the Gentoos choosing this pyramidal form, it seems lost in the remotest antiquity. But might I be allowed, says our ingenious author, to hazard a conjecture, it should be that it was originally suggested to them by that pyramidal aspiration of flame, which is one of the most conspicuous properties of fire.

S E C T. XIII.

Of the Ordeal Trials practised by the Gentoos.

THE ordeal trials of melted lead, or boiling oil, as practised here, are considered by the Gentoos as a standing miracle; and, according to Mr. Grose, they

are not managed by the least degree of priestcraft, unless it could be supposed combined with the whole governing laity against the interest of justice and their own, it having been practised for ages through the various provinces, particularly of the Malabar coast, as the criterions of innocence. Several of the English chiefs of the settlements of that coast are said to have used the utmost care and precaution to detect whatever fraud might be found in this method of trial. They have caused the party that was to undergo it not only to be locked up in their own guard-room, or prison, but seen the hand that was to be plunged into melted lead, or oil, bound up with a handkerchief, closely tied round the wrist, and sealed with their own seals, which remained unbroke till the instant of the public ceremony; and, notwithstanding this, and every other precaution which the most determined incredulity and suspicion of fraud could devise, they were unable to discover that there was any trick or juggle in it. Indeed there is the highest improbability that so many princes of different dominions and interests should for many ages join in a cheat, only to screen obnoxious criminals, and to baffle that justice by which alone any government can subsist.

The ceremony is performed with great solemnity. The party who has appealed to this trial for his innocence, whether on suspicion of murder, theft, conjugal infidelity in the women, or even in denying a debt, is publicly brought to the side of the fire, on which is a cauldron, or ladle-full of boiling water, or oil, but most commonly melted lead: the prince or magistrates of the country being present, his hand is previously clean washed, and a leaf of the brab-tree, with the accusation written upon it, is girt round his waist; and then, on a solemn invocation of the Deity by a Bramin, the person plunges in his hand, scoops up the boiling fluid, and if he draws it out unhurt is absolved, otherwise he receives the punishment prescribed by the laws for the crime on which the accusation lay; and so firmly believed is this method of purgation on that coast, that our author says, he has been assured, that even some of the Indian Christians and Moors have voluntarily submitted their cause to its decision on their own personal experiment.

Mr. Grose, from whom we have borrowed this article, on account of his having treated the subject in a fuller and more curious manner, concludes with the following observation: "As the princes of those countries, where this custom stands at this day in full force, use no sort of reserve, or refuse any examination that might be required, certain it is, that, on the least intimation from any person of authority here to any of the English gentlemen on that coast, such an enquiry would be very readily set on foot, as would satisfactorily liquidate what truth and falsehood there is in this practice; and the issue must be, since the fact is incontrovertibly true, either to discover a natural method of resisting fire, far more subtle than what is known to our European jugglers, or to prove that Divine Providence, when solemnly appealed to, does not disdain its immediate interposition in favour of innocence; an act which, though not unworthy of the goodness of God, the Romish priests in those parts, not denying that the effect produced is supernatural, attribute it to the power and craft of the devil: but with what propriety let any one judge."

SECT. XIV.

Of the Religion of the Parsees.

THERE seems to be two distinctions necessary to be made in the religion of the Parsees, or Gaures, who transplanted themselves from Persia when the Mahometans conquered that country: the first, the pure religion, as taught by Zoroaster; and the second, and more modern one, disfigured by various adulterations, as it is at present practised among the Parsees of India and Persia.

Zoroaster flourished under the reign of Hytaspes, king of Persia, about five hundred years before the birth of

our Saviour, and was profoundly versed in the mathematics and natural philosophy, whence he probably drew those sublime notions in relation to fire, on which he founded the basis of his religion, and which his followers still retain.

It is however evident, that he found an homage paid to that element already established in that country, since Pyraums or conservatories of perennial fire were known to be there long before his time; but whether that worship of it was a religious act, or whatever it was, it was accompanied with such idolatry that Zoroaster employed himself in purging it of its gross errors, and reducing it to the two grand points on which he founded his religion. The belief of one supreme God, and of the sun or element of fire being his first minister, and also the symbol of his purity; from these principles the rest of his opinions flowed.

Some writers observe, that there were two Zoroasters; and that the last, arising six hundred years after the first, explained and new modelled this religion, which he stripped of the errors and superstitious practices by which it had been disfigured.

However, agreeable to the above doctrine, the followers of Zoroaster are still so penetrated with the idea of the immensity and omnipresence of God, that they esteem it a proof of great narrowness of sentiment to erect temples to him, as conveying the grovelling idea of confining him who fills all space between four walls; hence they make use of that celebrated saying, that "There is no temple worthy of the majesty of God, except the whole universe, and the heart of an honest man." Of all their opinions, they esteem that most sacred, that God was the sole necessary self-existent being from all eternity, and is the supreme Author of all good. Hence they detest the schism of those Persians who admit the co-eternity of the two principles of good and evil, and all the absurdities of Manicheism.

Without entering into a minute detail of their manner of accounting for the appearances of evil found in the world, it is sufficient to observe, that they maintain, that since many effects in nature, which at the first view appear to be evils, are justified as to the wisdom of their causes, by their ultimately issuing in a known superior good, it is just that we should believe that all the rest are so, though their ends probably, for very wise reasons, are concealed from us. Hence they alledge, that it is the utmost rashness and impiety to infer absolute evil from some individuals occasionally appearing to suffer, from those primordial laws to which God has subjected all his works in general, without excepting man, whose good has been as much consulted as was fitting it should be, of which God ought surely to be esteemed a competent judge. Hence they deny that omnipotence has introduced real evil into nature; and maintain, that no evil actually exists but what is imaginary, temporary, and bearing no proportion to real, infinite, and eternal goodness, and therefore not incompatible with it.

As to fire, they place its source in the sun, to which they pay a very high reverence, out of gratitude for the numerous benefits that flow from it; but they are so far from confounding the subordination of the servant with the majesty of the Creator, that they attribute no degree of sense to the sun, or fire, in any of its operations; but consider it as a purely, passive, blind instrument, directed and governed by its Creator. They even give that luminary, all glorious as it is, no more than the second rank among his works, reserving the first for that stupendous production of divine power, the mind of man.

They believe the immortality of the soul, and found the doctrine of rewards and punishments in the other life on the light of reason, which enables them to perceive the difference between right and wrong; or, to speak in their figurative style, the conflict between Oroozm the good principle, and Harryman the evil one; or between the flesh and the purer spirit. As to their punishments, they exclude material burning from being any part of them, and esteem the element of fire too pure, and too noble, to be employed in the office of an executioner. They even pretend, that the fire of divine

love

The Ordeal Trial practised by the Gentoo's.

love will moderate the punishments inflicted by justice.

The modern Parsees represent the place of suffering as a dark, dreary, disconsolate region, where every thing is big with horror, pain, and disgust; caverns abounding with serpents, water thick like melted pitch, and cold as snow. They do not, however, believe them to be eternal, but imagine that the guilty sufferers will be at length delivered, when they will be placed in a state of bliss, but inferior to that of the good, from whom they will also be distinguished by a brand in their foreheads. In fine, they imagine that both in degree and duration these punishments will be proportioned to human frailty; but that rewards, like the Divine goodness, will be infinite and unbounded.

Such was the doctrine of Zoroaster, as may still be collected from the adulterations it has since undergone; for the religion of that great man was too simple to satisfy the gross conceptions of the vulgar, or to answer the lucrative views of the chief Magi, now known in India by the name of dostoors, or directors of their ritual. A number of years being elapsed since the death of Zoroaster, his religion was no longer suffered to continue in its original purity. His books had been lost, and the present work, called, *The Zendavastaw*, was wrote in the same old Persian language by Erda Viraph, one of the chief Magi, who pretended to compile it by memory from the antient work, and of this a translation has been made into the modern Persian by a person who lived about two hundred and sixty years ago, and intitled it *Saad-dir*, or the Hundred Gates. These works seem to have greatly sophisticated the original doctrine by interpolations, and introducing superstitious that have greatly disfigured the religion of Zoroaster. Hence, they dare not be a moment without their girdle; and pay such a superstitious reverence to fire, as not to venture to pray before it without covering their mouths with a square flap of linen, lest they should pollute the fire by breathing on it. They still keep pyraums, or conservatories of fire, in which lamps are kept continually burning, by being fed with oil by the priests who constantly attend them; and, as they relate, have burnt, without ever being extinguished, for many centuries.

Yet, notwithstanding the superstitious follies ingrafted on the original stock of this religion, such, continues our author, has been the force of its sap, as to prevent the fruit from being spoiled; for even at present the Parsees are remarkably distinguished by the purity and innocence of their morals, and no people in general behave better either in public or private life.

It is said that the greatest honour these people think they can do to the remains of their deceased friends, is to expose them to be devoured by birds of prey; for these living tombs they esteem preferable to any other kind of sepulture. About a mile from the city of Surat they have a place to which they carry their dead; this is within a circular wall, open at the top, twelve feet high, and one hundred in circumference. The ground within is raised about four feet, and made sloping, that all the moisture may drain from the carcases into a sink made for that purpose; nothing can have a more shocking appearance than this burying-ground, as it is called, where are seen a multitude of dead bodies, loathsome and discoloured; some green, some yellow, some with their eyes torn out by the vultures, and some with all the flesh of their cheeks pulled off; great holes eaten in different parts of their bodies, and the skin all over torn and mangled. In short, some are hardened by the sun like a piece of tanned leather, while the flesh of others is clean picked from the bones, which remain like a skeleton. The vultures, it is observed, will place themselves down the wind, in order to enjoy the smell of these carcases; and sometimes cram themselves with human flesh till they are scarce able to fly.

S E C T. XV.

Of the Mahometans of India.

IT might be expected, that as the Mahometan religion is that of the court, we should here give a par-

ticular account of it; but this we shall reserve till we come to Persia, only observing, that it is practised here with less bigotry than among the Turks; and that, though a faint reverence is kept up for the name of Mahomet, it is rather a matter of habit than of devotion; and the fanaticism of the Mahometans being subsided into a sober common sense, they are become less troublesome to the Christians, and all religions live peaceably under their government.

They indeed seem to grow more purely Unitarians in proportion as their zeal for the more ceremonial part of their religion relaxes, nor will they so much as hear with patience any argument against that fundamental point of their religion, the unity of God, whose name alone they invoke at the hour of death, and generally die with it in their mouths; their distance from the country whence that religion sprang rendering them more indifferent to any mention of the name of Mahomet. Indeed most of his followers, as an ingenious author observes, carry their veneration for the Supreme Being so far, as not only never to mention the word Alla, or God, with the least irreverence, but think it in a manner blasphemous to praise or define a being whom they consider as so infinitely above all praise, definition, or comprehension. Thus they carry their scrupulosity to a superstitious length, and do not even approve of calling him good, righteous, merciful, from their thinking such epithets as superfluous and impertinent, as if one was emphatically to say of a man that he had a head, or any other members necessary to the human form: for they conceive it as profaning the name of God to associate it with human attributes or conceptions, and that nothing fills the idea due to that Being so well as the name itself, "a substantive singularly, " and for ever above the company of an adjective."

S E C T. XVI.

Of the Power and State of the Mogul, with a Description of the Festivals celebrated to his Honour. Of his Court, his Officers, and Women: his civil Government, and the Punishment inflicted on Criminals.

THE power of the Mogul is so despotic, that he has the sovereign disposal of the lives and effects of his subjects. His will is their only law; it decides all law suits, without any person's daring to dispute it, on pain of death. At his command alone the greatest lords are executed, their siefs, their lands, their posts, and offices are changed or taken from them. The highest officers of his empire are the prime vizier, which answers to the first minister; the treasurer; the chief of the eunuchs; the first secretary of state; the general of the elephants; the great master of the wardrobe, who has the care of the furniture, the tents, cloaths, and precious stones that are commonly used.

This prince usually appears at a window at sun-rising, when the lords of his court are obliged to attend in his apartment to pay him their homage; he also shews himself at mid-day to see the fight of the wild beasts, and in the evening also appears at a window, from which he sees the setting sun. He retires with that star amidst a multitude of drums, and the acclamations of the people, wishing him a long and happy life. No other persons are allowed to enter the palace but the rajas, or princes, and the great officers; who behave towards him with such veneration, that it is impossible to approach the most sacred things with more profound respect. All the discourse is accompanied with continual reverences. At taking leave they prostrate themselves before him: they put their hands upon their eyes, then on their breast, and lastly upon the earth, to shew that with respect to him they are only as dust and ashes. As they retire they wish him all manner of prosperity, and go backwards till they are out of sight.

In order to give some idea of the magnificence in which the Mogul appears, we shall here give Sir Thomas Roe's description of his dress at his going abroad; for though it be a long time since he was at that prince's court, and though he has lost much of his wealth and power,

power, since his being conquered by Nadir Sha, yet as the easterns seldom or never alter their fashions, the present Mogul may probably appear much in the same manner, though he may have fewer jewels, and some of them may be of less value. As he came out, says that ambassador, one girt on his sword, and another hung on his shield, covered with diamonds and rubies; another hung on his quiver with thirty arrows, and his bow in a case. On his head he wore a rich turban, in which was a plume of heron's feathers: on one side hung a ruby unset as big as a walnut, on the other a diamond as large; in the middle an emerald in the form of a heart, but much larger than the diamond and the ruby. His staff was wound about with a chain of large pearls, rubies, and diamonds drilled. About his neck he wore a chain of three strings of excellent pearl, the largest the ambassador had ever seen. Above his elbows he had bracelets set with diamonds, and on each side of his wrists three bracelets of several sorts, and upon almost every finger was a ring. His coat was of cloth of gold without sleeves, and underneath it he had a femain as fine as lawn, and on his feet he had a pair of buskins embroidered with pearl, the toes sharp and turned up. Thus armed, and thus dressed, he went into his coach, which was made so exactly like an English one the ambassador had presented him with a little before, that he could only distinguish it by its being covered with Persian velvet, embroidered with gold.

When this prince marches at the head of his army, goes a hunting, or retires to one of his country houses, he is accompanied by above ten thousand men; and about one hundred elephants, with housings of velvet and brocade, march at the head of this little army. Each elephant carries two men, one of whom governs him by touching his forehead with an iron hook, and the other holds a large banner of silk embroidered with gold and silver; each of the first eight carry a kettle-drum. In the middle of this troop the Mogul rides on a fine Persian horse, or in a chariot drawn by two white oxen, whose large spreading horns are adorned with gold, and sometimes he is carried by men in a splendid palanquin. His retinue is composed of the officers of his court, who are followed by five or six hundred elephants, camels, or chariots loaded with baggage.

Two solemn festivals are annually celebrated in the royal city to his honour. The first is held at the beginning of the new year, and lasts about eighteen days. Before the palace a theatre is erected fourteen feet high, fifty-six long, and forty broad, covered with rich tapestry, and surrounded by a balustrade. Near it is a structure of painted wood embellished with mother of pearl, in which some of the principal lords of the court seat themselves; though their tents are at the same time erected in the first court of the palace, where they strive to display all their riches and splendor. The Mogul anciently entered these tents, and took whatever he liked best; but for above a century past the prince accompanied by the seven first play-ministers ascends the theatre, and seating himself on a velvet cushion embroidered with gold and pearls, waits for the presents that are brought him, which he receives equally from the people and the grandees of his empire during the eighteen days that the ceremony lasts, and towards the conclusion of that time, distributes among them his bounties, consisting in places and dignities which he confers on those who have made him the most valuable presents. Tavernier says he saw him receive at one of these feasts above the value of thirty millions of livres in diamonds, rubies, emeralds, pearls, gold, silver, fine stuffs, elephants, camels, and horses.

The other festival is the anniversary of the Mogul's birth. He begins the day with all manner of diversions, which he breaks off, to wait upon the queen his mother, if she be yet alive, at her palace, and shews his gratitude to her, by causing the grandees of his empire to make her magnificent presents. After he has dined he dresses himself in his finest robes, covers himself with gold and jewels, and being rather loaded than adorned with riches, enters a superb pavilion, where he is attended by the principal lords of his court. He there finds the great scales, and the chains by which they are

suspended, both of massy gold adorned with jewels. In one of the scales he places himself, and the other is filled with gold, silver, jewels, pieces of silk, fine linen, cinnamon, mace, cloves, pepper, corn, pulse, and herbs, and an exact register is kept every year of the difference of his weight. It is a subject of great joy when he weighs one year more than another, and of as great concern if he be found to have fallen away.

This ceremony is succeeded by the greatest act of generosity, which the Mogul exhibits during the whole year. It consists in his giving to the poor some small pieces of money, and in throwing among the grandees, nuts, pistachios, almonds, and other fruit made of gold, but so small and so thin that a thousand of them are not worth more than seven or eight pilsols. After experiment made, a basin filled with those trifles was found not to exceed the value of ten crowns. Thus the liberality of this wealthy monarch on his birth-day amounts to no more than the pitiful sum of a hundred crowns. The festival concludes with his giving a magnificent supper to the lords of his court, with whom he passes the night in drinking.

The sons of the Mogul have the title of sultans, and his daughters of sultanas. The viceroys, or governors of provinces, are called nabobs. The next in degree, which answers to our nobility, have the title of khan, or cawn, as it is usually pronounced, and these are distinguished by names which they receive upon their advancement, as Asaph Khan the rich lord; Khan Khanna, lord of lords. The great military officers are named Omrahs, and one who has been general is called Mirza. The chief eunuchs have the post of treasurers, stewards, and the comptrollers of the household. The other great officers are the secretaries of state, the governors of the elephants, the master of the tents, and the keepers of the wardrobe, who are intrusted with the jewels.

The women of the seraglio are either wives or concubines, princesses of the blood, governesses, or slaves. Those called wives are contracted to the Mogul with much ceremony, and seldom exceed four; but the number of his concubines is uncertain, though they generally amount to above a thousand. The Mogul never marries the daughter of a foreign prince, but generally one of his own subjects, and sometimes advances the meanest slave to that dignity.

His first son by any of these wives is considered as the lawful heir to the empire, though the throne is usually possessed by him who has the longest sword, who no sooner ascends it, than he generally destroys all his brothers and their male issue.

The young sultans are married at thirteen or fourteen years of age, and then are allowed a separate court, little inferior to the emperor's; and when they come to age all of them, except the heir to the crown, who stays with his father, are sent to distant governments.

The young sultaneßes are educated with all the tenderness and indulgence imaginable; they are not under the same restraint as other women, and there are instances of the Mogul's indulging them in their gallantries, which is the more reasonable, as being of the royal blood, they must never marry, and be under the controul of a subject. Their jewels and precious stones are extremely valuable, and their cloaths are as thin and light as possible, on account of the heat of the climate.

The governesses of the young princesses, and those who are spies upon the conduct of the king's women, form a considerable body in the seraglio, and are said to have a great share in the government of the empire. If the Mogul can properly be said to have any council, it is composed of those ladies; for the governments and great offices of state are disposed of by their influence, and each of them has a title answerable to some great office. One is styled prime minister, another secretary, and another viceroy of a province, and each lady keeps up a correspondence with the minister, whose title she bears, and there are eunuchs continually employed in carrying letters backwards and forwards between them. By their interposition all business of consequence is conducted, for they have better opportunities of representing things to the emperor than his ministers can have.

The

The emperor in his retirement is served intirely by women, and is also said to have a guard of Tartar women, armed with bows and fabres, who have the care of his person. The gates and all the avenues to the palace are guarded by a multitude of eunuchs, who are said to have a very difficult province; for if they are too rigid, they procure the hatred of the queens and princesses, who sometimes have great power; and if the Mogul thinks them too complaisant, they run the hazard of their lives. Neither the emperor nor any other great men lie with their women after they have passed a certain age, which some say is twenty-five, and others thirty; yet, notwithstanding this, they continue guarded as strict as ever.

An English divine who was at the Mogul's court, mentions one of these women being put to a cruel death, for being surprized by the Mogul while kissing an eunuch: for this supposed crime the emperor had the barbarity to cause her to be set up to the neck in the ground, and the earth to be rammed close about her. Thus she stood two days in the scorching-sun, and then expired, crying out as long as she could speak, "Oh my head, my head!" To add to her misery, the offending eunuch was brought before her, and her humanity shocked by seeing him torn in pieces by an elephant.

As the Mogul considers most of the other princes greatly inferior to him, he, like the other Asiatics, is above sending ambassadors to them, nor are ambassadors treated as the representatives of their sovereign, but only as common messengers. The Mogul's letters are received with as much reverence as if he himself was present; for the governor to whom they are dispatched, on receiving intelligence that they are upon the road, rides out with all his officers to meet the messenger who brings them, and no sooner sees the packet than he alights from his horse and falls prostrate on the earth; then takes them from the messenger, and placing them on his head, binds them fast, and returns back to the court where he usually dispatches business, and having read them, instantly returns an answer.

The governors have also another method of shewing their respect, for though they shave every day when at court, yet on their being sent to a government, they neither shave nor cut their hair till their return.

The Mogul, as hath been observed, administers justice himself in capital cases, wherever he resides, as his viceroys do in their respective provinces; but an officer, named the catoual, causes offenders to be apprehended, and inflicts punishments for small crimes. The cadi is judge in civil cases between man and man, and of marriages and divorces.

Though there are no written laws in the empire, certain punishments are usually inflicted for certain crimes. Thus murder and robbery are punished with death, but the manner of execution is entirely in the breast of the Mogul or viceroy, who never suffers malefactors to be above a night in prison, and very frequently he is not conveyed to any place of confinement; for if the offender be apprehended in the day time, he is immediately brought before the governor, and either acquitted or condemned; and from judgment he is hurried to his execution, which is generally performed in the market-place.

Some malefactors are hanged; others beheaded; some impaled on sharp stakes; some torn in pieces by wild beasts, or killed by elephants. If an elephant be ordered to dispatch a criminal instantly, he stamps upon the wretch, who lies trembling before him, with his broad round foot, and in a moment crushes him to death: if he is to die in torture, the elephant breaks first the bones of his legs, then those of his thighs and arms, and leaves him to die by the wounds he has given him. Sir Thomas Roe observes, that when he was at the Mogul's court, one hundred robbers were brought chained before that prince, with their accusation; and the Mogul having passed sentence of death, gave orders that the chief of them should be torn in pieces by dogs, and the rest put to death in the ordinary way. The prisoners were accordingly divided into several quarters of the town; their chief was torn in pieces by twelve dogs before the ambassador's house, and at the same place

thirteen of the robbers had their heads tied down to their feet, and their necks chopped half off with a sabre, after which they were left naked and bleeding in the streets, where they became a great annoyance to the neighbourhood.

SECT. XVII.

Of the Camps and Forces of the Mogul; the Method of procuring Subsistence, and the Cause of the ill Success of the Indian Troops against the Europeans.

THE camp is constantly pitched in one form, and is nearly round. A detachment always marches before the army and clears the ground, that the streets may lie in the usual regular order; and if it be removed ever so often, it preserves the same appearance. The whole circumference seldom takes up less than twenty miles, for the military men alone generally amount to about one hundred thousand.

The tents are commonly white, like the cloathing of the people; but that of the Mogul is red, and pitched in the center. It is erected much higher than the rest, and from it he has a complete view of the whole. As the queens and the whole seraglio take the field, the emperor's quarter is as large as a considerable town. It is surrounded with an inclosure about ten feet high, guarded by the troops of the household, and other great bodies of horse and foot and no body is suffered to approach it within the distance of a musquet shot. The tents of the omrahs stand at a distance round the emperor's, those of the first quality nearest, and the inferior people are placed in the remotest parts of the camp. The streets, formed by the tents, are wide and straight, and the principal of them extend in a direct line from the space of the royal quarter. In these are shops, and all manner of trades are carried on as in a city; and in every quarter is a market-place, where provisions are frequently sold almost as cheap as in garrison: the camp of the Mogul was formerly said to be the greatest market for diamonds in the world.

The camp seldom moves ten miles at a time, and is generally fixed at a place where there is plenty of water. The Indian armies have frequently a number of barges, placed on carriages which follow the camp, and these are used by the Mogul when he takes his pleasure upon the lakes and rivers, as well as in passing over his army; he has also with him hawks, dogs, and leopards bred for the game. Thus while he ranges from one part of his dominions to another, he divides his time between his recreations and his enquiries into the conduct of his viceroys and governors.

In these marches some of the Mogul's women are carried in little towers upon the backs of elephants; others in coaches; others in palanquins: and some of the meanest are said to have no better carriage than a kind of cradles hanging on the sides of camels; but all of them are close covered, and attended by eunuchs: besides, they have an advanced guard before them to clear the way; for though it is impossible to see them, it would be thought a crime even to look at the vehicles in which they ride, and the men are frequently ordered to quit the villages through which the road lies, till the ladies have passed by.

The Mogul's forces are principally composed of the troops furnished by the rajahs or pagan princes; he has also Moorish foot, but he principally depends on his horse. He has also several regiments, named the body-guards or household troops: the principal of these is a regiment of four thousand men, called the emperor's slaves. This is the most honourable body among the Mogul's troops: their captain is called the daroga, and is an officer of great authority, who has sometimes the command of the whole army. Every soldier admitted into this regiment is marked on the forehead, and from these troops the subaltern officers are taken, who are by degrees preferred to the dignity of omrahs or general officers.

There are also the guards of the golden mace, of the silver mace, and the iron mace, who carry a mace or

club on their shoulders with a large ball at the end. The foldiers of these bodies are differently marked in the foreheads, and their pay proportioned to the metal of the mace. These are all picked men, who have recommended themselves by their courage. The arms of the horsemen are a sabre, a dagger, a bow and quiver of arrows, a lance, and sometimes a short piece like a carbine, and to these are added a great shield, so that they are incumbered with arms. A foot foldier also carries a sword and dagger, a bow and arrows, a shield, and sometimes a match-lock musket. Others of them have pikes instead of muskets; they have also heavy artillery; but have generally European gunners to manage them. Some short pieces have been already mentioned that carry a bullet about the size of a tennis-ball, and are fired from the back of an elephant; there are also about three-score small field-pieces, which attend the grand army.

Mr. Cambridge observes, that it is equally difficult to conceive by what means a handful of Europeans have rendered themselves so respectable in the field when opposed to a multitude of Asiatics, and the possibility of subsisting such vast numbers as the Asiatic armies frequently consist of, especially with a very large proportion of horse: but our astonishment must be increased, if we add to the account, that every horseman has two servants, one to take care of his horse, and the other to procure him forage; and that all those, as hath been already mentioned, are accompanied by their wives and children, and that there always follows the camp a moveable town of shops, where every thing is to be sold, as in their cities, some hundreds of elephants merely for state, and a train of women with a numerous retinue belonging to the prince and the great officers. Wherever the sovereign moves, he is more taken up with a vain ostentation of pomp and magnificence, than with the object of the war; and it is his pleasure that his subjects should abandon the capital, in order to augment his numbers.

To provide for all these the whole country is put into motion, and strict orders are dispatched for provisions to be brought into the camp; by which means all the cities far and near are exhausted, while the camp is in general plentifully supplied. The person allowed every horseman to procure forage, is constantly employed in cutting turf and washing the roots, and this affords a more hearty food for a horse than grass. A shower of rain may in a few days produce another crop; and if the weather continues dry they move their camp.

However, these numerous armies seldom keep the field any time without great loss by famine; for a very considerable diminution is scarcely felt amongst such multitudes, and are very little regarded from any sentiments of humanity; a famine is therefore neither considered as any thing extraordinary, nor will the memory of it ever prevent the assembly of another multitude, that must also be liable to the same chances of subsisting or starving. Allowances must also be made for the great loss they sustain in men, beasts, and all the implements of war, as often as they move in difficult roads, and particularly in their manner of passing over great rivers: for their rivers, in the rainy season, become so rapid, that the landing place is frequently a mile below the place of embarkation. In crossing them they use large boats of a kind of basket-work, which they cover with skins. As there are always great plenty of hides in so numerous an army, they are easily made; and, tho' they are light and manageable, are capable of carrying a considerable number of horse, and of transporting the heaviest artillery.

The true cause of the ill success of the Indian armies in an engagement, proceeds from their being unacquainted with the advantages of discipline, and their keeping their infantry upon too low a footing. Their cavalry, though not backward to engage with sabres, are extremely unwilling to bring their horses within the reach of our guns; for they are less afraid of their lives than of their fortunes, which are all laid out on the horse upon which they ride.

Nothing is more prejudicial to them than the false notion they generally entertain in relation to artillery. They are terrified with that of an enemy, and weakly

put a confidence in their own, placing their chief dependence on the largest pieces, which they neither know how to manage nor to move. Some of these carry a ball of seventy pounds. When the Europeans march round them with their light field-pieces, and make it necessary to move those enormous weights, if a shot comes among their bullocks they become quite ungovernable, and are so ill harnessed, that it causes no small delay to free the rest from any one that happens to be unruly or slain.

We have a much greater advantage in their being tenacious of their ancient manners, than in their want of bravery; not only the prince, but every rajah, who has the command of all the forces he can bring into the field, always appears among them mounted on an elephant, and is at once the general and ensign of his men, who constantly keep their eyes on him; and if they lose sight of him for a moment, conclude that all is lost, and instantly disperse. This affords our engineers a fair opportunity of deciding the fate of a whole detachment by one well directed discharge of a six-pounder; and those enormous beasts now seem brought into the field only to be a mark for our artillery. Those rajahs, sensible of being thus exposed, sometimes avail themselves of the only expedient that can afford them any security; for it has been observed, that several elephants, with the same caparisons, and with riders in the same rich and splendid habits, have appeared in different parts of the field on the same day.

Though they have severely suffered by being surprized in the night by the Europeans, they can never be brought to establish in their camp either order or vigilance; for at the close of the evening every man eats a great quantity of rice, and many take after it soporific drugs, so that about midnight the whole army is in a dead sleep; the consequence of which is obvious: and yet, says the above author, an eastern monarch would think it very strange, should any body endeavour to persuade him, that the security of his throne depended upon the regulation of the meals of a common soldier; much less would he be prevailed on to restrain him in the use of that opium which is to warm his blood for action, and animate his soul with heroism. The mind of an European soldier must be equally filled with compassion and contempt at seeing a heap of these unhappy creatures, animated by a momentary intoxication, crowded into a breach, and both in their garb and impotent fury resembling a mob of frantic women. In short, the very eastern dress has an appearance of effeminacy, and the Europeans are not inclined to be struck with much apprehension at seeing a body of horse in silk or cotton robes.

SECT. XVIII.

Of the Revenues of the Mogul, the Coins, Weights, and Measures of Indostan; and of its Trade and naval Vessels.

THE revenues of the Mogul arise from the produce of the ground, the customs of the sea-ports, the estates of the great men at their death, which devolve to the crown, the presents from his subjects, who never approach their prince or governor empty-handed, and the treasures produced by the diamond mines. The viceroy, or governor, of every province, who owns his subjection to him, is obliged to supply the crown with a certain sum, which he raises out of the manufactures and produce of the soil. This, added to the other revenues, is said to amount annually to between forty and fifty millions sterling; an immense sum, which must be greatly lessened since Nadir Sha ravaged the empire, took away its treasures, and, by weakening the power of the prince, enabled many of the Nabobs to throw off their subjection to him.

The coins of this country are the pice, or cash, which are of copper, and about the value of a half-penny: the fanam, a silver coin, worth three-pence; the rupee, a silver coin, worth two shillings and three-pence; the gold moer, or rupee, worth about fourteen silver rupees; and the pagoda, so called from its having the figure of a pagoda stamped upon it. The last, which are worth

nine shillings, are flat on one side and convex on the other, and are chiefly coined by the rajahs or petty princes.

Gold and silver coins are finer here than in any other country. Foreigners have their mints, and coin both gold and silver, particularly the English at Fort St. George. Foreign coins are also current, but for trifling matters they sometimes use bitter almonds, or sea-shells called couries, or blackmoor's-teeth, sixty of which are valued at about a half-penny. Whatever foreign coin falls into the hands of the Mogul's governors is melted down into rupees, with the characters of the reigning emperor; and after his death they lose the value of a half-penny, or penny, on account of wear; and none but the new coin is current at the full value.

Large sums are reckoned by lecks, carons, and arabs. A leck is one hundred thousand rupees; a caron, or carol, is one hundred lecks; and an arab is ten carons.

Their weights differ almost in every port, and frequently in the same port, and therefore they cannot be exactly specified. The common weight at Surat is the seer, which is about thirteen ounces one-third; and forty seers generally make a maund. The seer at Agra is said to be equal to two at Surat. The candy varies from five hundred weight to five hundred and seventy; but it is generally said that twenty maunds go to a candy. Salt-petre, turmeric, assafoetida, pepper, dry ginger, benjamin, and tyncal, have, according to Mr. Lockyer, forty-two seers of Surat to the maund. Copperas, aloes, brimstone, long-pepper, dammer, stick-lack, and wormseed, have forty-four seers to the maund; and, for the most part, such goods as have no waste, as quicksilver, copper, ivory, vermilion, Lahor indigo, tutanag, &c. are sold at forty seers to the maund, or three maunds to one hundred weight.

At Surat, corn, rice, and other commodities, sold with us by measure, are there sold by weight; but silks and calicoes are sold by the pieces, and by the cobit, which contains twenty-seven inches.

The coss, by which the roads are measured, is, near the coasts, about an English mile and a half; but farther up the country, and particularly near Brampour, it is almost two English miles.

In liquid and dry measures, one measure is one pint and a half: eight measures are one mercall; and four hundred mercalls are one garse.

The principal manufactures of Indostan are silks, calicoes, and muslins: we also import from thence diamonds and other precious stones, great quantities of pepper, the growth of the Malabar coast, indigo, salt-petre, cardamums, opium, assafoetida, and a great variety of physical drugs. The goods exported thither from Europe are English broad-cloth, lead, looking-glasses, sword-blades, knives, haberdashery-wares, gold and silver lace, tin-ware, brandy, beer, and some other provisions chiefly taken in by our own factories. The ships also frequently take in flints with their ballast, for there is not a flint to be found in India, at least in the parts visited by the Europeans; so that in the inland country, where the people have not an opportunity of being supplied by our shipping, a bag of flints is almost as valuable as a bag of money.

It must however be confessed, that all the goods we carry to India are a trifle, compared with the bullion and foreign coin exported thither. Our ships, when they go out, are in a manner empty of merchandize, though few of them carry less than three or four score thousand pounds in specie. This has raised a question, whether the India trade be of any advantage to this nation; but, in return, the company answer, that the Indian merchandize they re-export and sell in several parts of Europe bring in more treasure than they carry out; and were it otherwise, we should have other nations monopolize the trade, and supply us with the same commodities, and consequently more treasure would be paid to them than is now carried to India.

But to return, there are no greater merchants in the world than the Mogul subjects, though their ships never pass the Cape of Good Hope; for they carry on a prodigious trade to Persia and the Red Sea, and supply both Turkey and Persia with all the rich merchandize of India; in return for which they bring back carpets,

pearls, and other Persian commodities, but chiefly treasure, which they frequently load on board English or Dutch ships, and the freight is said to be one great branch of the company's profit; for they seldom dispatch a ship from Persia to Surat but she is as deep laden as she can swim, full of passengers, with vast quantities of pearls and treasures on board, sometimes to the amount of two or three hundred thousand pounds.

The Indians make use of European ships to import their treasure chiefly for security; for they consider them as being in much less danger from pirates than their own shipping. They have ships indeed of four or five hundred tons burthen built in India after the English model; but their laskars, or Indian sailors, would make but a poor defence should they be attacked, and they have but little skill in navigation.

We have already given an account of the Indian ships and their manner of construction, and shall here only add, that their boats used on the coast, called mussoulas, are flat-bottomed vessels, the sides of which are five or six feet high; the planks are very thin, and sewed together with cocoa-nut cordage, so that they will yield like pasteboard, and are in no danger of splitting when they strike, as they must frequently do on many parts of that coast before they can get to shore, and on this account they are generally used by the English in landing their goods: they are rowed by six or eight hands; but as they are very deep, and will carry great quantities, it is not very expensive to employ them in landing or embarking goods. They have another kind of vessel, if it may be called by that name, which is termed a catamaran, and is only formed of three or four rough pieces of timber tied together, and are chiefly used by the fishermen on account of their not being fit to carry such goods as may be damaged by the wet, a very little sea beating over them. For the same reason passengers seldom make use of them, though they are really safer on that coast than any other vessels, and some people have sailed along the shore upon one of them for a hundred miles together; and upon these kind of floats the Indians carry the heaviest weights; as great guns, anchors, &c.

Having now taken a view of the country people of India in general, we shall present before the reader a view of the two capitals of that empire, and of the remarkable revolutions that have lately happened at Delli, the present capital.

S E C T. XIX.

Of Agra, one of the capital Cities of the Empire; with a Description of the Palace.

AGRA, the capital of the province of the same name, and the ancient metropolis of the whole empire, is situated in twenty-six degrees twenty minutes north latitude, and in seventy-nine degrees east longitude from London. It is about seven hundred miles north-east of Surat, and is situated upon the river Jemma, in the midst of a sandy plain, which greatly adds to the heat of the climate. The city is seven or eight miles in length, but not near so much in breadth, and no part of it is fortified except the palace; but there is generally a great army in the place, especially if the Mogul be there.

The palaces of the omrahs and other great men are built with stone in a magnificent manner; they stand upon the banks of the river Jemma, and have large gardens adjoining to them; but the rest of the houses are mean buildings: however, the great number of mosques, earavanferas, large squares, baths, and reservoirs of water, intermixed with trees and gardens, added to the river Jemma running the whole length of the city, renders its prospect very agreeable; and the Mogul's palace is a noble building.

A large area extends between the town and the palace, where the rajahs draw up the raskoots when they mount the Mogul's guard, as they do every week in their turns with fifteen or twenty thousand men. The palace is situated by the side of the river in the form of a crescent, but from the town it appears to be round; it is three or four leagues in circumference, and fortified with a high

high stone wall mounted with artillery. As the stones with which this wall is built are red, and have a lustre like polished marble, the wall appears extremely noble when the sun shines upon it: it is surrounded with a deep broad moat, over which are draw-bridges, and the terraces of the gardens serve for a rampart.

On entering the first gate of the palace you find a handsome broad stone walk, with canals running along the sides; and beyond it a large square, where the Mahometan guards are drawn up, and here the omrahs pitch their tents; so that you pass through two armies, one on the out-side and the other within the palace, before you reach the royal apartments.

Beyond this square is another court, where the Mogul's music used to sound every morning, noon, and night, and whenever he went abroad. From this court you come to the Durbar, another large court, where all people resorted at the time of audience. It is divided by balustrades into three parts; at the outer balustrade stood the common people; without the next, which is raised on a platform something higher, were those of superior rank; and within the third, upon a platform still more elevated, stood the omrahs and great lords of the court. In this manner all waited the approach of the Mogul at the time of audience; who, upon the playing of the music, appeared in a kind of gallery above the place where the omrahs stood, and seated himself upon a throne covered with jewels of inestimable value. Here the emperor received petitions from his subjects, and spent several hours every day in hearing causes.

On leaving the Durbar the emperor retired to his baths, followed only by some of his prime ministers, with whom he advised on affairs of state. From another gallery in the palace the emperor reviewed his troops, his elephants, and horses; and saw the combats of wild beasts, or those of men and beasts, which some of the Moguls esteemed a favourite amusement. Here also malefactors were frequently executed before him, by being torn to pieces, or trampled to death by elephants; and sometimes beheaded, according to the emperor's pleasure; the execution immediately following the sentence.

The Haram, or womens apartment, where there were seldom less than a thousand, who had their eunuchs and slaves to attend them, takes up a considerable part of the inclosure; and, as it wants neither gardens, canals, parks, or any thing which can contribute to the beauty or pleasure of the place, the circumference must be very great. Besides, within the walls was a quarter where all manner of artificers, were daily employed in the emperor's service. These observed a profound silence and no other noise was heard but what was unavoidably occasioned by their business.

With respect to the city, the mosques and magnificent tombs which are seen there, shew that it has been one of the most flourishing places in the Indies. In the year 1638, it was computed that it had seventy great mosques, among which were six principal ones, at which the Mahometans offered up their devotions at their public festivals. In one of the last is the sepulchre of one of the saints, thirty feet in length, and sixteen in breadth. The people say he was a giant, and the greatest warrior their nation ever produced. To this tomb they make frequent pilgrimages, when their offerings amount to prodigious sums, which serve to feed every day a vast number of poor. These mosques and their courts afford an asylum for criminals, and for those who are threatened with a prison by their creditors. Even the Mogul himself dare not so much as attempt to take a criminal from thence, for fear of violating the respect which his religion makes him think due to those who are honoured with the title of saints. The wife of the emperor Sha Jehan thought to render her memory illustrious, and to merit the veneration of after ages, by the mausoleum which she caused to be erected near the walls of Agra. This work is said to be extremely magnificent, and was twenty-two years in building, though twenty thousand men were incessantly employed about it.

There are in Agra near eight hundred baths, from which the Mogul annually receives very considerable

sums; for those purifications being one of the principal points of the Mahometan religion, there does not pass a day in which those places are not frequented by an almost infinite number of people.

The inhabitants are chiefly Moors and Moguls, who have the government entirely in their hands; there are also a considerable number of Gentoos, Jews, Armenians, and Portuguese. But though Agra is extremely populous when the court is there, it is at other times a perfect desert; for not only those who have an immediate dependance on the court and army, but the merchants and tradesmen remove with their families to follow the camp.

S E C T. XX.

Of the City of Delli, the present metropolis; a Description of the Palace, and an Account of the Revolutions that have lately happened in that City.

DELLI, the capital of the province of the same name, and the present capital of the empire, is situated in seventy-nine degrees east longitude from London, and in twenty-eight degrees north latitude, and stands on the river Jemma, which divides it into two parts: that last built was erected by Sha Jehan, and from thence is called Jehanabad; but they are both together called by the Europeans by the name of Delli. In the part built by that emperor, all the houses enclose spacious courts, and in the inner part of these buildings the people lodge, to prevent any from approaching the places appointed for their women. Most of the great men have houses without the city, on account of the convenience of the waters.

The entrance into the city is by a long street, on each side of which are regular arches, under which the merchants have their shops. This street leads to the palace, which is above a mile and a half round. The wall is built of hewn stone, with battlements, and at every tenth battlement is a tower. The ditches which surround the wall, are full of water, and also faced with hewn stone. The grand portal has nothing extraordinary in its appearance, and as little has the first court into which the great lords are permitted to enter, seated on their elephants: this leads to a large and long passage adorned with fine porticos, under which are many small rooms, into which a part of the guards retire: on each side are the womens apartment, and the great halls where justice is administered; and in the middle of the passage is a canal filled with water, which at equal distances is formed into little basons. From thence a passage leads to a second court, where the omrahs mount guard in person. They have their quarters there, and their horses are tied before the gates.

On entering the third court, the divan, where the king gives audience, appears in front. It has a hall, to which is an ascent of seven or eight steps: this structure is open on three sides, and its roof, which consists of a number of arches, is supported by thirty-two marble columns. When the emperor Sha Jehan caused this hall to be erected, he gave orders that it should be all over enriched with the finest work formed of jewels inlaid: but when the men had made the trial on some columns to the height of two or three feet, they found it would be impossible to find a number of jewels sufficient to execute so grand a design, and that the expence would be immense; the Mogul was therefore obliged to abandon the project, and to be contented with painting it with different flowers.

In the midst of this hall, opposite to the wall which looks into the court, is a kind of alcove, and there the throne on which the king gives audience is erected: after the manner of the ancient orientals, it is in the form of a small bed with three feet; but its magnificence could not be believed, were it not attested by the most credible witnesses. This bed is adorned with four columns, a canopy, a head-board, a bolster, and a counterpane: one would imagine that Sha Jehan, who caused it to be made, was resolved to exhaust upon it all the riches of his kingdom. It shines with gold, silver, emeralds,

emeralds, diamonds, and rubies, which have been diffused over it with great profusion. The canopy is so covered with them, that the eyes of the beholders are dazzled; its fringe is composed of gold and pearls; the columns which support it are equally covered with them. The furniture of the bed with the counterpane which the prince has over him, are embroidered with gold and pearls; and the feet on which the bed stands, are no less adorned than the columns; to each of these last are fixed the Mogul's buckler, fabre, bow, quiver, arrows, and other arms.

At a small distance from the hall of the divan are the great stables, which are always full of the finest horses, in which the Mogul usually takes great delight; these are brought from Arabia, Persia, and Tartary at a great expence. Before every stable-door is hung a kind of mat made of reeds, and bound together with silk twisted in the form of flowers. These are intended to prevent the flies from entering: but they are not satisfied with this precaution; every horse has two grooms, who relieve one another, and fan them continually. All the day they have carpets over them, and at night they lie upon a litter made of their own dung dried in the sun, and well pounded.

The other public buildings in this city are a great mosque, which has several fine marble domes; and a noble caravanserai, built by a Mogul princess for the accommodation of strangers.

It is necessary to inform the reader, that the account we have here given of the splendor of the divan, was written before the city was plundered of its jewels and treasures by Nadir Sha, and before the late revolutions in that city, which have served to reduce that capital from its antient grandeur, and to weaken the strength of the Mogul.

The Pattans, a race of northern people who inhabit the mountains of Candahar, though Mahometans, are no less enemies to the Moorish government, than the Morattas, or other Indian Gentoos. They were always esteemed good soldiers, and are now considered as the very best infantry in the whole empire. This warlike nation rendered themselves formidable to Nadir Sha in their march; and after that conqueror had left the Mogul empire in the weak and indefensible state to which he had reduced it, they invaded that country, on a supposition that it was then in too low a condition to be able to resist the force which he then thought fit to bring against it.

The emperor being apprised of their march, assembled his council, and sitting on his throne surrounded by his generals and twenty-two principal omrahs, held in his hands a betel, which, according to the custom of the country, he offered to that chief who would immediately engage to take the command of the army, and repulse the enemies of his country. But so universal was the treachery or cowardice of his courtiers, that not one of them advanced to take the betel as a pledge of their fidelity; which the young prince, who was then about eighteen, observing with extreme concern, presented himself before his father, earnestly intreating that he might be permitted to receive it.

His father, refusing his request, told him, that it was not proper for the heir of the empire to expose himself in so dangerous an enterprize, while there were so many experienced generals more fit for that service. The omrahs, on the other hand, all maintained, that as his son had offered to take the betel, he alone should put himself at the head of the troops; and joining their solicitations with those of the prince, at length prevailed on the emperor, who immediately gave orders for raising three hundred thousand men.

The omrahs, exasperated at the prince's boldness, on their withdrawing from court, entered into a conspiracy, and gaining the chiefs of the several bodies of which this army, so hastily assembled, was composed, concerted with them the means of betraying the prince; but the young hero being informed of the plot laid against his life, had the address, a little before he engaged the Pattans, to secure the persons of those treacherous commanders; and then attacking the enemy, gained a complete victo-

ry, and obliged them to quit the country by a precipitate flight.

While the brave prince was thus gloriously delivering his country from the Pattans, the conspirators in the capital caused it to be reported, that he was fallen in battle; and entering the palace, seized on the emperor and strangled him, and then gave out that he had poisoned himself in a fit of despair, occasioned by his son's death, and the loss of the battle. The horrible assassination reached the ears of the prince, who was now returning in triumph to Delli; and being sensible of the danger that threatened his own life from so formidable a conspiracy, he adopted the stratagem which his grandfather Aurengzebe practised on another occasion. Pretending to believe that his father died a natural death, he appeared inconsolable for the loss of his father, and tearing off his garments, took the habit of a fakir, publicly declaring that he renounced the world, and would never more concern himself in the government. A court of justice for state criminals is a thing unheard of in these lawless governments, and the only way of punishing a traitor is by turning against him his own acts of treachery and deceit.

The prince acted his part so perfectly as to deceive the conspirators, who went out to meet him with assurances of their readiness to acknowledge him for their lord and king; and in return he declared his intentions to give up all thoughts of the crown, and even to retire from the world; and telling them, that as it was necessary so extensive an empire should not be destitute of a head, he entreated their assistance to direct him in the choice of an emperor, desiring them to assemble that evening in his palace to deliberate on this important affair. The omrahs retired, flattering themselves that they had now obtained an opportunity of setting up a creature of their own; while Amet Sha, for that was the young emperor's name, entered the royal palace, and placed a number of trusty persons on each side of the doors of the several avenues which lead to the inner court.

The entrance to the apartments of the princes of the East is disposed with a view to prevent the irruption of assassins, there being no approaching the presence-chamber but through long oblique passages, in which, at proper intervals, are recesses for the posting of guards; a contrivance that at once secures the monarch from the attempts of the most determined villains, and at the same time affords him an opportunity of executing his purposes on those who have incurred his displeasure.

Every thing being thus disposed for the reception of the omrahs, each as they arrived were introduced to these fatal avenues; and as they stooped to pass the curtains, which are generally kept lowered, were seized by the guards, and immediately received the just reward of their crimes. Thus the Mogul Amet Sha established himself in the quiet possession of the throne, by triumphing at once over his foreign and domestic enemies. But it was not long before the peace of Delli was more fatally disturbed; for the Pattan chief soon after assembled a much more formidable army, and entering Delli, gave up that city to be plundered three days by his soldiers. In the mean time he seized upon the royal treasury, and obliged the collectors of the public revenues to account to him for all they had received. He then marched home, being supposed to have taken away more riches, except jewels, than Nadir Sha carried out of the country. He however, then made no revolution, nor any alteration in the government of Indostan; but when he returned to Lahor, he drew a line from north to south, claiming a vast extent of country to the west of that line, which was at least nominally dependent on the empire of Indostan; and leaving his son Timur there as governor of his new dominions, gave at that time no farther disturbance to Indostan.

Since this time several revolutions have happened at Delli, and in 1757 this Timur was seated on the throne, and the empire of Mogul became subject to the Pattans.

We shall now take a view of the most considerable countries and cities of India, either distinguish-

ed by peculiar advantages, or by their containing European settlements, which shall be described, and some account be given of the military operations in each.

S E C T. XXI.

Of the Province of Bengal, and of the Factories of Fort William at Calcutta, and those of Chandenagore and Hugley or Ouglia, with a remarkable Instance of the Strength of the Opium on the Banks of the Ganges. Of the Towns of Saumelpour, Dacca, Chalgian, and Patna.

BENGAL is well known by giving its name to the greatest gulf in Asia, which separates the two peninsulas of the Indies. This kingdom, which is situated at the north-west extremity of the gulf, is near two hundred and fifty leagues from east to west, and is esteemed the most fertile country of the Indies in sugar, silk, fruits, pepper, opium, rice, salt-petre, gum-lack, and civet, with all which commodities it furnishes the most distant provinces. The country is intersected by numerous streams, which serve to water it, and to facilitate the transporting of mercantile goods. Their banks are covered with towns and villages extremely well peopled, and with great fields of rice, sugar, and wheat, much larger than that of Europe. It is usually compared to Egypt for its fertility, the river Ganges here dividing itself into several branches, and annually overflowing the country as the Nile does Egypt.

The finest canes brought to Europe come from this kingdom, and a small sort of canes grow here much more supple than others; these the inhabitants work into vessels in so close a manner, that having glazed them on the inside, they are able to contain all kind of liquors as securely as glass or silver. An herb is also gathered in this country, which sends up first a pretty high stem of the thickness of one's finger, afterwards leaves, and on the top of all a large bud like a tuft. The Indians spin it and make it into tapestry and very beautiful stuffs, upon which they represent all sorts of figures.

Fort William is a factory belonging to the English East India Company, seated up the river Hugley, the most westerly branch of the river Ganges, and received its name from king William III. who came to the throne just about the time when it was built. It was first erected in the form of an irregular tetragon of brick and mortar, and the town is built without the least order, because every one built a house where he liked best, and as most suited his own convenience. About fifty yards from the fort stands the church, which was erected by the contribution of the merchants who resided there, and of the sea-faring people who traded to that place. The governor's house is within the fort, and is as regular a piece of architecture as is to be seen of the kind in India. Here are also convenient lodgings both for the factors and writers, store-houses for the company's goods, magazines for ammunition, and an hospital. The company have a garden and fish-pond for the use of the governor's kitchen; and most of the inhabitants, that make any tolerable figure, have the same advantages. On the other side of the river are docks for repairing the ship's bottoms, and a garden belonging to the Armenians.

The garrison generally consists of two or three hundred soldiers, who are usually employed in conveying the company's fleet from Patna with their salt-petre, piece-goods, raw-silk, and opium.

All sorts of provisions are extremely cheap and very good, and cloathing may be purchased for a trifle. The town is named Calcutta, and is governed by a mayor and aldermen.

The place is esteemed very unhealthy on account of there being a salt-water lake three miles to the north-east, which overflowing in September and October vast numbers of fish are left dry, when the floods retire, and infect the air by their putrefaction. Another inconvenience is the houses fronting the afternoon's sun, which renders the streets, both above and below the fort, so hot as to be almost insupportable.

In the year 1757 the viceroy of Bengal, being irritated by some transactions of the company, levied a numerous

army and invested Calcutta, which was then in no posture of defence. The governor, intimidated by the number and power of the enemy, deserted the fort, and, with several of the principal persons in the settlement, went on board a ship in the river, taking with them their most valuable effects, and the company's books. Mr. Holwell, the second in command, defended the place; and, by the assistance of a few brave officers and a feeble garrison, repulsed several attacks of the enemy with great intrepidity; but was at length obliged to submit, after he had received the promise of the suba, or viceroy, that no injury should be done to any of the garrison. But, notwithstanding this promise, he no sooner entered the fort, than the garrison and inhabitants, consisting of one hundred and forty-six persons, were driven into a place about eighteen feet square, called The Black-hole prison: there they were cruelly confined during the whole night, and deprived of the fresh air in a very sultry climate; by which means only twenty-three survived; for all the rest perished in a most dreadful manner by a lingering suffocation, in which they experienced all the miseries of extreme heat and thirst.

However, on the thirty-first of January following admiral Watson and colonel Clive appeared with two ships before the town of Calcutta, to revenge the tragedy acted upon their countrymen, and were received by a brisk fire from the batteries: but they soon silenced the enemy's guns, and in less than two hours the place and fort were abandoned; for colonel Clive had, in the mean time, invested the town, and by the vigour of his attack greatly contributed to its sudden reduction. A few days after they reduced Hugley, and the Nabob's store-houses of salt, and vast quantities of provisions for the support of his army, were burnt.

The viceroy, now more than ever incensed against the English, resolved to take ample revenge for his late disgraces. He marched towards Calcutta, and encamped about a mile from the town; when colonel Clive applying to the admiral for a reinforcement, obtained six hundred men, and then drawing out his forces, advanced in three columns towards the enemy. He began the attack with such vigour, that the viceroy, after a feeble resistance retreated with the loss of a thousand men killed, wounded, and taken prisoners.

Chandenagore, a French settlement higher up the river than Calcutta, and the most considerable place possessed by that nation in the bay of Bengal, is strongly fortified and encompassed by a wall; but was besieged and taken by the admirals Watson and Pocock, who battered it with their ships, while colonel Clive made his approaches on the land-side; and taking possession of the place, they found that the garrison consisted of five hundred Europeans and twelve hundred Indians, and that the fortress was defended by one hundred and twenty-three pieces of cannon and three mortars.

Fifty miles to the north of Calcutta is Hugley, or Ouglia, where the English once had a factory, which they afterwards removed to Calcutta. This town is seated on the most westerly branch of the river Ganges, and is of considerable extent, it reaching above two miles along the sides of the river, and carries on a considerable trade in all the commodities of Bengal. It annually affords rich cargoes for fifty or sixty ships, besides what is carried in carriages to the neighbouring towns. Salt-petre is brought hither from Patna in vessels of about two hundred tons burthen.

The streets are wide but not paved. They are full of rich ware-houses and shops of all sorts of India goods, especially silks, fine cloth, and stuffs. The best opium in the world is said to come from this town, which, at least, carries on the greatest trade in this commodity, it being exported from thence all over India.

The soil of the Ganges is esteemed the most proper for producing the strongest sort of this drug; in proof of which Mr. Grose mentions a remarkable instance: a Nabob of those parts having invited an English factor to an entertainment, a young gentleman, a writer in the company's service, sauntering about the garden plucked a poppy, and sucked the head of it, probably apprehending no other danger from it than is to be found from these

those plants in England. But he soon fell into a profound sleep, of which the Nabob being informed, eagerly enquired, with much concern, of the particular bed out of which the poppy was gathered; and being told, he, with strong expressions of sorrow, apologized for his having supposed that the nature of poppies was too well known to require any warning, especially as the taste was far from being tempting; but that the sort which the English gentleman was so unfortunate to pitch upon admitted of no human remedy, and nothing could save him: this was really the case, for that sleep was his last.

There are abundance of Moorish merchants, who carry on a considerable trade here, and have five pagodas in the great market-place.

The Dutch have also a factory here built in an open place, about a musquet shot from the river. It resembles a castle, being encompassed with deep ditches full of water; and also defended by high stone walls and by bastions, being faced with stone, and mounted with cannon. Their great warehouses are also stone, and their apartments for the officers and merchants are spacious and convenient.

Saumelpour, situated in the same kingdom about thirty leagues to the north of Ouglia, is famous for the fine diamonds, which are not found, as in other places, in the bowels of the earth, but in the sands of the river Gauel. They begin their search at the town of Saumelpour, and carry it up to the mountains whence the Gauel has its source; a space of about fifty leagues. In this work eight or ten thousand persons are employed. From thence come those fine small diamonds called genuine sparks: but stones above a certain size are seldom found. This is said to be a large town; but the houses are chiefly built of earth, and covered with branches of cocoa-trees.

Daca, the largest city in Bengal, lies upon the same branch of the Ganges, in twenty-four degrees north latitude, and from thence come the best and finest Indian embroideries in gold, silver, or silk. Provisions of all sorts are very plentiful, and exceeding cheap.

Chaligan is situated in twenty-three degrees north latitude, near the mouth of the most easterly branch of the Ganges, in the kingdom of Bengal. Here the Portuguese formerly erected a kind of sovereignty, and associating with the pirates and banditti of all nations, owned no subjection either to their own prince or to the prince of the country, but committed daily robberies both by sea and land, and so interrupted all commerce, that one of the late Moguls found it necessary to send an army against them, and to extirpate that pest of society. The town is now a poor place, and has but few cotton manufactures; but it affords the best timber for building of any place about it. The inhabitants are said to be so afraid of each other as to go continually armed.

Patna, the capital of the territory of the same name, is situated in a pleasant and fruitful country, and is said to be six miles in length, and one of the largest cities in India. Mr. Hamilton says 'tis the seat of the viceroy of Bengal, who resides in the highest part of the town; and observes, that the place is the more extensive, as the houses, which are only of cane, are erected at some distance from each other. The English and Dutch have factories here for salt-petre and raw-silk.

S E C T. XXII.

Of Golconda, with an Account of the Diamond Mines of that Province, and of the Factories situated on its Coast, particularly Vizagapatam, Masulipatan, and other of less Note.

THE kingdom of Golconda extends two hundred and sixty miles along the bay of Bengal, and is about two hundred miles where broadest from east to west. The country has neither mines of gold, silver, or copper; it has, however, many of salt and fine iron; but is most remarkable on account of its diamond mines, which have rendered it very famous.

The diamond mines are generally adjacent to the rocky hills and mountains which run through the country, and it is supposed that they are to be found in all these mountains. In some of these mines the diamonds are found scattered in the earth within two or three fathoms of the surface, and in others they are found in a mineral in the body of the rocks forty or fifty fathoms deep. They here dig five or six feet into the rock, and then softening the stone by fire, proceed till they find the vein, which often runs two or three furlongs under the rock. All the earth is brought out, and being carefully searched, affords stones of various shapes and of a good water. The earth in which they are found is of a yellowish and sometimes of a reddish colour, which frequently adheres to the diamond with so strong a crust, that it is difficult to get it off.

In order to find the diamonds the workmen form a cistern, made of a kind of clay, with a small vent on one side a little above the bottom; into this they put a plug, then throwing into the cistern the earth they have dug, pour in water to dissolve it. They then break the clods, and stir the wet earth in the cistern, the lighter part of which is carried off in mud when the vent-hole is opened to let out the water. Thus they continue washing till what is in the cistern is pretty clean; and then in the middle of the day, when the sun shines bright, carefully look over all the sand, at which they are so expert, that the smallest stone cannot escape them; for the brightness of the sun being reflected by the diamonds assists them in the search; and if a cloud was to intervene, they would be apt to overlook them.

The undertakers watch the labourers very narrowly, lest they should conceal what they find; and take great care that the labourers expose to view no stone of a larger size than common, which if the governor should hear of he would cause it to be seized; for the governors of the mines enter into an agreement with the adventurers, that all the stones they find under a pagoda weight are to be their own; but the large ones above that weight belong to the king. A pagoda is nine mungelleens, and the mungelleen is five grains three-fifths.

These governors generally use the adventurers and miners very tyrannically; and by their extortions, and the taxes they oblige them to pay, keep them poor; at least they are obliged to appear so, to avoid their impositions; and therefore both the merchant and the miner generally go naked, with only a cloth about their waist, and a turban on their heads. This only relates to Golconda; for in Vissapour they are said to be kindly treated and permitted to enjoy their own; so that when they find in the mines of Golconda a larger stone than ordinary, they run away with it, and remove with their families to Vissapour.

This trade is almost entirely engrossed by the Banyans of Guzerat; and the workmen in mines, as well as their employers, are for the most part Gentoos.

The kingdom of Golconda, whose principal harbour is Masulipatan, extends from the gulph of Bengal to the kingdom of Vissapour, and from north to south is contained between those of Berar and Carnate. It was antiently part of a vast empire, the sovereign of which was called the emperor of Bissnagar, and contained almost all the peninsula from the northern extremity of Orixia to Cape Comorin. The Pattans, a nation of northern Tartars, deprived him of part of his dominions; another part was taken from him by the Mogul princes, who had advanced farther and farther towards the south; and the generals of this unfortunate prince, after betraying him, divided the rest of his dominions among themselves. From them the kingdoms of Decan, Vissapour, and Carnate, had their beginning, about two centuries ago. The present Nabob, or prince, is of the Mahometan religion, as are a great part of his subjects, and is tributary to the Great Mogul.

The city of Golconda, which gives name to the kingdom, is now two leagues in circuit. Its walls are built of hewn-stone three feet square, and surrounded with deep ditches. It has several superb mosques, in which are the tombs of the kings of Golconda.

On

On this coast stands Vizagapatam, an English factory, with eighteen carriage guns mounted on its ramparts. The country round it affords fine and ordinary cotton cloths, and the best dures or muslins of all India. But in the year 1709 the Nabob of Chikacul levied war upon this factory, because their former chief had borrowed money of him on the company's seal; and afterwards dying, his successor refused to pay it. The Nabob applied to the governor of Fort St. George, but with no better success. He therefore marched against Vizagapatam; but the war being drawn to a considerable length, grew burthensome to the company, and they at last compromised the affair, and paid the Nabob a sum almost equal to what he demanded.

Masulipatan stands on the north side of the river Nagundi, which parts the provinces of Golconda and Bishnagar in eighty-one degrees forty minutes east longitude from London, and in sixteen degrees thirty minutes north latitude. In the latter part of the last century this was esteemed one of the most flourishing towns in India, and one of the most profitable factories belonging to the English; though not only they, but the Dutch, Danes, and Portuguese, had factories here, it being at that time the greatest place of trade for calicoes, indigo, diamonds, and other precious stones. But notwithstanding its great trade the city is ill built, though very populous.

What is related of the heats felt in this city, appears almost incredible. It is said annually in the month of May the west wind blows during seven or eight hours in a day, the heat of which exceeds that of the scorching rays of the sun, and resembles that felt on approaching a house in flames. Though their chambers are closely shut up, the wood of the chairs, tables, and wainscot is so heated, that people are obliged continually to throw water upon them; but the rains which soon after fall plentifully, refresh the air, and lay the whole country under water; and the inhabitants receive the same benefit from it, that the Egyptians do from the inundations of the Nile, for they sow their land thus prepared with rice and other grain, without expecting any more rain for eight months, in all which time the trees are green, and alternately loaded with ripe fruits.

The city is encompassed by a wall and ditch, and towards the land-side is a deep morass, sometimes overflowed by the sea; and over it is a wooden bridge half a league in length, on breaking of which the town was supposed to be secure from invaders; but in the year 1759, when it was in the possession of the French, it was besieged by the English, commanded by colonel Forde. Our troops were employed in making the necessary approaches from the seventh of March to the seventh of April, when finding their ammunition almost spent, and several breaches made in the wall, a party of the troops crossed the morass, and took the town by storm, when the marquis de Conflans asking quarter for the garrison, it was granted: the English found in the place one hundred and fifty pieces of cannon, and a great quantity of ammunition.

About thirty miles to the south-west of Masulipatan, stands the town of Pettipoly, where the English have a small factory. About a hundred miles farther south is Coletore, where the English have another small factory; and about a day's sail farther to the south is Palicate, or Pullicar, which is situated at the mouth of a river of the same name, about twenty-three miles from Madras. This place has been in the possession of the Dutch upwards of an hundred years, and was one of their first settlements on the continent of India.

S E C T. XXIII.

Of Madras, or Fort St. George, the Capital of the English Company's Settlements in the East-Indies.

MADRASS, or Fort St. George, the capital of the English company's dominions in the East-Indies, has its last mentioned name from the fort in that City, and is situated in thirteen degrees north latitude, and in

eighty degrees east longitude. Thus it is near four thousand eight hundred miles to the eastward of London, so that the sun visits them about six hours before he rises in England, and sets before we sit down to dinner; and there is so little difference in the length of the days, that the English always reckon it to be six o'clock at sun-rising and at sun-set.

This place is situated on one of the most incommodious spots imaginable; for the sea beats perpetually with prodigious violence on the land on which it stands; there is no fresh water within a mile of it: in the rainy season it is subject to inundations, from a river of salt-water that runs behind it; and the sun from April to September is exceeding hot, the sea-breezes alone rendering it habitable. Various reasons are given for this injudicious choice of a settlement; according to some accounts, the person entrusted by the company about the beginning of the reign of king Charles II. to erect a fortress on that coast, made choice of this place as the most proper to ruin the trade of the Portuguese settlement at St. Thomas; while others assert, that his only motive was to be near a mistress he had at the Portuguese colony. It is, however, certain, that there were several places in its neighbourhood free from most or all these inconveniences.

However, the war carried on by the company at Bombay and Bengal from the year 1685 to 1689, against the subjects of the Mogul, was a considerable advantage to Madras: for the tranquility that reigned there, and its vicinity to the diamond mines of Golconda, where good purchases are frequently to be made, caused a prodigious resort of Indian merchants to this place, and contributed to render it populous and flourishing.

The fort is a regular square extending about one hundred yards on each side, and has four bastions built with what is there called iron stone, from its being of the colour of unwrought iron, and very tough. The fort is defended by no ditch, and the walls are arched and hollowed within. It has two gates, one of which opens to the east, and the other to the west. The former, which is towards the sea, is but small, and is only guarded by a file of musketeers; but the western gate, which opens towards the land, is pretty large, and defended by the main guard, the soldiers belonging to it lying on the right and left under the wall, which, being hollow, answers the purpose of a guard-house. In the middle of the fort is the governor's house, in which are apartments for the company's servants: it is a very handsome lofty building of square stone, to which there is an ascent to the first rooms by ten or twelve steps, and from thence a pair of stairs leads to the council-chamber and the lodgings of the governor.

To the northward of the fort are three straight handsome streets, and there are the same number to the south. The buildings are of brick, and the houses of one story above the ground-floor; they have flat roofs, covered with a plaster made of sea-shells, which no rain can penetrate; and being secured with battlements, the English take the fresh air upon them morning and evening. The walls of these houses are very thick, and the rooms lofty; but the upper floors are laid with bricks instead of boards. These are all situated in the White Town, which is inhabited by Europeans, and forms an oblong square of a mile in length, but not half so much in breadth, and are encompassed by walls. The fort stands in the center of these buildings, and faces the sea on one side, and a river on the other.

Opposite to the west gate of the fort is a barrack, or rather a long room, in which all the company's soldiers are obliged to lodge when off the guard; and adjoining to it, on the north, is a commodious hospital, where care is taken of them when they are sick. At the other end of the barrack is the mint, where the company coin bullion brought from Europe, and elsewhere, into rupees; and this brings them a considerable revenue. They also coin gold into pagodas of different denominations and value.

On the south side of the fort is the English church, which is a pretty elegant building of a moderate size, and has a handsome altar-piece, a gallery of fine carved wood resembling cedar, and an organ, with which they salute

salute God and the governor; for he no sooner enters the church than the organ strikes up. The floor is of black and white marble, the seats regular and convenient, and the windows large and unglazed, to admit the cooling breezes, for otherwise the heat would be insupportable, as the people, who are as thinly clothed when at home as possible, always come to church in the European dress.

The church has usually a stock of three or four thousand pounds, which is put out to interest, and that applied to the repairs of the church and the relief of the poor; but these are generally so few, that the greatest part of the interest goes to increase the principal; and as there is also an addition of a hundred pounds and upwards annually collected, the buildings belonging to the church are always kept in good repair and properly beautified.

The orphan children of the wealthy inhabitants are frequently committed to the care of the trustees for the church, who put out their fortunes to interest at seven per cent. out of which they maintain and educate them, and restore the principal with the surplus when they come of age. Where there is no will made, the government takes care of the effects of the intestate and restores them to the relations of the deceased who are intitled to them, whether they reside there or in England.

There is a free-school, where children are taught to read and write; and a public library, which chiefly consists of books of divinity.

On the north side of the fort stands the Portuguese church, in which they are indulged the free exercise of the Romish religion. These are the only public buildings in the White Town, except the Town-house, where the mayor and his brethren, chosen by the free citizens, assemble, and a court of justice is held for civil causes.

A river runs close to the buildings on the west part of the town; but on that side there is no wall, and only a large battery which commands the plain beyond the river. On the east is a slight stone wall pretty high, which to the shipping in the road has a grand appearance; but on that side there is little occasion for any fortification, the sea coming up close to the town, and being so very shallow that no large vessels can ride within two miles of it; and yet the surf runs so high that there is no landing but in the country flat-bottomed boats. Both the north and south ends of the towns are defended by a stone wall of a moderate thickness; but, like those of the fort, each of these is hollow within, and would scarcely hold out one days battery. To the southward of the White Town is a small suburb, inhabited only by the black watermen and fishermen, consisting of little low thatched cottages; and beyond it is an out guard of blacks, who serve to give intelligence to the fort.

Adjoining to the White Town northward is the Black Town, inhabited by Portuguese, Armenians, Indians, and a great variety of other people. It is built in the form of a square, and is above a mile and a half in circumference, surrounded with a brick wall seventeen feet thick, with bastions at proper distances, after the modern way of fortification: it is also washed on the west by a river, and by the sea on the east; and to the northward a canal is cut from the river to the sea, and serves on that side for a moat: so that Madras, considering its situation, may be reckoned a town of strength when properly garrisoned.

The streets of the Black Town are wide, and some of them planted with trees; and having the sea on one side, and a river on the other, few towns are more pleasantly situated, or better supplied; but, except a few brick houses, the rest are poor cottages, built with clay and thatched, without so much as a window on the outside, or any furniture within, except the mats and carpets on which the people lie. The houses of the more wealthy Indians are usually in the same form, and have a little square in the middle, from whence they receive all their light. The great streets and the market-place are thronged with people; for though the houses are low and small, the place is extremely populous, six or seven people sleeping in one little room, with no other bed than a mat or cloth spread under them;

but, notwithstanding this appearance of poverty, there is no place where wealth abounds more, or where ready money is more plentiful, and the people from the highest to the lowest are extremely neat.

In the Black Town is an Armenian church, and several small pagodas, to which belong a considerable number of female choristers, as well as priests. These girls are early devoted to the service of the temple, and spend part of their time in singing anthems to their idols; and the rest with their gallants of any nation or religion: they also make a part of the retinue of great men when they go abroad; for every man of figure in the country has a number of these singing women to run before them.

Beyond the Black Town is the company's garden, which is half a mile in length, and is planted with orange trees, guavas, cocoas, mangoes, and a great variety of other fruit. There every body has the liberty of walking as often as they please. The East India company has several of the neighbouring villages under their government, which yield a considerable annual revenue; and have also a house and garden at St. Thomas's Mount, a hill seven or eight miles to the westward of Fort St. George.

The company's affairs are under the direction of the governor and his council, who inflict any corporal punishments, short of life and member, on the Europeans in their service, and dispose of all places of trust and profit.

There is also a court held by the mayor and aldermen twice a week at the Town hall, where the Asiatic inhabitants sue for their debts and implead each other. These magistrates appear in their gowns, and have a mace carried before them; but civil causes among the Europeans are usually decided by a jury in the court of the judge-advocate, to which belong two or three attorneys, and as many bailiffs, who arrest for debt, &c. There are also justices of peace, who hold their sessions in the Black Town on criminal affairs among the inhabitants. A court of admiralty is also held for maritime affairs, and the governor sometimes permits the officers of the land-forces to hold a court-martial and inflict punishments on the soldiers. Capital offenders are imprisoned and kept with rice and water till they can be sent to Europe.

The governor has not only the command of Fort St. George, but of all the settlements on the coast of Coromandel, and the west coast of the island of Sumatra; he is also captain of the first company of soldiers, as the second in council is of the next; yet his salary amounts to no more than three hundred pounds per annum. The great advantages made by the governor arise from his trading on his own account. On his going abroad he is paid as much respect as a sovereign prince. The guards are drawn out, the drums beat as he passes by, fifty or sixty armed blacks run before him, and some of the handsomest young fellows he can pick out of the European soldiers run by the side of his palanquin armed with blunderbusses: he is also attended by a numerous train of servants, and with the music of the country.

The six persons who compose the council have salaries, from a hundred to forty pounds a year, according to seniority; but these being great merchants, depend more on their trade than the company's allowance. There are also two senior merchants, who have forty pounds a year each; two junior merchants, who have thirty pounds; five factors, each of whom is allowed fifteen pounds; and ten writers, who have five pounds a year each. These dine at the company's table, and have lodgings provided for them; but it is said that no people in the world work so hard for such a trifling salary as the company's writers. Their friends indeed usually supply them with something to trade with, or no man would undertake so hazardous and tedious a voyage in the quality of a writer, who was sensible of the fatigue he must undergo.

Besides these officers, who transact the business for the company, they allow the two clergymen of the fort a hundred pounds a year each; the surgeon of the fort has a salary of about forty pounds a year; the judge-advocate is allowed a hundred a year; and the attorney-general, as he is called, has only twenty-three pounds

F f f

a year.

a year. The company have likewise two assay-masters of their mint, who have a hundred and twenty pounds a year each: but all these officers make very great fortunes.

As to their military forces, a lieutenant is allowed fourteen pagodas, or six pounds six shillings, a month; an ensign is allowed four pounds nineteen shillings a month; the sergeants have two pounds five shillings a month; the corporals and gunners of the fort one pound five shillings a month; and the private soldiers one pound two shillings and nine-pence a month each; upon which they may live very comfortably, and wear a clean shirt every day: and there is not a common soldier in the place who has not a boy to wait on him, the Indians suffering their children to serve the English for a trifle, on account of their learning their language.

This colony, however, produces very little of its own growth, and scarcely any manufactures for foreign markets, and the trade is in the hands of the Armenians and Gentoos. The chief things in which the English here deal are diamonds, calicoes, chintz, muslins, and the like. The diamond mines are but a week's journey from this city, which renders these jewels pretty plentiful. Some years ago there were computed to be in the towns and villages belonging to Fort St. George eighty thousand inhabitants, and about five hundred Europeans.

As the country does not produce food sufficient for the support of the people they have rice from Ganjam and Orissa, wheat from Bengal and Surat, and wood for fuel from the islands of Diu; hence they might easily be distressed by an enemy who has a superior force at sea.

In short, this city was actually taken by the French in 1746, who restored it after the peace. But in 1758 the French army, under the command of M. Lally, attacked it again; it was then defended by the colonels Laurence and Draper; but though the French entered the Black town, the garrison in the fort made so judicious and so brave a defence, that they at length obliged the enemy to retire and abandon the enterprize.

S E C T. XXIV.

Of the principal European Settlements from Madras to Cape Comorin; particularly Meliapour, Sadras, Pondicherry, Gingee, Fort St. David, Tanjore, Tranquebar, Negapatan, Trichinopoly, Madura, and Karical.

THREE miles to the south of Fort St. George is Meliapour, or St. Thomas, which was once the most considerable place on the coast of Coromandel. When the Portuguese settled there it was in ruins, and almost abandoned by the inhabitants. The Portuguese, on their rebuilding the city, gave it the name of St. Thomas, from that apostle, who is said to have been martyred there; and it is pretended, that his sepulchre was on a hill at a small distance from the town. The Portuguese, however, found some bones, which they readily supposed were those of that apostle; and having enshrined them, they became the objects of adoration. As this town had several villages under its jurisdiction, it was erected into a bishop's see, and its churches, monasteries, and private buildings were very magnificent. It was also regularly fortified; and, as hath been observed, became the greatest place of trade upon the coast of Coromandel; but the Portuguese were driven out of it by the Moors. It then became subject to the king of Golconda, but in 1666 it was taken by the French; but the Dutch apprehending that if the French got footing in India, they might dispute the empire of those seas with them, about four years after blocked up the town by sea with fifteen ships, while the king of Golconda laid siege to it by land. The town held out beyond expectation; but the Dutch landing seven hundred soldiers, they joined the besiegers and took the place; upon which the fortifications were destroyed, and it is at present a place of no strength. The inhabitants consist of the descendants of the Portuguese, Moors, Gentoos, and a mixture of other nations; but the people are in general poor, the trade being removed to Madras.

At an equal distance from Madras and Pondicherry is the Dutch settlement of Sadras. In 1759 Mr. Lally shewed so little respect to the neutrality which subsisted between the French and the Dutch, that, being resolved to make a magazine of this place, he turned out the Dutch soldiers and garrisoned it with French, pretending that he did it to prevent its being taken by the English.

Pondicherry, the capital of the French settlements in India, is a large, strong, and handsome town on the coast of Coromandel, situated in twelve degrees, twenty minutes north latitude, and in eighty degrees, thirty minutes east longitude from London. The ground on which it stands is low, and the ships cannot cast anchor nearer to it than about a mile and a half: nor can the boats or canoes come nearer it than the distance of a musquet shot; so that the blacks come in flat-bottomed boats to carry the men and merchandize to the fleet. The city is extremely regular in its buildings; for the streets are entirely straight, and the principal street, which runs from north to south, is half a league in length, and that which crosses the city in the middle extends twelve hundred yards. The fort is two hundred paces from the sea, and is very irregular, but it is built with bricks, covered with such fine plaster, that it resembles white marble. The city is also walled round, and has several great magazines, six gates, eleven forts or bastions, and four hundred and five pieces of cannon mounted upon the walls; besides bombs, mortars, and other pieces of artillery in the arsenal. The principal house is the governor's, and on the other side, towards the west, lie the company's gardens planted with fine vistas, which serve for public walks, with a large building richly furnished, where foreign princes and ambassadors are lodged: the jesuits have a fine house, in which are twelve or fifteen priests, who teach the youth reading, writing, and mathematics, but Latin is not taught in the city. There are only two or three priests in the house of the foreign missions, and about seven or eight in the convent of the Capuchins. Some private persons, who are rich, are very well accommodated in their houses, though they consist only of one story, as is usual in most of the cities of the province.

The Gentoos have two pagodas. These people are poor, but indefatigable and laborious, and, in reality, are the sole source of the riches of the city, and country. Their houses are usually eight fathoms in length, and six in breadth, containing about fifteen or twenty persons; but are all so dark that it is difficult to conceive how they are able to carry on their manufactures for want of light. Most of them are weavers, painters of stuffs, and goldsmiths. They pass the nights in their courts, or on the tops of their houses, lying almost naked on a mat, which is indeed common with them with the rest of the inhabitants. The best of the Gentooworkmen scarcely gains more than a penny a day, and yet this is sufficient to maintain not only the man, but his wife and children. Rice boiled in water, which is very cheap, and is almost their only food. Unleavened cakes, baked in the ashes, are their only bread, and that they seldom eat; but there is as good bread at Pondicherry as any in Europe.

Notwithstanding the dryness of the country, it produces a prodigious quantity of rice, which may be said to grow only in the water; this is owing to the indefatigable labour and industry of the Gentoos. At certain distances in the fields they dig wells from ten to twelve feet in depth, and fix a swipe on the top with a weight without, and a great bucket within. A Gentooworkman gets upon the middle of the swipe, and works it by leaning alternately with one foot on each side, singing, as he makes each movement, in the Malabar, their ordinary language, "And one, and two, and three, &c." Thus reckoning how many buckets he has drawn. One well being exhausted, he goes to another, and thus proceeds through the whole day. These people distribute and manage the water with surprising dexterity, and after the overflowing of the great rivers, preserve it in canals or ponds. But the Mahometans are as indolent as the Gentoos are industrious.

The governor-general of the company has twelve horse guards clothed in scarlet, with black facings, and a border of gold; their captain is clothed in the same manner, but with lace on the borders and seams. He has also three hundred foot guards, called Peons, who, upon occasion, are employed in other services. All this retinue attends the governor when he receives a king, a prince, or an ambassador extraordinary. In these ceremonies, in which it is thought necessary to conform to the pomp of the orientals, he is carried by six men on a palanquin, the couch and canopy of which are adorned with embroidery and tassels of gold.

The company also maintain a commandant of the infantry, a major, three companies of French infantry, and between two and three hundred topasses, who have been instructed in the Romish religion, and are clothed and disciplined in the French manner.

The company, as sovereigns of Pondicherry and its dependencies, have the privilege of coining money.

Pondicherry was taken by the Dutch in 1693, but restored to the French at the peace of Ryswick. In 1748 it was besieged by admiral Boscawen, but the periodical rains obliged him to desist: but in the next war the English were more successful; for in 1760, col. Coote formed the blockade of that important city by land, while an English fleet, being masters of the sea, prevented any succours being sent to its relief. By this disposition, and the vigilance of the British officers, the place was soon distressed for want of provisions, even before the siege could be undertaken in form, for the rainy season rendered all regular approaches impracticable, but that was no sooner over than batteries were erected, and, at length, a breach was made in the curtain. The west face and flank of the north-west bastion were ruined, and the enemies guns entirely silenced. While their walls were in this situation the garrison and inhabitants suffered by the most severe famine, and surrendered to Mr. Coote prisoners of war in January 1751. Of whatever detriment the loss of this important place might be to the French, it could not be of any great advantage to the English, after the conclusion of a peace: it was therefore restored by the definitive treaty concluded in 1763.

Thirty-five miles to the west of Pondicherry is Gingi, or Gingee, which is surrounded with mountains, and the roads, or more properly the passes which lead to it, begin between those mountains at about ten miles distance, and in them an army may be easily blocked up, except they are so numerous as to be able to keep up a communication with the neighbouring country. The place consists of two towns, called Great and Little Gingee, the first to the southward, and the other to the northward: but both are surrounded by one wall, three miles in circumference, which incloses the two towns, and five high and rugged rocks, on the summits of which are built five strong forts. The two towns are divided from east to west by a wall lined with cannon, which one of those five rocks defends as a citadel. There are four roads which lead to Gingee; but the place is inaccessible, except from the east and south-east. The Mogul besieged it in 1690, and though he carried on the siege three years, was at length obliged to desist.

The next place of consequence is fort St. David, a colony and fortress belonging to the English. It is situated five leagues to the south of Pondicherry; in twelve degrees three minutes north latitude, and in eighty degrees east longitude from London. It was purchased by the governor of Fort St. George for the East-India company in 1686, for the sum of 90,000 pagodas. The fort is pretty strong, and its territories extend eight miles along the shore, and four miles, within the land. The country is pleasant, fertile, and watered by several small rivers. The company have a good garden and summer-house, where the governor generally resides; and the town has gardens to most of the houses. This is reckoned a place of the greatest consequence to the English on this coast, next to Fort St. George, to which it is subordinate.

This settlement was taken by the French under the command of M. Lally, who besieged the town with an army of three thousand five hundred Europeans, and after battering the place from the sixteenth of April

1758 to the thirtieth, obliged the deputy-governor to surrender. After which the French blew up the fortifications, and reduced them to a heap of ruins. For this, says Mr. Cambridge, they cannot be condemned; "but the ruin of villas, and the injury done to many beautiful structures in the neighbouring country, will be a lasting reproach of wanton barbarity to the French." But victory soon forsook them, and they were obliged to surrender most of their own possessions to the English.

Tanjore, the capital of a kingdom of the same name, is situated to the south of Fort St. David, in eleven degrees twenty-seven minutes north latitude. The kingdom to which it belongs is bounded on the north by the river Coleroon, on the east by the sea, on the south by two powerful poligars, or lords, whose territories are small; and on the west by Trichinopoly. Near the mouth of the Coleroon the English have a fort called Davecotah, with some territory annexed, granted by the king of Tanjore, who was a friend to the English during the late war. In 1748 M. Lally marched up to the town of Tanjore, and while he was amusing the king with a negotiation, erected batteries, and began to fire upon the town, and had even made a considerable breach, when the Tanjoreans made a general sally, and at once attacked the French camp and batteries with such success, that M. Lally spiked up the heavy guns on his batteries, and made a sudden retreat.

The next settlement on the coast belongs to the Danes, and is called Tranquebar. A fort was built here in 1610, by a Danish admiral, with the permission of the governor of the country, and in 1621 it was purchased of the king of Tanjore. This town, which is situated in eleven degrees sixteen minutes north latitude, is about two miles in circumference, and surrounded with a good wall faced with stone. The houses of the Indians are mean; but those of the Danes and other Europeans are built of brick and stone, and sufficiently commodious; but have only the ground floor. The streets are wide, straight, and paved on the sides with brick. The town affords a pleasant prospect from the sea, which washes one half of the walls of the fort. There are here Danish missionaries for the propagation of the gospel; but they have been much opposed by the popish missionaries in this country. They have a school, with masters who understand the Malabar tongue, into which they have translated the Bible; they also instruct youth in the protestant religion, and have erected a printing press, and a paper mill. In 1699 this town held out a siege of six months against the whole forces of the king of Tanjore, and had not Mr. Pitt, the governor of Fort St. George, sent a reinforcement of English to their assistance, it would probably have been taken.

Negapatan, a town belonging to the Dutch, is situated in eleven degrees latitude, and was built by the Portuguese, who erected several churches there, with a monastery, a college of jesuits, and other public structures; but was taken by the Dutch in 1568. It is populous and well fortified, and in several of the neighbouring villages the Dutch have planted Christianity. The adjacent country abounds with rice, tobacco, and long pepper.

Trichinopoly is situated in a plain once crowded with rich villages and plantations of trees, but since the late war hardly any trace of either is left. The town is in the form of an oblong square, the longest sides of which face the east and west. On the north runs the river Cauvery, at less than half a mile from the fort. This town was formerly inclosed within a wall about twelve hundred yards in circumference round the foot of a rock, but as the inhabitants increased it was augmented to half of its present length; and the third augmentation being made, incloses the town as it now stands. It is at present near four miles round, fortified with double walls, and defended by round towers at equal distances, according to the eastern method of fortification. The ditch is near thirty feet wide, but not half so deep, and at different seasons is more or less supplied with water, but is never quite dry. The outward wall is built of a greyish stone, each of them from four to five feet long, and all of them laid endways; it is about eighteen feet high, and four or five thick. The other

is

is more properly a rampart thirty feet high, placed at about twenty-five feet within the wall.

A very extraordinary rock stands in the middle of the old town: it is about three hundred feet in height, and on the top of it is a pagoda. The buildings on this rock, and those cut out of the sides of it, are surprizing works in a country where the people have few tools to facilitate their labour. The town is well supplied by water courses from the river, which carry the water into large square tanks or ponds, that have a communication by aqueducts.

This city was taken by the Marattas on the last day of April 1741, after a siege of five months, and in the last war was the chief scene of our military operations, it being of the utmost importance on account of the strength of the fortification, and the large tract of country it commands. In 1753 the French made an attempt to take it by surprize; for on the twenty-eighth of September, at three in the morning, six hundred of the French, under the command of Mr. Maffin, scaled the outer wall, while two hundred more, and a body of sepoy, waited the event below, and prepared to second and join the first party. The French, persuaded that firing alone would frighten the garrison, turned two of our twelve pounders on the battery against the town, and discharged them with a volley of small arms, their drums beating, and the soldiers crying, *vive le roy*.

Captain Killpatrick being ill of the wounds he had received in a victory colonel Laurence had just gained over the French, the next officer in command came to him for orders. Mean while the French came down from the battery, and were between the two walls. There was a slight gate in the inner wall, which led into the town; their guide knew where it was, and had two petards ready to clap to it, while, to amuse the English, another party was to scale the inner wall. The scheme was well laid, and had not the French discovered themselves too soon, they might, perhaps, have entered the town. The English officer, on coming to the place attacked, found it difficult to discover the enemy's situation; but in his hurry and confusion he did not forget the gate, on the flanks of which he posted a number of men, with plenty of ammunition, to fire from thence incessantly, whether they heard or saw any thing of the enemy or not. And luckily he did, for both the guide and petardier were found killed within ten yards of the gate. The escaladers began to mount, and their commanding officer, preceded by his drummer, were the first who attempted to enter, in which the latter lost his life, and the officer, receiving a shot and a cut at the same time, was pulled within the town. The frequent flashes of fire, proceeding from the briskness of the attack and defence, were the only guide to the officer of the artillery for pointing his guns, which he did with such success, having loaded them with grape, as to shatter the ladders, wound and kill a number of men, and entirely disappoint their well-concerted scheme.

The enemy now only thought of making their escape, or screening themselves from the fire; some therefore leaped from the battery into the ditch; but the greater number lay hid under the parapet. The long-wished for day at length dawned, which discovered the enemy, who instantly begged for quarter, which was granted them, and three hundred and sixty-four Europeans were taken prisoners, sixty-five of whom were wounded; and forty private men and one officer were found slain.

Madura, the capital of a province thus named, and sometimes the residence of the prince, is situated in ten degrees five minutes north latitude, in the center between the east and west coast, and is a large town, fortified in the old way with two walls, round towers at proper distances, and a ditch. This city was taken by the English under the command of captain Caillaud in 1757.

Karical a French settlement, is situated in ten degrees thirty-five minutes north latitude, four leagues south of Tranquebar, and twenty-five leagues south of Pondicherry. The city, which is ancient, appears to have been very considerable, and has at present upwards of six hundred houses of stone and brick; besides a great

number formed of clay, and is said to contain five mosques, five large pagodas, nine small ones, and about five thousand inhabitants. It is seated on one of the branches of the river Colram, into which sloops may easily enter, and has the following places under its jurisdiction.

The fortrefs of Karcangery is built after the country fashion, it being flanked with eight large towers; it lies about a cannon-shot from the city of Karical, and half a quarter of a league from the sea-side. The French have blown up part of it, having judged it more convenient to settle at the entrance on the banks of that branch of the Colram which runs to Karical.

Tirumale Rayan Patuam is a very considerable town, lying to the south of Karical, and one of its dependencies, being about a league distant from it, and one thousand two hundred fathoms from the sea: it consists of five hundred brick houses, four mosques, four large pagodas, twenty-eight small ones, and twenty-five inns for the reception of travellers. According to a computation that was made at taking possession of it, it contained two thousand five hundred men.

The rest of the territory of Karical consists of nine towns, or villages, extending five or six leagues round. The soil is excellent, and produces great quantities of indigo, cotton, rice, and other grain. A great quantity of cotton and painted stuffs are also manufactured there.

We have now taken a view of the two capitals of Indostan, and of the principal European settlements on the eastern coast; we shall therefore return to the interior part of the country, and afterwards proceed with the western coast of the peninsula.

S E C T. XXV.

Of the interior Part of Indostan, particularly a concise Account of the Pattans, the Country and City of Cashmire, and of Lahor. With a general View of the Modern Divisions of the Peninsula, and some Observations on the peculiar customs of Malabar; and particularly of the Womens exposing their naked Breasts.

THE Pattans, a nation which in former times fled to the mountains on the borders of Persia, in order to escape the sword, or to avoid submitting to the conquerors of India, there formed a separate state, which was never thoroughly subdued by the Moguls; and occasionally exercised their depredations on the adjacent countries, without its being possible for the Moguls to extirpate them. Sensible that the climate and soil of the delicious plains would only serve to rob them of that hardness they contracted in the hills to which they were confined, they for a long time gave no indications of a desire to exchange them for more pleasing abodes, or a more accessible situation. This enabled them to brave the victorious army of Nadir Shah, whose troops they quietly suffered to penetrate into Indostan, and waited his return with the spoils of that country. They then harassed his troops in the straights and defiles of the mountains, and shewed that they were so much masters of the passes, as to force him to come to a composition with them for leave to pass them. Since that time they have imitated the Persian conqueror in plundering the city of Delli; and the chief of that people has at length even placed Timur, his son, on the throne of Indostan.

Cashmire, one of the most delightful provinces in India, is situated on the north of that empire, and is divided from Tartary by Mount Caucasus, and, according to Berdier, who was many years in India, is but thirty leagues in length, and ten or twelve in breadth. It enjoys a clear healthful air, as temperate as any in Europe, and a soil so well cultivated and accommodated with all the necessaries of life, that it is styled the Paradise of India. It is surrounded with mountains rising above each other, the lower abounding with cattle and all kinds of game, and the higher covered with snow, which melting forms many rivulets and several small lakes, rendering the country so fruitful, that it resembles a spacious garden of evergreens. It abounds with fruit-trees

trces of various sorts, as well as with saffron, hemp, rice, and other corn, which, together with the mildness of the climate, and the villages scattered among the trees, renders this country so pleasant, that Bernier says, he was astonished at finding himself suddenly transported from the stifling heat of the torrid zone into the temperate freshness and fertility of Europe. The woods also abound with bees, and the rivulets joining their streams form the river Chenas, by which goods are carried through the greatest part of the kingdom into the Indus.

The snowy mountains are clear at the top, and, like Mount Olympus, rise above the clouds. Bernier says, that among them are many cascades; and that one of the Mogul emperors ascended the highest of them, with a long train of elephants, on which his ladies rode; when one of them, being frightened at the view of a precipice, fell back on the next, and the rest behind one upon the other, by which means several of the women were killed, and all the elephants lost. The same author adds, that in less than an hour he felt both summer and winter; for on his ascending this mountain he was scorched by the sun; but when he reached the top he found snow, with a misting rain, and a cold wind; and within less than two hundred paces, he perceived one wind from the south, and another from the north, which he imputes to the different exhalations issuing from the mountains.

The people who are Mahometans, are of the European complexion, ingenious, witty, and industrious; and the women are remarkable for their beauty, on which account they are purchased, as hath been already mentioned, by the principal omrahs.

The people employ themselves in making household furniture, which they send to different parts of the Indies, and are excellent at varnishing; but their principal trade is in the stuffs, called chales, one sort of which is made of their own wool, which is extremely fine; and another of wild goats hair, which they have from Tibet. Some of the pieces are valued at a hundred and fifty rupees, but others are not worth more than fifty; they are about an ell and a half long and an ell broad, and are embroidered at the ends. In winter both sexes wear them on their heads, and throw one end over their shoulders.

The principal city of the province is of the same name, and is situated in a plain at the north end of a lake formed by the river Chenas. In this lake are many islands, and from it a river runs through the town, which has two bridges over it. Several of the Great Moguls have built palaces here, adorned with beautiful gardens, water-works, and canals faced with freestone.

The city is a league long, and half a league broad, but has no walls; the houses are of timber, well built, and three stories high, with gardens and canals both towards the lake and the river, on each of which the citizens have pleasure-boats, and the banks are adorned with trees. According to Bernier the city is encompassed by mountains in the form of a semicircle, at the distance of about two miles; and there are fine walks on both sides the lake adorned with arbours. There are also many gardens on the adjacent hills, with a mosque, a hermitage, and several houses of pleasure, richly painted and gilt, and fine walks of trees.

Lahor, a province to the north of Cashmere, was conquered by the Pattans some years before they obtained the empire of Indostan, and is situated in thirty-two degrees north latitude, which was the residence of the chief of that nation. It is adorned with mosques, public baths, caravan-seras, palaces, and gardens; and as there are many Gentoos settled in it, there are also several pagodas. There is likewise an antient palace of the Moguls, on the walls of which are painted the exploits of several of those emperors. What is most remarkable with respect to this city is, that here begins the road which leads to Agra, which some travellers say is five hundred miles in length, and is finely planted with tall trees on both sides, forming in a manner a continued arbour; at every mile and a half is a turret, and along it are little inns for travellers.

As to the other places in the north of the Mogul's dominions, we have no certain account of them, and therefore shall not amuse our readers with the contradictory relations of former authors, or with setting down boundaries that were never marked out; or the latitude of places in which all travellers disagree.

It has already been observed from Mr. Cambridge, that the sovereign possesses only a third, and that the least valuable part of his own vast empire; and from the same author we shall here add, the general divisions that gentleman has given of the peninsula. "Bengal, the smallest but most fertile province, is governed by a viceroy. The other division, called the Deekan, extending from about Balafore to Cape Comorin, is also delegated by the Mogul to another viceroy, of exceeding great power, he having within his jurisdiction seven large territories, to which he has the right of nominating seven nabobs, or governors of provinces. In all parts of India are still large districts, which have preserved, with the Gentoo religion, the old form of government under Indian kings, called rajahs. Such are Maissore, whose capital is Seringapatam, and Tanjore, whose capital is also named Tanjore. There is also among the woods and mountainous part of the country several petty princes or heads of clans, distinguished by the name of Polygars. These are all tributary to the nabobs, and those to the viceroy, whose capital is Aurengabad. The Carnatic is that part of the Deekan which comprehends the principal settlements of the Europeans."

Nothing can be imagined more different than the customs and manners of the Malabars, and those of the inhabitants of the more northern parts; though they are only divided by an imaginary line, which begins at Mount Dilly, in the latitude of twelve degrees north; for here the government and people wear a new face and form. Malabar comprehends a tract of land which extends to Cape Comorin, and is bounded within land by that vast chain of mountains which separates that coast from Coromandel, and extends through Indostan, till it loses itself in the extremities of Northern Tartary.

Among the singularities of this country, one of the most remarkable is, that the women are not allowed to cover any part of their breasts, to the naked display of which, says Mr. Grose, they annex no idea of immodesty, which ceases by their becoming familiar to the eye. Most Europeans at their first arrival, continue that ingenious author, experience the force of temptation from such a nudity, arising from the ideas to which they are accustomed by education: but it is not long before these impressions, by their frequency, entirely wear off, and they view them with as little emotion as the natives themselves, or as any of the most obvious parts, the face and hands. This custom is in some parts of Malabar more rigorously observed than in others.

S E C T. XXVI.

Of the province of Sind, or Sindy, and of Tatta its Capital.

WE shall now describe the principal places on the west of India, beginning with the river Sind, or Sindy, the antient Indus, which is navigable for the country vessels as high as Cashmere. One branch runs from the westward, and others through several large provinces from the north east. These vessels are called kifties; they are flat-bottomed, and have one mast, carrying a square sail. The cabins extend from stem to stern, and in each is a kitchen and necessary, which opens into the water. These cabins are let to traders, and the hold being divided into separate cabins, and every person having a lock to his own, has his goods always ready whenever he finds a market.

The province of Sindy, situated on the banks of that river, seldom knows the misery of famine; for the Indus overflows all the low grounds in the months of April, May, and June; and, when the floods retire, leaves a

G g g

fat

fat lime: it is then sowed, and seldom fails of bringing forth a plentiful crop.

The people manufacture silks, calicoes, and cotton cloths of several kinds; and also chintz and very beautiful counterpanes. They likewise make fine cabinets, both japanned and inlaid with ivory.

Those in the government are of the Mahometan religion; but there are many Gentoos to one Musulman.

The inland part of the country produces lapis-lazuli, salt-petre, sal-amoniack, borax, opoponax, assa-fœtida, bezoar, and raw-silk.

The city of Tatta is situated in a spacious plain, about two miles from the river Sind, from which canals are cut to bring water to the city and gardens, which are well stored with fruit and flowers. It is about three miles long, and one and a half broad. On its west side is a citadel, with barracks and stables said to be capable of lodging several thousand men and horse; and there is also a palace for the nabob. The Portuguese had formerly a church here, which is now abandoned.

The country around this city is almost level, and overgrown with shrubs and bushes, in which the robbers lurk in order to attack travellers.

At the distance of about four miles from Tatta are forty-two fine large tombs, the burying-place of some of the kings of Sind, when that country was governed by its own monarchs. Mr. Hamilton went into the largest; this was built in the form of a cupola, and in the middle of it stood a coffin about three feet high and seven feet long, with some others of a smaller size. The cupola was of a yellow, green, and red porphyry finely polished; and, being set chequer-wise, had a very pleasing effect. This tomb is about thirty feet high, and twenty-one in diameter, and was then said to be the burying-place of the last king of Sind.

S E C T. XXVII.

Of the Province of Cambaya, or Guzurat, Amadabad its Capital, Cambaya, and the City of Diu.

GUZURAT, or Cambay, is situated to the south, of Sind, and extends from nineteen degrees odd minutes to near twenty-five degrees north latitude, and is upwards of three hundred miles from north to south, and four hundred miles from east to west. The bay of Sind on the north-west, and the bay of Cambaya on the south-east, form a great part of this province into a peninsula.

Amadabad, the capital city of Guzurat, and the seat of the viceroy, is situated in twenty-three degrees forty minutes north latitude, and seventy-two degrees east longitude from London, and is about one hundred and forty miles to the northward of Surat. It stands in a fine plain, watered by a small river, which, during the rains, is overflowed. The city is inclosed with a wall of brick and stone, strengthened by towers, and has twelve gates. The town, with the suburbs, is three or four miles in length, and the streets are generally wide, particularly the principal street, which is no less than thirty paces in breadth. The Meidan-shah, or king's square, is seven hundred paces long and four hundred broad, and has trees planted on every side. On the south stands the great caravanera for the lodging of strangers, and on the west side of the square is the castle: it has also several other public buildings. Near the Meidan is one of the palaces of the Mogul, and over the gate is a large balcony, where the trumpets and other country music play in the morning, at noon, and in the evening. The English factory is in the middle of the town, and the Dutch have another in the great street, and their ware-houses are generally filled with rich Indian goods.

In this city are many mosques belonging to the Mahometans; but the most noble of these structures is one called Juna Mesgid, or the Friday's mosque, to which vast numbers resort on that day. It has an ascent of several large steps, and before it is a square cloister one hundred and forty paces in length, and a hundred and

twenty in breadth; it is adorned with twelve domes, and has an open paved square in the middle of it. In the front of the mosque are three large arches, and on the sides two great doors which open into it, over which are very high minarets, or steeples, from whence they call the people to their devotions. The chief dome is surrounded by several small ones and two spires. The whole pile is supported by forty-four pillars, which stand in two rows, and the pavement is of marble. There are also a great number of pagodas at Amadabad.

This city is so intermixed with groves and gardens, that at a distance it resembles a forest. The king's garden, which is situated by the river-side without the walls, is filled with all the fruits of India: it is in the form of an amphitheatre, several parts of the garden rising gradually one above another, and on the highest is a terrace from whence there is a fine view of the country villages for several miles.

Four or five miles from Amadabad is the village of Serquech, where are the tombs of the former kings of Guzurat. These are large square buildings, with three great arches in each front, and over them many lesser ones. In the middle is a magnificent dome, and there are several small ones on the sides.

Cambaya is situated in the twenty-third degree of north latitude, at the bottom of the gulph of the same name. It is, at least, two leagues in circumference, and is surrounded with a brick wall, which has towers at proper distances. It has also a large old castle. Without the walls are very extensive suburbs, and fifteen or sixteen public gardens. The streets of the city are spacious, straight, and handsome, and the houses built with brick dried in the sun; but, as great part of the trade is removed to Surat, it is not now above half inhabited. The Banyan inhabitants are so beautiful to the monks, that they perfectly swarm here; and in this city was formerly an hospital for several sorts of beasts, which is now ruin to ruin. It is said that the tide rushes so furiously into the bay of Cambaya, that the swiftest horse cannot keep pace with it.

There are vast numbers of peacocks in the neighbouring fields and woods, which are taken in the night in the following manner: a flag, with a peacock painted on both sides, and two lighted candles at the top of the staff that holds it, is carried to a tree on which they roost; when the peacock being surprized at the light of the candles, and stretching out its neck to the end of the stick, is caught by a noose with a slip knot, which is drawn by the man who holds the flag. The flesh of the young ones is white, well-tasted, and not much unlike that of a turkey.

The city of Diu is seated upon an island of the same name in the gulph of Cambaya, in the latitude of twenty degrees forty minutes. The island is about three miles in length and one in breadth, and is separated from the continent by a narrow channel. The Portuguese possessed themselves of it about the year 1515; and, though it is naturally very strong, they added to it all the advantages of art. The city is pretty large, and encompassed with a stone wall, with battions at convenient distances well furnished with cannon; the harbour is secured by two castles that can bring above a hundred large cannon to bear upon its entrance; and by sea it is fortified by nature with dangerous rocks and high cliffs. This is one of the best built and strongest cities of India; and its edifices of free-stone and marble are sufficient witnesses of its ancient grandeur and opulence. It contains five or six fine churches, which standing on a rising ground, of an easy ascent from the great castle, and each of the great churches gradually rising higher than the other, shew their front to the sea to great advantage, and within they are adorned with images and paintings. It has the advantage of a very good port, where the Portuguese fleets were usually laid up while they possessed the dominion of the Eastern seas, and here the Moors and all other traders in the Indies were obliged to take out their passports before they were permitted to sail any farther towards the east. At present little of its ancient traffic is left, the greatest part of it being removed to Surat, and the small commerce still in the hands of the Portuguese is carried on under the

the protection of Gentoo colours; for they believe their effects safer with them than under the flag of Portugal, formerly so much respected in those seas. The Portuguese in the castle and city do not exceed two hundred, and the rest of the inhabitants are Banyans, of whom there are said to be about forty thousand, but few of them are rich, the insolence of the Portuguese rendering it unsafe for strangers of great property to dwell among them.

The king of Portugal has about twelve thousand pounds per annum in poll-money paid from hence into his treasury, and the customs and taxes amount to about six thousand pounds more; but was this island in the hands of some industrious European nation, it might be made the best mart-town on the coast of India for carrying on a trade up the Indus.

SECTION XXVIII.

A particular Description of the City of Surat; with the Manners of the People. An instance of the strange Effect of Opium. The Manner in which the Gentoo Women of that City bathe in the River; the Manufactures carried on there, and the Manner in which the English lately became possessed of the Castle.

SURAT is situated in the province of Guzurat, a little to the northward of Bombay, about sixteen or twenty miles up the river Tappee, which has nothing remarkable, though the city on its banks is perhaps one of the greatest instances in the known world of the power of trade to bring in so small a time wealth, arts, and population, to any spot where it can be brought to settle.

No longer ago than in the middle of the last century a few merchants repaired to this place, and under the shelter of an old insignificant castle, built a town, which in a few years became one of the most considerable in the world, both for its trade and size, it being at least as large, and as populous as London within the walls, and contains many good houses according to the Indian architecture. Soon after its taking the form of a town, a wall was built round it to defend it from the insults of the Marattas, by whom it had been twice pillaged; but this wall is far from being capable of standing a regular siege, and the castle, which is by the river side, and which you pass in your way up to the city, seems a strange huddle of buildings, mounted here and there with cannon without order, or meaning, and without the least attempt at any thing like military architecture.

Before the English East-India company obtained the possession of Bombay, the presidency of their affairs on the coast of Malabar was held at Surat; and they had a factory established there, which received from the Mogul government several important privileges, and even after the presidency was transferred to Bombay, the factory was continued at one of the best houses in the city, and this becoming too little to contain their effects, they hired another nearer the water-side, which obtained the name of the New Factory.

Mean while this city flourishing extremely, it became the centre, and indeed the only staple of India, it being much frequented on account of the vent goods of all sorts met with there, from whence they were distributed to the inland provinces; and at the same time the manufactures of the country form a considerable part of its commerce. Thus there is hardly any article of merchandize that can be named but is always to be found here, almost as readily as in London itself. The company annually carries on a large trade in piece-goods, especially of the coarse ones, hyrampauts, chelloes, and others, for the Guinea market.

While the Mogul government was in its vigour, there was such a shew of justice, as induced the merchants of all religions and denominations to shelter themselves under it, particularly the Gentoos, who came to reside here, not only from their preferring the Mogul form of government to their living under that of the Gentoos, who had none at all; but on account of trade. At that time no flagrant acts of oppression were committed;

but the merchants, from personal pique or jealousy, would sometimes find means to engage the government to interfere in their quarrels, to which it was not averse, being sure to be the only gainer.

Besides the number of Gentoo inhabitants of Surat, and in the suburbs and neighbouring villages employed in trade, money-changing, brokerage, and manufactures, they have frequently posts under the Moorish government; as collectors, surveyors of the customs, and other offices of trust, where accomptantship is required, in which they generally excel the Moors. And it has been found that none are more rigorous exactors over the Gentoos, nor more ready to oppress them, than these Gentoos themselves.

The streets of Surat are irregularly laid out, but have one advantage which renders them agreeable to those who walk through them during the heat of the day; that is, they are sufficiently wide at the bottom; but the stories of the houses project so far over each other, that the uppermost apartments on each side of the street are so close, that people may easily converse from them, by which means the streets are overshadowed, and a free ventilation is preserved. But the shops in this great trading city have a very mean appearance, the principal dealers keeping their goods chiefly in warehouses, and selling by samples.

In summer, when the heats are most intense, though they are never so intolerable as in many other places, the principal inhabitants have country houses a little way out of town, where they reside, or go in parties to enjoy themselves in their gardens and frescoes, by the side of the waters with which they are furnished. The English company in particular have a very pleasant garden kept for the use and recreation of the gentlemen of the factory, though the incursions of the Marattas have sometimes rendered these rural recesses very unsafe.

While the communication with the country is kept open, there is no better place in the world for provisions; for besides the abundance of every article, which an unbounded importation brings into the market, the natural productions of the soil are excellent in their kind. All manner of eatables are at a reasonable price, and as good as can any where be found, particularly the wheat of Surat is famous all over India for its remarkable whiteness, substance, and taste, and nothing can exceed their roots and fallads. There are likewise many kinds of wild fowl and game exceeding cheap. The Europeans depend chiefly on importation for their wines and spirituous liquors, few of them relishing the distillery of the country, which produces various strong spirits to which the natives give very odd names, as the spirit of deer, spirit of mutton, spirit of goat, which arise from their throwing into the still a haunch of venison, a joint of mutton, or a quarter of a goat, which respectively give their names to the distillation, and this flesh they imagine gives the liquor a mellowness and softness that corrects its fiery spirit.

Most of the hard labouring people of Surat, and especially the hamals or porters, who get their living by carrying goods to and from the warehouses, and bear loads of a very great weight, have contracted such a habit of taking opium, that an author of great veracity says, he has been credibly assured, that some of these fellows will take at one dose three copper gorze weight of this drug without danger, which is considerably above an ounce, and pretend that it enables them to work and carry heavy burthens.

Many of the great and wealthy also contract a habit of it, from their considering it not only as a high point of sensuality, on account of the pleasing deliriums they experience from it, but as an extraordinary provocative; they usually take it in milk, boiled away from a large to a small quantity, and when they would put an end to its operation, they swallow a Spoonful or two of lime juice, or any other acid of the same kind; but those who use it, by thus forcing nature, wear out its springs, and prematurely bring on all the inconveniences of old age; but this is of little weight with the generality of the Orientalists, who are always more actuated by present enjoyments, than a regard for the greatest remote advantages.

They

They pretend that opium has a strange paradoxical mixture of effects in its operation, causing at once a seeming heaviness of the head, an apparent sleepiness of the eye, and yet an extraordinary watchfulness; in confirmation of which the people of Surat relate the following story: One of the governors of the town receiving a visit from a Gentoo rajah his friend, at a garden without the city walls, they met with each their guards and attendants. As they were walking the governor took notice of the rajah's guards, who were squatted down after their manner, in an open guard-room, with their heads leaning on their naked swords, and in appearance either dozing or fast asleep. The governor observed with a smile to the rajah, that he had a very just opinion of his good faith, since he would venture this interview with guards in such a condition from the opium he knew it was their custom to take. "That," says the rajah, is "a mistake, and if there be any body here for whom thou hast no concern, bid him pluck a flower as softly as he pleases out of any of their turbans." The governor instantly ordered a person, who was near him, to do what the rajah had mentioned. The man obeyed; he proceeded with the utmost caution, and approaching him who seemed the most overcome with sleep, snatched off the flower. The rajah's guard felt what was done, and without more ceremony, at one stroke cut off his arm, and the rest were instantly on their feet. Thus the governor was convinced of their vigilance at the expence of a servant, who, whether he was innocent, or so guilty as to deserve being exposed to such a trial, was probably thought of no consequence under that arbitrary government.

Bang is also much used at Surat, as well as all over the east; it is an intoxicating herb, and it is difficult to conceive what pleasure can be found in the use of it, it being very disagreeable to the taste, and so violent in its operation, as to produce a temporary madness; for it causes some to run furiously about killing all they meet, without any distinction, till, like mad dogs, they themselves are knocked on the head.

The Gentoo women of the best fashion at Surat make no scruple of going to the river, and bathing publicly in the sight of the men. They indeed go into the water with their cloaths on, but wetting them makes them cleave so close to their bodies that they perfectly express the turn of their limbs. When they come out of the water, and change their wet for dry cloaths, they shift themselves with such dexterity, that though it be done openly not the least glimpse of any thing immodest can be seen.

All religions are tolerated in this city, and nothing can be more political in a place of such universal trade. The Moors, who have the government in their hands, here seem to lay aside that rigour, and that fondness for making of proselytes, they have shewn in most other parts where their religion prevails. Thus, if they take an European into their service in quality of gunner, for they imagine all Europeans are born engineers, they never give themselves the least concern about his religion. The inhabitants of Surat and the neighbouring country are commonly very industrious, and have a number of manufactures; but the most considerable of them is the attasses, or sattins flowered with gold or silver, which have a rich substantial look, but are not performed in a very elegant taste, the flowers being ill-fancied, and without air: and the red ground mostly used, dull, and unpleasant.

A few shawls are manufactured here, but the finest sort come from the province of Cashmire, they being made of a peculiar kind of silky hair, that produces from the loom a cloth beautifully bordered at both ends, with a narrow flowered selvage. The pieces are about two yards and a half long, and a yard and a half wide; these, without the trouble of making up, serve the natives for a wrapper or mantle. The price is said to be from ten pounds and upwards to fifteen shillings, and though it is extremely fine, it has a substance that renders it warm, and the fine ones are so pliant as to be easily drawn through a ring for the fingers.

The manufacturers have commonly their work bespoken by the wholesale merchants; but when this is not

done, the workmen repair to the bazar or market-place, where they stand holding up the piece to any chapmen that will give the price, and seldom return without disposing of them; for there are a number of petty dealers, who thus purchase goods at the first hand, and afterwards sell them in quantities to the merchants.

This being the only sea-port of any consequence in the dominions of the Mogul that is not possessed by the Europeans, the inland trade, particularly to Delli and Agra, employs a number of caravans in distributing the goods imported. But the roads are never perfectly safe, on account of the independent rajahs, and the troubles of the country.

A constant intercourse is preserved betwixt Surat and Bombay, not only by sea, but by foot passengers over land, hired at a moderate rate. They are very expeditious in these journeys, and commonly use opium to preserve them from weariness, and by this means keep running and dozing, as it were with their eyes open, without feeling the fatigues of the way.

The governor of Surat keeps his seat of administration at what is called the Durbar, where he is generally present in person, and gives his orders. All actions of a criminal and civil nature are brought before him, and summarily dispatched in the eastern manner. He observes one piece of state that appears pretty remarkable: he never, on any material affair, speaks to his attendants; but writes his orders in the Persian tongue upon small slips of paper that lie before him ready for that purpose, and when written must be obeyed without reply. These are afterwards brought him, and being strung serve as a record of his actions.

It will not be uninteresting to the English reader to see here an account of a remarkable revolution which has happened in this city; a revolution that must be attended with considerable advantages, with respect to our India company.

The late Mogul, moved by his zeal for the Mahometan religion, and a concern for the interests of commerce, in order to keep the seas open between Surat and the Persian and Arabian gulphs, had been at the annual expence of fitting out a large ship to carry pilgrims to Judda, which is at no great distance from Mecca, and to protect the trade of Surat. For this purpose he granted his admiral the Siddee, a revenue called the tanka, of the yearly value of three lacks of rupees, arising partly from some adjacent lands, and partly from the revenues of Surat, which were annually paid him by the governor; but he had not the least title to any thing independent of the marine.

At length the government of Surat being backward in their payments, and with-holding from the Siddee great part of the sum, that officer sent some of his cruizers into the river of Surat, when the monsoon was setting in, and made the season a pretence for remaining there. Siddee Mussoot took this opportunity of getting some footing in the government, and seized on the castle, which he held till his death; after which he was succeeded by his son in 1756.

Mussoot not only kept the castle, but appropriated to his own use one third of the revenues of the town; and another third had for a long time been annually paid to the Marattas, who farm them out to an officer who resides at Surat; and as they are masters of the whole country up to the very gates, it has been thought expedient to pay them duly their allotment, rather than subject the inland trade to be interrupted by them. The Siddee at length deposed the governor, and placed Meah Atchund in his room; the city was then reduced to a state of anarchy; for the lawless behaviour of the Siddee's son filled the city with riots and murders, while the new exactions and burthens upon trade grew intolerable.

Hence in the year 1758, the principal merchants and inhabitants earnestly solicited Mr. Ellis, the English chief, to persuade the presidency of Bombay to fit out an expedition for taking possession of the castle and tanka, and entered into an obligation to be responsible for five years for any deficiency in the revenues of the castle and tanka, which were rated at two lack of rupees per annum;

annum; and as Pharrafs Khan or Cawn, who had been deputy-governor to Meah Atcund, had regulated the police to the satisfaction of the whole city, it was proposed to have him for governor.

In the beginning of the year 1759 Mr. Spencer, who succeeded Mr. Ellis, informed the governor and council of Bombay, that though Meah Atcund was still governor of the town, the Siddee left him so little power that he was not even allowed to nominate the officers that properly belonged to him. The dread of the continual ravages, and the frequent murders now committed with impunity, struck such terror into the inhabitants, that many people of substance left the place, and those who staid there became still more solicitous that the castle should be in the hands of the company, from their confidence in the humanity and justice of their government. There seemed but one thing to be apprehended, which was, lest Atcund or the Siddee, should, in distrust of their own strength, fly to the desperate resource of calling in the Marattas.

The presidency of Bombay at length complied with the earnest solicitations that had been offered them, and, in order to secure themselves from any danger from the Marattas, either by sea or land, desired admiral Pocock to join the enterprize with two ships of his squadron. The admiral consented to their request, and gave orders for the Sunderland and Newcastle to countenance the enterprize. The Siddee, who enjoyed the tanka, on condition of keeping up a fleet for the Mogul, had so neglected the marine, that it was incapable of opposing the company's ships. Captain Maitland was now appointed to take the command of eight hundred and fifty men, artillery and infantry, and fifteen hundred sepoy; which, being put on board the company's vessels, landed on the ninth of February. On the captain's approaching the town he had a smart engagement, which lasted four hours, with some of the Siddee's people who had taken post in the French garden. A battery was then erected, and a brisk fire kept up against the castle from two twenty-four pounders and a thirteen inch mortar, but without effect; when a council of war being called, it was determined to make a general attack; and, in pursuance of this resolution, the company's grabs and bomb-ketches warped up the river in the night, and anchored early in the morning opposite the Bundar, or custom-house, which was possessed by the enemy; and a general attack began from the vessels and a battery, in order to drive the enemy from their batteries, and to facilitate the landing of the infantry. The firing lasted till after eight, when the boats putting off, the men were landed, and putting the enemy to flight, took possession of all the outer town. Three mortars were then planted at the distance of about seven hundred yards from the castle, and five hundred from the inner town; the bombarding and cannonading, which continued a whole day and a night, threw the besieged into such consternation, that they never returned a gun.

Pharrafs Cawn's friends, who had not made the least effort in his behalf now signified, that they chose he should be naib, or deputy-governor; and that the government should be continued to Atcund: it was therefore agreed to secure the government to him, on condition of his making Pharrafs Cawn naib, and establishing the English in the possession of the castle and tanka. To this Atcund readily agreed, and opening the gate of the inner town, ordered a party of men to bring the Siddee to terms, who was now sensible that it was impossible for him to hold out against the combined forces, and the general voice of the people. After many repeated messages, and a variety of proposals, it was at last granted, that the Siddee's people should have liberty to take away all their valuable effects, and even the common furniture of their houses. This was done with the greatest regularity, and the English were peaceably put in possession of the castle, and tanka. The guns and ammunition found in the castle, with the vessels and naval stores, as part of the tanka, were secured for the company, till the Mogul's pleasure was known; these advantages were solicited and obtained, and grants arrived appointing the company admiral to the Mogul, before the murder of that prince and the revolution at

Delli. Thus was accomplished a revolution of general benefit; peace and good government was restored to the city, and the English acquired a valuable possession, to the universal satisfaction of the inhabitants.

S E C T. XXIX.

Of the Portuguese Settlements of Daman and Bassaim, and of the City of Aurengabad.

DAMAN, a Portuguese factory, fifty miles south of Surat, is, like their other Indian factories, dependent upon Goa, whose archbishop has a vicar-general here. The Portuguese first took it in 1535, and it being recovered from them, they took it again in 1559, and have kept it ever since, though the Moguls have made several attempts to regain it; but they have made it so strong as to baffle all their force. Aurengzebe besieged it about the middle of the last century with above forty thousand men; but the garrison making a sally upon a part of his camp guarded by two thousand elephants, those unwieldy animals were so terrified by the fire-works, that they broke in upon his camp and trampled down half of his army; upon which he raised the siege, and never more made war upon the Christians.

It is situated in a good air, at the mouth of a river of its own name, which running through it divides it into the Old and New Towns. The New Town, which stands on the south of the river, is built in the Italian taste, and most of the houses stand by themselves, and have an orchard or garden. They are tiled, but are generally only one story high, and have windows of transparent oyster-shells. It is about two miles in circumference, and has four good bastions, with a small in-reinforcement cast up on the south and east sides; and on the other two sides a branch of the river enters its ditch. The walls have a platform and two gates. The port, which is but small, is formed by the river betwixt the two towns, but is quite dry at ebb, so that no vessel can enter it except at high water, and the great ships only at the spring-tides. Its entrance is defended on the side of the Old Town by a small fort of white stone, called St. Salvadore, with three bastions.

The Old Town is in a manner deserted, and the New is far from being so populous as might be expected from its extent: however, there are some manufactures of silk carried on there, with which they furnish the market of Goa; and there are several villages and islands belonging to it, which pay tribute to the Portuguese.

Bassaim is a fortified city belonging to the crown of Portugal, and situated about eighteen leagues to the south of Daman, on a small island separated from the continent by a rivulet. The walls are pretty high, and about two miles in circumference. In the middle of the city is the citadel; it has three or four churches, a college, an hospital, and some monasteries and convents. It is a place of small trade, for most of its riches lie useless in the Portuguese churches, or in the hands of indolent country gentlemen, who spend their days in ease, pride, and luxury, without giving themselves the least concern about trade, or having any feeling for the poverty of the rest of the people.

To the east of Bassaim, in the latitude of twenty-one degrees, is the large and populous city of Aurengabad, the capital of the Deckan, and the seat of the viceroy, whose power is exceeding great, it extending from the province of Bengal to Cape Comorin, and has the power of nominating seven nabobs. The city carries on a considerable trade, and is situated in a very fruitful country, one hundred and forty miles south-east of Surat.

S E C T. XXX.

Of the Island and City of Bombay. Its Situation, Name, Climate, Fortifications, and other Buildings; with an Account of the Inhabitants and Government.

BOMBAY is an island seated in eighteen degrees forty-one minutes north latitude, on the coast of
H h h Decan,

Decan, the high mountains of which are full in view, and is so situated as, with the winding of other islands along the continent, to form one of the most commodious bays in the world, on which account it received its name of Bombay by a corruption of the Portuguese word *Buon-Bayha*, or Good Bay; for the harbour is so spacious as to contain any number of ships, has excellent anchoring ground, and from its circular form can afford them a land-locked shelter against any winds to which its mouth is exposed.

This island, which is seven miles in length, and twenty in circumference, is admirably situated for the center of the commerce between the Malabar coast, the gulph of Persia, the Red Sea, and all the trade of that side of the great Indian peninsula, and the northern parts adjoining to it; which are therefore properly subordinate to the government of the president who resides there.

Though this island is within the tropics, its climate is far from being intolerable with respect to heat, and is never so cold as to be disagreeable to an European constitution. In the very hottest season, which is that which immediately precedes the periodical returns of the rains, the inhabitants seldom want the alternate refreshment of land and sea-breezes, and there are but few days in the year when the heat is excessive; and even these may be rendered supportable by avoiding violent exercise, keeping out of the unabated heat of the sun, and by a light diet. Great care should also be taken of your not exposing yourself to the night-dews, and a too quick transition from a state of open pores to the perspiration being entirely shut up. Bombay had long the infamous character of being the burying-ground of the English; but experience, purchased at the expence of a multitude of lives, has now rendered the causes of this mortality more known, and consequently enabled people to guard against them; and the island is better supplied with able physicians and surgeons. Thus the climate is no longer so fatal to the English inhabitants; it is even incomparably more healthy than many other of our settlements in India; and this place, the name of which used to carry terror with it, is no longer to be dreaded, provided that common measures of temperance be observed, without which the tenure of health must in any climate be very hazardous.

The seasons may properly be divided, as in the other places near the tropics, into the wet, which continues about four months, and into the dry, which lasts about eight months in the year. The setting in of the rains is generally ushered in by a violent thunder-storm, usually called the elephanta, a name it probably received in the Asiatic stile from the comparison of its force to that of the elephant. This is a pleasing prelude to the refreshment occasioned by the rains moderating the excessive heat, then at its height. They begin about the twenty-eighth of May, and cease about the beginning of September; after which there is no more than a few transient showers. Though this rainy season is very hot, yet in any dry intervals, when the sun shines out for a few hours, it is accounted the pleasantest; and the end of it, and some days after, is esteemed the sickliest time in the year, from the exhalations forming a kind of faint vaporous bath, from which those who lodge in the highest apartments are least in danger.

The trading vessels of the country are laid up during this season, especially those belonging to the black merchants, who send none to sea till after a festival at the breaking up of the rains, when they consecrate a coco-nut, which they gild and ornament, and throw it, by way of oblation, into the sea.

The chief town, which is also named Bombay, has a castle, which is a regular quadrangle, well built of strong hard stone. In one of its bastions that faces an eminence, called *Dungharee-point*, is a large tank, or cistern, hollow, which contains a great quantity of water, that is constantly replenished by the periodical rains. There is also a well within the fort; but the water is not extremely good, and in general that of the island is brackish. There is a small fort on *Dungharee-point*, and the town is encompassed with a wall and a ditch, into which water may be admitted at pleasure, by letting in the sea; so that the town is surrounded

with water, and is esteemed one of the strongest places possessed by the company in India. Considering the commodiousness of its harbour, it might have been made our capital place of arms, and been of nearly the same use to the English company as Batavia is to the Dutch, especially if the Portuguese had not unjustly detained from us the large and fertile island of *Salfett*, which would have served as a granary to it; and which they suffered to become an easy conquest to the Marattas, who inhabit the neighbouring coast of the continent.

At proper posts round the island are several little outposts, none of which are capable of making any long defence, except the fort of *Mahim*, which is the most considerable next to that of Bombay, and is situated at the opposite extremity of the island.

The English church at Bombay is able to contain all the English that are ever there. This is a building that has nothing to boast of with respect to its architecture; but is extremely neat, commodious, and airy. It is situated on the *Green*, a spacious area that extends from it to the fort, and is pleasantly laid out in walks planted with trees, and round it are the houses of the English inhabitants.

These have generally only a ground-floor; but they have a court-yard both before and behind, in which are the offices and out-houses. They are substantially built with stone and lime; and being smooth plastered on the out-side, and kept white-washed, they have a neat air; but are offensive to the eyes, from their reflecting the too dazzling rays of the sun. Few of them have glass-windows to any of their apartments, the sashes being generally paned with a kind of transparent oyster-shells, which have the singular property of transmitting sufficient light, while they exclude the violence of its glare, and have a cool look. The flooring is generally composed of a kind of stucco, called *chunam*, made of burnt shells, which, if well tempered, is extremely hard and lasting, and takes so fine a polish that one may see one's face in it.

The houses of the black merchants, as they are called, though some are far from being of so deep a colour as to deserve the name, are generally ill built and inconvenient. The window-lights are small, and the apartments ill distributed. Some, however, make a better appearance by being built a story high; but the best of them have a meanness in the manner and a clumsiness in the execution, that renders them inferior to the buildings of the most ordinary of those of European architecture. Both their and the English houses have small ranges of pillars, that support a penthouse, or shed, either round, or on particular sides, and afford a pleasing shelter from the sun, and at the same time that they keep the inner apartments cool and refreshed, by the draught of air under them. However, most of the best houses are within the walls of the town, which is little more than a mile in compass.

As to the pagodas of the Gentoos, they are scarce worth mentioning, they being low mean buildings, that commonly admit the light only at the door, facing which is placed the principal idol. The Gentoos imagine, that darkness and gloom inspire a kind of religious reverence, and are remarkably fond of having their pagodas among trees, and near a tank or pond, for the sake of their ablutions, which they do not, like the Mahometans, practise as a religious ceremony, but merely out of cleanliness, and the pleasure of bathing in those hot countries. These tanks are frequently expensive works, they being generally square, and encompassed with stone steps. The most remarkable pagoda on the island is on *Malabar hill*, above two miles from the town, and is a promontory that stretches into the sea. From one side of the pagoda is a gentle descent to the sea, and the other three sides are surrounded with trees that form an amphitheatre on the slopes of the hill, affording a most wild and agreeable landscape. These trees being exposed to the winds follow the general law, and take a strong bent to the opposite point with such regularity, that they appear as if trimmed or pruned into the figure they exhibit.

At the extreme point of *Malabar hill* is a rock on the descent to the sea, but at the top, in which is a natural

tural crevice, that has a communication with a hollow that terminates at an opening outwards towards the sea. This is used by the Gentoos as a place for the purification of their sins, which they say is effected by their going in at the opening and emerging out of the crevice.

The king of Portugal, in the year 1663, transferred the property of this island to king Charles II. on his marriage with the Infanta of Portugal, as part of her fortune; and some time after his majesty made a present of it to the English East India company. The island was then, and still continues, divided into three Roman catholic parishes, which are those of Bombay, Mahim, and Salvacem; the churches of which are governed by popish priests, of any nation but the Portuguese, against whom the English wisely objected, from the danger of their carrying on a too close correspondence with the priests of their own nation in the neighbouring Portuguese settlements. Hence most of the proprietors of the land are popish Mestizos and Canarins: the first are a mixed breed of the natives and Portuguese, and the other are aborigines of the country converted to the Portuguese faith. The other land-owners are Moors, Gentoos, and Parsees. All those enjoy the perfect security of their property, and the right of inheritance is regulated according to the respective laws and customs of the people of each religion. The land is chiefly employed in groves of cocoas, rice-fields, and onion-grounds, this island producing an excellent sort.

The company have also acquired a considerable estate in land by purchases, confiscations for crimes, and seizures for debt. They have also two pleasant gardens, cultivated after the European manner: the one a little way out of the gates, open to any of the English gentlemen who please to walk in it; the other, which is much larger and finer, is about five miles from the town, at a place called Parell, where the governor has a very agreeable country-house, which was originally a Romish chapel belonging to the jesuits, but was confiscated about the year 1719, on account of their being guilty of some foul practices against the English interest. This chapel is now converted into a pleasant mansion-house, and, with the additional buildings, is rendered a spacious and commodious habitation. There is an avenue to it of a hedge and trees near a mile long; and, though it is situated not far from the sea, it is sheltered from the air of it by a hill between. The governor spends most part of the time during the heats at this villa, the air being cooler and fresher than in town, and nothing is wanting that can render it an agreeable retreat.

The cocoa-nut groves constitute a considerable part of the landed property. When a number of these are contiguous, they form what is called the woods, through which spaces are left for roads and path-ways, where you are agreeably defended from the sun at all hours in the day. They are also thick set with houses belonging to the respective proprietors, and with the huts of the poorer sort of people; but they are unwholesome for want of a free ventilation.

The government of the island is entirely English, subordinate to the directors of the English East India company, who by commission appoint a president, to whom is joined a council of nine persons; but all of them are seldom on the spot, they being employed as chiefs of the several factories subordinate to the president. Those at Bombay are such as enjoy posts of the greatest trust, as the accomptant, the warehouse keeper, the land-paymaster, the marine-paymaster, and other officers for transacting the company's affairs. These are generally such as have risen by degrees from the station of writers, and take place according to seniority. The president and the members on the spot constitute a regular council, in which every thing is determined by plurality of votes: yet the influence of the president is generally so great, that every thing is carried according to his dictates: for should any of the council oppose him, he can make their situation so uneasy, as to oblige them to quit the service, and return home.

As to the military and marine force, they are more immediately under the direction of the president, who has the title of general, and commander in chief. The

common soldiers are chiefly those whom the company send in their ships; deserters from the several nations settled in India, as Portuguese, Dutch, and French, which last are usually called Reynolds; and lastly, Topasses, who are mostly black, or of a mixed breed from the Portuguese. These are formed into companies, under English officers. In this service may also be included regular companies formed of the natives: these soldiers are called sepoy; they use muskets; but are chiefly armed in the country manner, with sword and target, and wear the Indian dress, the turban, vest, and long drawers.

Nothing has contributed more to render this island populous, than the mildness of the government, and the toleration of all religions, which is so universal, that the Roman catholic churches, the Mahometan mosques, the Gento pagodas, and the worship of the Parsees are all equally tolerated: they have all the free exercise of their religious rites and ceremonies, without either the English interfering, or their clashing with each other. This toleration forms an amiable and a very advantageous contrast to the rigours of the inquisition exercised in the neighbouring territories of the Portuguese, whose unchristian zeal has rendered them odious, and was one of the principal reasons of their being driven out of the greatest part of their conquests there by the Marattas, who are all Gentoos.

S E C T XXXI.

Of the principal Islands near Bombay, particularly Butcher's Island and Elephanta; with a Description of the remarkable Temple in that Island cut in a Rock; and an Account of the Island of Salfett.

THE principal of the small islands near Bombay are Butcher's Island, so called from the cattle being kept there for the use of Bombay and Elephanta. The former is subject to the English, who keep an ensign's guard there, with a very small fort. This island is not above two miles long, and is no where above a mile broad.

The most remarkable of these islands is that of Elephanta, which fronts the fort, and is two miles from Butcher's Island. It does not exceed three miles in compass, and consists of almost one entire hill, at the foot of which, as you land, you see above the shore on the right hand an elephant, coarsely cut in stone, of the natural size, which, at a small distance, may be taken for a living elephant, from the stone being naturally of the colour of that animal. It stands on a platform of stones of the same colour. On the back of this elephant was placed a young one standing, that appears to have been of the same stone, but has been long broken off. No tradition is old enough to give an account of the time or use for which this elephant was formed.

On ascending an easy slope, near half way up the hill, you come to the entrance of a stupendous temple, hewn out of the solid rock. It is an oblong square eighty or ninety feet long, and forty broad. The roof is formed of the rock cut flat; it is about ten feet high, and is supported towards the middle, at an equal distance from the sides, and from one another, by two regular rows of pillars of a singular order. They are very massy and thick in proportion to their height, and have capitals, which bear some resemblance to a round cushion, pressed by the weight of the superincumbent mountain, with which they are also of one piece. At the farther end are three gigantic figures, the face of one of which is, at least, five feet in length, and of a proportionable breadth; but these monuments of antiquity were much disfigured by the blind fury of the Portuguese, when they made themselves masters of the place, and must have taken great pains thus to mutilate and deface them. About two-thirds of the way up this temple are two doors fronting each other, leading into smaller grottos that open upon the hill. By the door-way, on the right hand, are also several mutilated images, single and in groupes, particularly one that has some resemblance to the story of Solomon's dividing the child; a figure stand-

ing with a drawn sword in one hand, and holding an infant in the other, with the head downwards. The door-way on the left hand opens into an area of about twenty feet in length, and twelve in breadth; at the upper end of which, on the right hand, is a colonade, covered at the top. It is ten or twelve feet deep, and in length answers to the breadth of the area: this joins to an apartment adorned with regular architecture; it is an oblong square, and has a door in perfect symmetry. The whole is executed in a taste very different from any of the oldest and the best Gentoo buildings any where extant. It is remarkable that round the cornices are some paintings, the colours of which remain exceeding bright and fresh, though, supposing they are as old as the temple, they must have been there some thousand years. The time when this great work was performed is entirely unknown. The most probable conjecture is, that it was formed by the aborigines of the country, and that the religion of the Gentoos has undergone some revolution; which is the more probable, as the present Gentoos do not appear to retain any veneration for the place, except on account of its undoubted antiquity.

The situation of this place so near Bombay, not only affords the English inhabitants an easy opportunity of gratifying their curiosity in visiting so remarkable a piece of antiquity, but occasionally of a very agreeable party of pleasure. In their way thither they sometimes dine at Butcher's Island, on account of the convenience of the officer's house to receive them. But others, taking their provisions with them, dine in the cave itself, for, during the sultry heats, there cannot be imagined a cooler and more pleasant retreat; for though the air abroad is excessive hot, you no sooner enter the cave than you are refreshed with a sensible coolness, the three openings not only furnishing sufficient light, but a thorough draught of air, that does not so properly convey freshness into the cave as receive it from its constant temperature, which is preserved by its being impenetrable to the sun from the thickness of the mountainous mass above it; for it is observed in India, and other hot countries, that the exclusion of light is also the exclusion of heat; and that by only darkening an apartment, it is sensibly cooled. This admits of no exception, but where the soil and situation are of such a nature as to continue the heat after the actual presence of the sun is withdrawn.

This island contains nothing more that is worthy of notice; for there are not above two or three huts upon it, and it has no water but what is saved from the rains. The growth of the hill is only underwood and grass, which in the dry season are often set on fire, and will continue burning for three or four days.

To the northward of Bombay is the fertile island of Salfett, which in one place is only divided from it by a narrow pass, fordable at low water. It is about twenty-six miles in length, and, on a medium, eight or nine in breadth. The soil is very rich, and capable of being improved by cultivation, so as to bear every thing produced between the tropics. It is well watered, and was employed by the Portuguese chiefly to raise rice, with which it used to furnish Goa, whence it was called its granary. It has also great plenty of almost every species of game, both of the fur and feather kind, and it is not easy to conceive a more agreeable spot in the universe. It was formerly comprehended under the regality of Bombay, and was consequently comprehended in the treaty of cession made of that island to England; but we were afterwards defrauded of it by the Portuguese, though it is so essentially necessary to Bombay, that the numerous inhabitants of the last mentioned island, cannot well subsist without supplies of all manner of provisions from thence.

But while this island remained in the hands of the Portuguese, it was at least some alleviation of the damage we sustained in losing it, that it formed a barrier for us against the invasions of the Marattas. But such was the supine indolence and blindness of the Portuguese government to its own interest, that no care was taken to defend it from these their constant and natural enemies, who had not then the least maritime force. As the island could only be attacked by land at one

narrow pass, fordable only at low water, the Portuguese had only a miserable redoubt of no strength; but at length the appearance of an approaching rupture induced them absurdly to begin the construction of a fort, without providing any means of covering the buildings. The Marattas let them go quietly on, that they might build it for them, and, when it was near finished, poured their troops into the island, and easily took the fort, before any of the batteries were mounted with cannon, and thus the whole island fell as easy a prey to them as they could wish; by which means Bombay is now become a frontier open to their incursions, and they are always able to distress that settlement, by refusing them supplies of provisions.

But to return to the island itself. It has nothing remarkable in it, besides the riches of nature, except the ruins of a place called Canara, where there are several caves in the rocks, supposed to be cotemporary with that of Elephanta, but none of them approach near it, either in point of size or workmanship. The mountains are pretty high, and there is a tradition, that they, together with the rest of the island, were raised from the sea by a violent earthquake; in confirmation of which it is pretended, that not many years ago, one of the stone anchors, antiently used in the vessels of that country, was found on the top of the highest hill; but it does not appear that there is sufficient foundation for this story.

S E C T. XXXII.

A particular Account of an Indian Nation, called the Marattas, who inhabit the Country near Bombay.

HAVING treated of the island, we shall now add some account of the continent bordering upon Bombay. It is inhabited by the Marattas, a powerful tribe of Indian Gentoos subject to the mar-rajah, or arch-rajah, who is their king or chief. They are generally a clean limbed, straight people: their complexions are of all shades from black to light brown, and they are observed to be fairer in proportion to their distance from the sea. Their features are generally regular, and even delicate. They shave their heads, only preserving in the middle a lock, which grows to its full length, so as to tie and hang down behind, and two curls, one on each side, just above the ears. Their women are for the most part very handsome, while the bloom of life continues; but that soon fades, for few preserve the charms of their shape and skin till they are thirty.

The common people wear round their heads a small turban of coarse mullin, or a small piece of cloth or calicoe; they have also a short piece of cloth about their waists, and a loose mantle, which they throw over their shoulders, and when they take their rest, spread it on the ground. They are equally bred to agriculture and arms; but the pay of those in actual service is extremely small, and not furnished in money, but in rice, tobacco, salt, pieces of cloth, and in the other necessaries and conveniences of life. They have extended their dominions by the sword, and as they encourage Europeans to desert to them, have learned the art of war, and can form regular sieges, but are most fit for sudden excursions.

Their horses, on which they principally rely, are small, but hardy, inured to fatigue, and sure footed. Many of the men have musquets; but they are very indifferent ones, and most of them match-locks: but their chief dependance is on their swords and targets; the former are of an admirable temper, and the men, who are well trained in the exercise of them, look with great contempt on those brought by our ships from Europe. Their targets are perfectly round, and rise in the middle almost to a point; they are hard, smooth, light, and well varnished; they will therefore easily turn a pistol ball, and at some distance the ball of a musquet. They have likewise among them excellent archers and slingers.

Their

Their food is extremely portable, a little rice, and a leathern flask for water, is all they require, so that every soldier carries his own allowance: the officers themselves have no better diet, especially during their expeditions, which are conducted with great address and amazing rapidity.

The people affect the appearance of the utmost poverty in their dress and houses, to avoid becoming a prey to their rapacious government, which never spares a subject known to be rich, for though they are sometimes left to amass wealth in quiet, this is only considered as so much in bank, to be seized whenever the government pleases to call for it. No distinction is here made with respect to the rank and office of the persons plundered, except of the great military officers, who are made the instruments of oppression, and whom it is unsafe to disoblige. This has occasioned immense treasures to be buried.

The mar-rajah usually keeps his court, or more properly head military quarters, at the fort of Karee in the mountains of Decan, said to be the most impregnable place in the world, it being fortified with a mound of very high rocks so steep, as to be only accessible by one narrow path; and has this advantage, that the land thus inclosed is sufficient to produce grain enough for the maintenance of the garrison; and besides, great quantities of corn are constantly kept in the magazines there. A small number of men is sufficient to defend this natural fortress against the greatest armies that can be brought against it, as all the passes and defiles leading to it thro' the mountains, are extremely narrow and rugged.

Here the mar-rajah usually resides with a kind of military court, composed of his generals and officers, in all the state of a sovereign prince; but both he and his courtiers are so entirely engrossed by military operations, that they are extremely incurious with respect to the arts, manufactures, and rarities of the Europeans. It would be in vain to shew them any of those exquisite pieces of workmanship, which are produced by our artists; they would indeed out of civility praise them with an air of careless indifference; but have so little taste, that tho' no people are fonder of adorning their women with rich jewels, yet they would prefer those of their own workmen comparatively coarse and clumsy setting, to those of our greatest artists.

These people, from time immemorial, have had settlements to the north of Delli, great part of which they still possess, though such numbers were driven from thence by Aurengzebe, that he employed above twenty years to reduce them in their new settlements in the mountainous parts of the Decan. Ever since they have carried on continual wars with the Moguls, subahs and nabobs, and have made innumerable treaties of peace, which they only observe while it suits their interest.

Those who have had a share in the late wars of India, were only a body of horse, who may be termed freebooters, that alternately take the pay of the highest bidder, but render themselves formidable to the Moors, who marching such numerous and incumbered armies into the field, are by them perpetually harassed, and reduced by famine; for continually galloping round the country, they cut off the convoys, and as they have no baggage, easily elude all pursuit; and if pursued by superior numbers instantly retire to their fastnesses in the mountains. They have principally enriched themselves by obliging their more wealthy neighbours to become tributary to them; who submit to this from the consideration, that it is less expensive, and a lighter tax upon trade, to agree to some certain payment, than to engage in the unknown expence of armies, to free themselves from so irregular a foe.

In short, these people are destructive enemies, and unserviceable friends. They ruin their enemies by plundering and burning the country, and their allies by their avaricious demands for money. Instead of meriting their pay, which they might easily do after a defeat, by cutting off all the broken troops, they fly to the camp, where every man procures a good burthen for his horse, and walking on foot, drives him away loaded with spoil.

S E C T. XXXIII.

Of Angria the Pirate, with an Account of the Conquest of his Dominions by the English.

AS the fame of Angria has spread all over Europe, and as he has given great disturbance to all the nations who have traded to India, it is proper that some account should be given of so formidable an enemy, that the English reader may see by what means a small nest of pirates established a little empire, and how the dominions acquired by those pests of society were conquered by the bravery of our troops.

About a hundred years ago Conojee Angria, from being a private Maratta, rose to be general and admiral under the Saba Raja in his wars with the admiral of the Mogul; and being afterwards made governor of a small, rocky, well fortified island, named Severndroog, seized many of the vessels he had formerly commanded, and with these began to commit acts of piracy, but confined himself to this island till, by repeated successes, he became more formidable. The Marattas were alarmed; but as he had taken most of their fleet, they were unable to attack him in his island, and therefore erected three forts upon the main, within less than point-blank shot of his little territory, which was only about a mile in circumference. They flattered themselves that, by means of these forts, they should reduce him to obedience; but he being superior to his countrymen in skill and bravery, attacked and took several of their sea-ports, and at length extended his conquest on the sea-coast near sixty leagues in length, in which space were several commodious harbours. He also in some places extended his conquest twenty miles, and in others thirty, into the country, and secured his conquests by building small forts that commanded all the narrow passes.

His successors increased their strength by entertaining every desperate fellow they could seduce from the European settlements, and became so powerful, that the Marattas agreed to conclude a peace with them, on condition of their acknowledging the sovereignty of the Raja, and paying him an annual tribute. They now made very considerable captures, and not only took several India ships richly laden from the English, French, and Dutch, but had the presumption to attack commodore Lisle in the *Vigilant*, of sixty-four guns, the *Ruby*, of fifty guns, and several other ships in company; and the Dutch suffered so much, that about twenty years ago, they sent seven armed ships from Batavia, and two bomb-vessels, with a number of land-forces, and attacked Geriah, but without success.

Angria now threw off his allegiance to the Marattas; upon which their chief sent ambassadors to remonstrate with him; but he was so far from regarding them, that he ordered the ears and noses of these ambassadors to be cut off. The Marattas, exasperated at this insult, meditated his ruin, and made repeated application to the governor and council at Bombay to assist them with their ships.

The piracies of Angria's successors, who being of his family, bore his name, still greatly annoyed not only the natives both by sea and land, but all European and Moorish ships, and our East India company was at the constant expence of a marine force at Bombay to protect their trade; they therefore made some attempts to destroy these pirates, but without success, till the year 1755, when commodore James, commander in chief of the company's marine force in India, sailed from Bombay in the *Protector*, of forty-four guns, with the *Swallow*, of sixteen guns, and *Viper* and *Triumphant* bomb-vessels, and attacked the fortresses of Severndroog.

This fortress is situated on an island within musquet-shot of the main-land, and is strongly, but not regularly fortified; the greatest part of the works being cut out of the solid rock, and the rest built with stones ten or twelve feet square, and on the bastions were fifty-four guns. The largest of the forts on the main-land, called Fort Goa, is built in the same manner, with large square stones, and mounted with forty guns. Two other forts,

in which were mounted above twenty guns each, were formed with less art, of stones of an irregular shape.

The commodore began to cannonade and bombard the Island Fort on the second of April; but finding the walls on the side where he began his attack of extraordinary strength, for they were fifty feet high and eighteen thick, he changed his station, so as to reach Fort Goa with his lower-deck guns, while he plied Severndroog with his upper tier. About noon the north-east bastion of the latter and part of the parapet were laid in ruins, when a shell set fire to the houses, which the garrison were hindered from extinguishing by the incessant fire from the round tops. The wind being northerly the flame spread almost all over the fort; one of their magazines blew up, and a general conflagration ensued. A multitude of men, women, and children running out on the farther side of the island, embarked in boats; but most of them were taken by the Swallow, who was stationed to the southward, to prevent any succours being thrown into the island on that side.

The commodore then directed all his fire against Fort Goa, and, after a severe cannonade, the enemy hung out a flag of truce; but the governor, with some chosen sepoys, crossed over to Severndroog, which was still tenable; but, upon the blowing up of their second, and grand magazine, the houses there were entirely evacuated.

The governor was now in possession of the Island Fort, and the commodore of the other three, from whence he kept a smart fire on Severndroog; but the governor, trusting to the natural strength of the place, resolved to maintain it till he should receive succours from Dabul. A number of seamen were therefore landed under cover of the fire from the ships and the shore, who bravely ran up, and with their axes cut open the gates of the Sally-port, and, with little loss, procured an entrance.

On the eighth of April, the commodore anchored off Bancote, now named Fort Victoria, the most northern port of any consequence in all Angria's dominions, which surrendered the next day. This place the East India company, with the free consent of the Marattas, have taken into their hands, for it has a good harbour, and a considerable trade for salt and other goods; and besides, the country abounds with cattle, which are much wanted for the use of the garrison and squadron at Bombay. As all other places were by treaty to be delivered up to the Marattas, the commodore struck the English flag, and gave them up to that people.

In November following the squadron under the command of rear-admiral Watson arrived at Bombay, and on the eleventh of February the admiral and the whole squadron, with the ships under the command of commodore James, and some of the company's armed ships, appeared before Geriah, the capital of Angria's dominions. That pirate, terrified at seeing so large a force upon the coast, abandoned his fort, in hopes of purchasing a peace with the Marattas; who, knowing how to make their advantage of his present situation and perturbation of mind, turned their thoughts on the riches of their prisoner, for such they considered him; and, in order to obtain the plunder of the place, insisted on his sending orders to his brother, who commanded in the fort, to put them in possession of it.

The admiral, being informed of these clandestine proceedings, sent a summons to the fort the next morning, and receiving no answer, stood into the harbour in two divisions. The Bridgewater leading his majesty's ships, was followed by the Tyger, Kent, Cumberland, and Salisbury, with the Protector, of forty guns, belonging to the East India Company. The King's-fisher led those of the company, which were the Revenge, Bombay, Grab, and Guardian frigates; with the Drake, Warren, Triumphant, and Viper bomb-ketches. The ships soon began such a fire as silenced both the batteries and the grabs. About four o'clock a shell was thrown into the Restoration, an armed ship taken by Angria from the company, which set her on fire; and soon after his whole fleet was in a flame.

In the night the admiral landed all the troops under the command of colonel Clive, and the next morning

sent to let the commandant know, that if he did not deliver up the place to the English in an hour's time, the attack should be renewed, and he must expect no quarter. In return, he desired a cessation till the next morning, as he could not deliver up the place without Angria's permission. This being thought a trifling pretence to gain time for giving the Marattas the possession of the place, the admiral renewed the attack about four in the afternoon, and in less than half an hour the garrison hung out a flag of truce. It was then expected they would haul down their colours, and admit our troops: but this demand not being complied with, the attack was repeated with so terrible a fire, that the garrison cried out for mercy, which our troops could hear distinctly; and soon after they took possession of the fort.

Colonel Clive had blockaded the fort on shore, and prevented the Marattas getting possession of the place in a clandestine manner. This evidently appeared to be their design, since they offered the captains Buchanan and Forbes fifty thousand rupees to suffer them to pass their guard; but they, rejecting the offer with indignation, disclosed it to colonel Clive, and then the Marattas found it as impossible to elude the vigilance of the commander, as to corrupt the integrity of his officers.

The loss on both sides was very inconsiderable; our people found their safety in their own bravery and spirit, and by driving the enemy from their works with the briskness of their fire. The garrison had no sooner abandoned the batteries than they were sheltered by the height and thickness of their walls; for all their ramparts which were not hewn out of the solid rock were built of massy stones, at least ten feet in length, laid end-ways; so that the greatest weight of metal could never have made a breach. It is therefore evident, that the garrison was subdued merely by the terror of so unusual a fire. The English found in the place above two hundred guns, six brass mortars, a large quantity of ammunition, and above one hundred and twenty thousand pounds in money and effects.

S E C T. XXXIV.

Of the City of Visapour, or Visapore; and a particular Description of Goa, the Capital of the Portuguese Settlements in India.

VISIAPOUR is the capital of a kingdom of the same name, to the east of the territory conquered from Angria. It is situated in seventeen degrees forty minutes north latitude, on the banks of the river Mendeva: the city is very large and surrounded with high walls, and authors represent it as being defended by a thousand pieces of cannon. Without the walls, which are two leagues in circumference, are five spacious suburbs, which render the whole circuit five leagues. The king's palace is in the middle of the town, from which it is separated by a double ditch, and is three miles in circumference. The houses are only built of straw and reeds, and the doors so small that one must stoop to enter them. This kingdom is tributary to the Great Mogul, and the people can hardly acquire by continual labour sufficient to pay the different subsidies with which they are oppressed, under pretence of the tribute that must annually be sent to Delli. The inhabitants are some of them goldsmiths, others work in brass, wood, cotton, or silk, which they send abroad to foreigners, or sell to those who come thither to buy them. Others trade in diamonds, pearls, or lace; and, though they sell their goods dear, few acquire a fortune. The plenty of pepper renders it cheap, and the Dutch get considerable quantities from this city, and the neighbouring country.

On returning back to the coast we come to Goa, which formerly belonged to the same kingdom, and is the first place of consequence to the south of the dominions lately in the possession of Angria.

Goa, the metropolis of the Portuguese dominions in India, is situated in an island about twelve miles long and six broad, in fifteen degrees twenty minutes north latitude,

latitude, and in seventy-three degrees twenty minutes east longitude from London. This island is encompassed by a salt water river, which falls into the ocean with two mouths a few leagues below the town, where it forms a very commodious harbour capable of receiving ships of the largest size, which lie within a mile of the city. The shore of the island next the river is adorned with noble structures, as churches, castles, and gentlemen's houses.

The houses of the city are large, and their out-sides magnificent, they being all built of stone, but are poorly furnished within; and their streets are cleaner than the tops of their houses, where they do all their occasions. The city contains a large, neat, and rich cathedral, with twenty-seven churches and convents, a very fine hospital well endowed and richly adorned, the house of the inquisition, and other public buildings.

St. Roch's monastery is a magnificent structure, that has a library, an hospital, and an apothecary's shop well furnished. The Dominicans have a very large college, which is a pleasant magnificent fabric, that has a noble front towards the street: their church is rich in ornaments and plate; its pillars are gilt, and the martyrology of their order is painted on the walls. The Franciscans have a small church, which is one of the finest in the city, there being so much gold about the high altar, and in the eight chapels on the sides, that it resembles an entire mass of that metal. There is a fine church here dedicated to St. Paul, in which lies the body of St. Francis Xavier, the Portuguese apostle of the Indies. It is visited by numbers of people with great veneration, who leave something at his shrine to pay for the candles and olive-oil that continually burn before it; but none are permitted to have the honour of entering within the iron rails that guard the tomb. It is richly adorned, and the late duke of Tuscany sent a magnificent pedestal of green jasper, embellished with a brass plate, on which the most signal actions of St. Xavier are finely represented. The Jesuits expose his relics on the anniversary-eve of his festival.

Of all the churches in and about Goa none have glass-windows, except one in the city dedicated to St. Alexander; the rest have panes of transparent oyster-shells, as have likewise all their most stately houses. Every church has a set of bells, and some of them are continually ringing.

The viceroy usually resides at the powder-house, two miles below the city, where are springs of the best water in the island. He has, however, a very noble palace over one of the city gates, which leads to a spacious street half a mile in length, containing rich shops of silk, porcelain, drugs, and other valuable commodities, and is terminated by a beautiful church called *Misericordia*. In this palace is a long gallery, which contains the pictures of the former viceroys, and has a chair of state at each end. He has another seat which he frequents in the summer, at a place called *Pengeim*, which is a mile from the bar.

The market-place, which stands near the church of *Misericordia*, is about an acre square, and in it are sold most things produced in that country. In the shops about it may be had not only the produce of Bengal, but of Europe, China, and other countries. Slaves, cattle, and several articles of provisions, are sold in the market by auction; but they leave off early on account of the excessive heat of noon.

The established religion is that of Rome, the professors of which are the most zealous bigots in the world. The court of inquisition proceeds with the greatest severity against all whom the merciless inquisitors suspect of being guilty of heresy. The victims of their cruelty, instead of being Jews, of which there are not a sufficient number, have been mostly taken out of the body of the Indian Christians; for its familiars or emissaries have their eyes particularly on the converts, or their descendants, especially if any of them are become rich, and will afford a handsome confiscation to that holy tribunal: but though the severity of the inquisition strikes an awe both into the clergy and laity, many Gentoos are suffered to dwell in the city, where they are tolerated on account of their being more industrious than the

Portuguese Christians; but the mercantile part of them are very liable to be insulted; for it is even dangerous for them to refuse letting the Portuguese have their goods, or to ask for their money when it is due, for fear of the *baitnado*, and sometimes worse consequences. This necessarily renders the circulation of trade very inconsiderable.

The clergy of Goa are extremely numerous and illiterate. Captain Hamilton says he stood on a little hill near the city, and counted near eighty churches, convents, and monasteries within his view; and he was informed, that in the city and in its districts, which extend twenty miles along the coast of the continent, and fifteen miles within land, there are at least thirty thousand monks and churchmen, who live idly and luxuriously on the labour of the miserable laity, for here the tyranny and oppression of the domineering clergy are insupportable.

The first, or grand inquisitor, is always a secular priest, who pretends to have the sole privilege of being carried in a palanquin, and is treated with much greater respect than even the archbishop, or the viceroys. His authority extends over all persons, both ecclesiastics and laymen, except the archbishop, his grand vicar, who is always a bishop, the viceroy, and the governors who represent him; but he may cause even these to be arrested, and begin their process, after he has informed the court of Portugal of the crimes laid to their charge. His palace, as well as that of the viceroy, is very magnificent: his household consists of gentlemen, equerries, pages, footmen, and a multitude of other domestics. The second inquisitor is a Dominican, and the other officers, called deputies of the holy office, are taken from among the Dominicans, Augustines, and bareheaded Carmelites.

To return to the city: some represent the walls that encompass it as twelve miles round, including within this space several fields and gardens. Within a musquet shot of the bar is the Black Fort, and about a mile within it is a battery built close to the sea, on a small promontory, called *Nos Senhor de Cabo*, and opposite to it, on a little hill, which commands that side of the river, is another fort. Without that is the *Aguada*, with a fort on the top of it, and several batteries at the foot of the high grounds. In the castle is a large lanthorn for a light-house to direct shipping into the road, when about the beginning of September, the land is obscured by thick clouds. The harbour, in short, is so well defended by forts and large batteries, that it is the strongest in India.

The island produces little corn, but has some excellent fruits, and the mangoes, in particular, are said to be the largest, and most delicious of any in the world.

The most singular vegetable in the island is called the sorrowful tree, because it flourishes only in the night. At sun-set no flowers are to be seen, and yet half an hour after it is quite full of them. They yield a sweet smell, but the sun no sooner begins to shine upon them, than some of them fall off, and others close up; and thus it continues flowering in the night during the whole year. It is nearly as large as the prune-tree, and its leaves resemble those of the orange. The people commonly plant them in the courts of their houses, in order to have the advantage of their shade and smell.

The Portuguese of this city are said to be idle, lustful, and so generally tainted with the venereal disease, that it is thought no disgrace.

The chief inhabitants of the island are always attended by slaves holding umbrellas to shade them from the sun. The women load themselves with jewels, and rosaries of gold and silver, bracelets of gold, pearl necklaces, lockets, and pendants of diamonds. Their shifts reach only to their waists, over which they wear a close jacket, and a petticoat. They have very rich slippers, but wear no stockings. Their shape and features are agreeable, but their close confinement, when ever they are suffered to appear, gives them a very stiff and bathful air. Their chief diversion is singing, and playing on the lute, and their principal business is making confessions, pickles, soups, ragouts, olios, and other dishes, in which they are very expert. But they seldom

fit at table when a stranger dines with their husbands. As to their children, they are suffered to run about naked till they are ashamed of it themselves.

All butcher's meat is prohibited, except pork, on account of the leanness of their cattle, which, when killed, the flesh resembles carrion. Green fruit and roots in their proper seasons, with a little bread and rice, are the principal parts of their diet; but in all seasons they regale themselves with candied and preserved fruits; their bread is extremely fine. They have great plenty of hogs and fowl, and some pigeons; but the clergy feed mostly on fish, which are scarce, though the seas so near, and none must presume to buy them, till they are first served, so that what comes to the share of the laity is generally stale. All the wine drank here is brought from Portugal, except that of the palm, which, together with water, are the only liquors drank in the country, except arrack. The soldiers, fishermen, peasants, and handicraftsmen feed on a little rice boiled in water, with a small quantity of salt-fish, or pickled fruits, and are glad of fair water. The laity are generally lean and feeble; and it is said to be very uncommon to see a fat man who does not belong to the church.

S E C T. XXXV.

Of the Port of Carwar, the Kingdom of Bisnagar, the Province of Canara, with the Ports of Onzar, Batacala, Barabur, Mangalur, Cananor, and Tellicherry.

THIRTY-SIX miles to the south of Goa is Carwar, where the English have a factory, and a small fort, with two bastions and some cannon. The factory is situated on the south side of a bay, that has a river capable of receiving ships of three hundred tons burthen, and is opposite a pleasant island, well stocked with game. There are in this factory a chief and council to manage the company's trade.

The vallies around the town abound with corn and pepper, which is by some esteemed the best in the Indies. In the woods on the mountains are tygers, wolves, monkeys, wild hogs, deer, elks, and a species of beeves of a surprising size. A late author observes, that one of these being killed, the four quarters weighed above a ton, besides the head, hide, and guts. The horns were at the roots twenty three inches in circumference, and the marrow-bones so large, that the marrow was taken out with a silver table-spoon; but the flesh was inferior to common beef. In the woods are three kinds of tigers; the smallest and the most fierce does not exceed two feet high, the second is about three feet in height, and hunts wild hogs, deer, and a little creature called a pissay, which is of the shape of a deer, and has the head of a hog, with two long tusks, like those of a wild boar, growing upwards, and two others which grow downwards from the upper jaw, reaching to the under part of the lower jaw. This creature is harmless and timorous: it is of the size of a cat, and feeds on grass. The third species of tigers is about three feet and a half high, but seldom attacks mankind.

The woods also abound with wild peacocks, and other birds, among which are a species of the size of a pigeon, called bill-birds, on account of the largeness of their bills, which are of several forms and colours, and make excellent powder-flasks.

Mr. Hamilton informs us, that he was once here in the woods with his fuzee, when a small rain falling, happened to damp his powder, which was only wrapped in paper. His gun being thus rendered useless, he struck into a foot path, that led from the mountain to the factory; but before he had gone far he espied a very large tiger in the same path, with his face towards him. The tiger, on seeing him, squatted with his belly to the ground, and wagging his tail, crawled slowly to meet him. Our author thinking it in vain to fly, walked leisurely forward, till coming within ten yards of him, he clubbed his piece, and made all the noise he could to frighten him, on which the beast rushed into a thicket, and leaving the path free, Mr. Hamilton escaped with no other harm than being greatly terrified.

As the chief of the English factory is usually much esteemed, he seldom goes a hunting without being accompanied by most of the people of distinction in the neighbourhood, attended by their servants well armed, and with hautboys, trumpets, and drums. The men with fire-arms place themselves at convenient distances along the skirts of a hill or wood, while others being sent with loud music to rouse the game, spread themselves for a mile or two, and, on a signal given, strike up at once, and march towards the place where the musqueteers attend; when the wild inhabitants of the woods, astonished at the unusual noise, fly before the music, and fall into the ambuscade, where many of them are killed.

About two hundred miles to the east of Carwar, and in thirteen degrees twenty minutes north latitude, is the city of Bisnagar, which is also called Narasing, and Chandagiri. This city, which is the capital of Bisnagar, is built on the summit of a high mountain, and encompassed with three walls, the outermost of which is said to be above nine miles round. The palace of the prince is lofty, spacious, and surrounded with large and deep ditches. None are suffered to enter the fortress without his express permission. He allows Europeans, and other strangers, to pass some days in the city in the quality of travellers; but none are permitted to settle there for the sake of trade. However, many have staid there long enough to inform us, that there is no place in the Indies, where justice is so impartially administered.

The king of Bisnagar calls himself king of kings, and husband of a thousand wives; and has sometimes made war to maintain these ridiculous titles. He has several fortified towns, but his cannon are said to be only formed of thick plates of iron, firmly joined together, and strengthened like butts, with iron hoops. Every year he visits his kingdom, and reviews his troops, which are said to amount to thirty thousand cavalry, seven hundred elephants, and one hundred thousand infantry. He has several other cities, the principal of which are Rasconde, where is one of the richest diamond mines in the Indies; Bezouar and Gandecot, famous for the number and singularity of the pagodas, and several other places, whose fields produce rhubarb, ginger, pepper, cocoa-nuts, palm-trees, and rice.

Still farther to the south is the province of Canara. Its most northerly part is Onoar, which has a river of such depth as to admit ships of two or three hundred tons burthen. Here is an ancient castle, built by the Portuguese, when they were lords of the coast of India; but the natives blocked them up in the castle, till hunger forced them to surrender.

This is said to be the country in which the custom of the widows burning themselves on the funeral-pile of their husbands was first introduced, and where it is still practised; but the manner in which it is performed we have already described in Sect. XI. page 192.

The country of Canara is usually governed by a female, who keeps her court at a town called Baydour, two days journey from the sea. She may marry whom she pleases, but her husband never obtains the title of raja, though it is bestowed on her eldest son; but, while she lives, neither her husband nor her sons have any thing to do with the affairs of government; nor is she under any obligation to burn herself when her husband dies.

The people here pay such obedience to the laws of justice and humanity, that robbery and murder are hardly ever heard of among them, and a stranger may pass through the country with the utmost safety. However, no man is permitted to ride either on an elephant, a horse, or a mule, except the officers of state and soldiers; but others are allowed to ride on buffaloes and oxen; nor are any permitted to have umbrellas carried over them by their servants; but if they are incommoded by the sun, or the rain, they themselves must carry them; but in every other respect their liberty is not restrained.

The next port to the southward of Onoar is Batacala, where are the remains of a large city that stands on a small river about four miles from the sea. The country produces a considerable quantity of pepper, and the Eng-
lish

View of the Harbor

W. H. W. Sculp.

lish company had formerly a factory there; but about the year 1670 an English ship which came to trade there having a fine English bull-dog, the chief of the factory begged him of the captain. Soon after the ship had sailed, the factory, which consisted of eighteen persons, going a hunting, unfortunately took the bull-dog with them, and passing through the town, the dog seized a cow and killed her. The priests, greatly enraged at this profanation, incited the mob to revenge the sacred animal, which they did by murdering the whole factory; but some of the natives, who were friends to the English, dug a large grave and buried them all in it. Afterwards the chief of the English factory caused a stone to be placed over the grave, on which was this inscription. "This is the burial-place of John Best, and seventeen other Englishmen, who were sacrificed to the fury of a mad priesthood and an enraged mob." After this the English never settled there, though they frequently go thither to buy pepper.

The next town to the southward is Barcelor, which is situated on the banks of a broad river about four miles from the sea, and a hundred and thirty miles south of Goa. The English, Dutch, and Danes have factories here; and here the Portuguese obtain supplies of rice, and, in return, sell the inhabitants horses, dates, pearls, and other merchandize of the produce of Arabia.

The next sea-port town towards the south is Mangalor, which is one of the most considerable places in the kingdom, and is situated in thirteen degrees north latitude. It has an excellent road for ships to anchor in while the rainy season lasts, and carries on a considerable trade. The town is seated on a rising ground, and is inhabited by Mahometans and Gentoos, but it is poorly built, and only defended by two small forts. The Portuguese have a factory here, and a pretty large church, frequented by the Indian converts; but both the priests and the laity are very debauched. The plains annually bear two crops of corn, and the higher grounds produce sandal-wood, betel, and pepper.

Cananor is a large maritime town in a kingdom of the same name, and is situated in twelve degrees north latitude: it has a very large and safe harbour. The Dutch have a fort here of considerable extent, and at the bottom of the bay is a town independent of the Dutch, whose prince can bring twenty thousand men into the field. This place formerly belonged to the Portuguese, who had a strong fort; but in 1660 the Dutch took it, and having added a large curtain, with two royal bastions, demolished the Portuguese town.

Tellicherry is situated farther to the south, and here the English East India company have a factory pretty well fortified with stone walls and cannon. The town is situated at the back of the fort, and is also encompassed with a stone wall. The established religion is that of the Gentoos; but there are a few black Christians who live under the protection of the factory, and some of them serve for soldiers in the garrison.

S E C T. XXXVI.

A Description of the remaining part of the Peninsula of India, particularly the Kingdom and City of Calicut. A remarkable Method of making War in the Dominions of the Raja of Sarimpattam. Of the City of Cranganor; with a particular Account of Cochín, the Capital of the Dutch Settlements on the Coast of Malabar; and of the Jews settled there. Of Anjengo, and some remarkable Circumstances relating to the Queen of Attinga, and the Government of that State.

CALICUT is the capital of a considerable kingdom to the south of Tellicherry, and is situated in eleven degrees twenty-one minutes. Its sovereign bears the title of Zamorin, or Samorin, which signifies emperor, and is the most powerful of all the Malabar princes; for some say he is able to bring an hundred thousand men into the field. The country abounds in pepper, coroa-trees, sandal-wood, iron-wood, and timber for building: it also produces cotton and precious stones. This country is famous for producing the cotton-cloth, which from

the name of this country is called callicoe, of which immense quantities have been exported from thence to almost all parts of the world. There are also here monkies of an extraordinary size, which jump from tree to tree with surprising agility.

Some authors say, when the Samorin marries he must not cohabit with his bride till the namboury, or chief priest, has enjoyed her, for which that priest receives five hundred crowns; and, if he pleases, he may have her company for three nights, because the first-fruits of her nuptials must be an holy oblation to the God she worships. The naires, or nobles, who marry a maid, also pay the clergy for doing them the same favour. Here the daughters of the naires are allowed to marry a number of husbands; but of this custom we have already given a particular account in Sect. XI.

The city of Calicut is said to be three leagues in circuit; but is not encompassed by a wall. It is supposed to contain six thousand houses, most of which are placed at a sufficient distance from one another to allow each a garden. A merchant may here purchase a house for twenty crowns, and those of the common people seldom cost more than two; they are indeed only built of very large bricks dried in the sun, and do not exceed seven or eight feet in height.

This was the first place at which the Portuguese landed in 1498, when they first discovered India, by doubling the Cape of Good Hope. In 1714 the Samorin quarreling with the Dutch, they carried on the war, till they obliged him to consent to allow them seven per cent on all the pepper exported out of his country for ever. This war was a great loss to the chief of the English factory at Calicut, who had annually sold five hundred or a thousand chests of opium into the inland countries; but by the agreement made at the peace, that trade also fell into the hands of the Dutch. The English, however, still export from this place what pepper and Indian goods they can procure. The French have an inconsiderable factory here.

The princes and chiefs of the Malabar dominions, and particularly the Samorin of Calicut, on extraordinary occasions, make entertainments, to which the whole country is invited; but the expence rather arises from the quantity than the quality of the provisions, which chiefly consist of rice, the grain called dhoil, with the sauce of turmeric, cocoa-nut, and other vegetables, all which are exceeding cheap; and their only liquor is pure water. These entertainments are literally cramming matches: for it is not unusual for some of the guests, tempted by this food being at free-cost, to over-charge their stomachs, so as to die under it. This, says Mr. Grose, is treated as a matter of pleasantry; and when they would celebrate the magnificence of one of these feasts, they do it by telling the number that burst at it.

On the back of the Samorin's dominions, and contiguous to them, is the country of the raja of Sarimpattam, which is said to have been never yet subdued. It has been a constantly received law with these humane and equitable people, never to make any but a defensive war, and even then not to kill a man though in battle; instead of which they practise a singular method of fighting, which is attended with success. Their warriors are trained up to a particular dexterity of cutting off the noses of their enemies in an engagement; and the dread of incurring this deformity has proved sufficient to keep neighbours not more martial than themselves from disturbing their tranquillity. This, as the above ingenious author observes, reminds us of the celebrated stratagem of Julius Cæsar, at the battle of Pharsalia, who, riding round the ranks of his hardy veterans, directed them to aim at the faces of the young delicate patricians.

Still farther to the south is Cranganor, which was possessed and fortified by the Portuguese soon after their arrival in India; but the Dutch took it from them in January 1662. The Dutch found here several magnificent edifices built by the Portuguese, particularly a noble college of jesuits, with a stately library belonging to it; and, as this place was a bishop's see, it had a cathedral, and six or seven other churches, of which the ruins only

remain. Without the walls was also the college of Channote, famous for the resort of the Christians of St. Thomas, who performed the offices of their religion in the Syriac tongue, and had a Syriac school for the instruction of youth.

Fourteen or fifteen miles farther to the south is the city of Cochin, which is situated in a kingdom of the same name, in ten degrees north latitude. There are two towns of this name, called Old and New Cochin; the former is situated up a river half a league from the sea; and, as the sea has gained upon the land, the other is not now above a hundred paces from the shore.

New Cochin was built by the Portuguese, who adorned it with several fine edifices, churches, and monasteries, to which belonged fine walks and pleasant gardens. The jesuits church and college faced the sea-shore, and had a lofty steeple. The convent and church of the Austin friars stood upon the bank of the river. The cathedral was a noble piece of architecture; and the convent and church of the Dominicans were fine buildings, beautified with a double row of pillars of excellent stone.

This city is so pleasantly situated, that the Portuguese used to say, "China is a country to get money in, and Cochin a place to spend it in;" for the great number of canals formed by the rivers and islands make fishing and fowling very diverting, and the mountains are well stored with game.

The Dutch took this city about the year 1662, by the assistance of several neighbouring princes; the king of Cochin, in particular, who had been exasperated at the insolence of the Portuguese, besieged it with twenty thousand men. The English had then a factory in the city, but were obliged to remove. It was then a mile and a half long; but the Dutch immediately gave orders for demolishing great part of the houses, and several of the churches, in order to add to its strength, and render the fortifications more regular. Thus it is now only about six hundred paces long, and two hundred broad; yet it is fortified with seven large bastions, and curtains so thick, that two rows of large trees are planted on them for shade in the hot season. Some streets, built by the Portuguese, were lately standing, with a church for the Dutch service, and the cathedral is now turned into a ware-house. The commander's house, which is a stately structure, is the only house built after the Dutch manner, and the river washes a part of its walls. Their flag-staff is placed on the steeple of the cathedral, on a mast seventy-five feet high, on the top of which is another about sixty feet; thus their flag may be seen at above seven leagues distance. The garrison generally consists of three hundred effective men.

Old Cochin, in which the king resides, has a bazar, or market, in which may be found the produce of the country. It is built on the banks of the river, and has several pagodas.

This place is remarkable for having been formerly the seat of a Jewish government, that people being once so numerous in this kingdom, that they amounted to above eighty thousand families, which at present are reduced to about four thousand. They have a synagogue about two miles from the city, in which are carefully kept their records, engraved in Hebrew characters on copper-plates, and can shew their history from the reign of Nebuchadnezzar to the present time. About the year 1695 M. Van Reede had an abstract of their history translated from the Hebrew into Low Dutch. They declare, that they are of the tribe of Manasseh, a part of which was by the above haughty conqueror, carried to the most eastern province of his large empire, which it seems extended as far as Cape Comorin; and, it is said, they spent three years, from the time of their leaving Babylon, in travelling thither. On their entering Malabar they met with a friendly and hospitable reception;

the inhabitants allowed them liberty of conscience, the free use of their reason, and of the power of exerting their industry. Hence they increased in number and in wealth, till at length, either by their policy or their riches, or by both united, they obtained the little kingdom of Cranganor; when one family among them being highly esteemed for their wisdom, power, and wealth, two of the sons were chosen by their elders and senators to reign jointly over the people. But concord, the strongest band of society, being soon broken, ambition took place, and one of the brothers inviting his colleague to a feast, quarrelled with him, and, basely slaying him, reigned alone till the son of the deceased revenged his father's death, by killing the fratricide, and thus the state fell again into a democracy, which still continues among the Jews settled there. But the lands have several ages ago returned back into the hands of the Malabars, and poverty and oppression have induced many to apostatize.

Farther to the south is Anjengo, where the English have a fort, secured by the sea on one side, and a small river on the other; but not a drop of water fit for drinking is to be had within less than three miles of the factory.

This place is subject to the queen of Attinga, who is the hereditary sovereign of a small territory. By the constitution of the country it must be always governed by a queen. It is against the law for her to marry; but that heiresses of her blood may not be wanting, she may choose to admit whom, and as many as she pleases, to the honour of her bed; her seraglio is therefore generally composed of the handsomest young men of her court. The sons have the rank of nobility, and none but the daughters have any title to the succession.

The custom of the women not being allowed to cover any part of their breasts, so generally practised in the countries of Malabar, is here more rigorously observed than in many other places; and we are informed by Mr. Grose, that a woman of that country, who had been some time in an European settlement, where she had conformed to the fashion, continued the concealment of her breasts; but coming into the presence of the queen, she ordered them to be cut off, for daring to appear before her with such a mark of disrespect to the established manners of her country.

To the south of Anjengo is Tegapatan, where the Dutch have a settlement near Cape Comorin.

Thus we have finished our intended description of India in general, and of the principal settlements on the coast, and shall conclude with an observation from an ingenious author, that from such strange customs as have been just described, it seems natural to infer, that a barbarism reigns among the Malabars equal to that of the savages of America; yet this is so far from being true, that they are distinguished by their politeness, and especially by a shrewdness in discerning their own interest, which those who treat with them are sure to experience. Like most of the people of the East they are grave, know perfectly well how to keep up their dignity, and are great observers of silence, especially in their public employments, for they despise and distrust all verbosity in the management of affairs of state, and their harangues are concise and pathetic. Thus two ambassadors being sent by the naick of Madura to the king of Travancore, whose dominions are situated by those of the Samorin, one of them making a long speech, and the other preparing to resume it where the other had left off, he austere admonished him in these words, "Do not be long, life is short."

We have now completed our view of India, and should next proceed to Persia; but as we have already given an account of the islands to the east of Cape Comorin, we shall first give a concise account of that amazing cluster of islands called the Maldives.

C H A P. XXIII.

Of the MALDIVIA ISLANDS.

Of their Situation, Extent, Number, and Produce; the Persons and Manners of the Inhabitants. With a concise Account of the Settlement of the Portuguese there, and their Destruction.
